A new corporation have been organized under the laws of Maine, to be known as the Dover Stamping & Mfg. Company. They have bought of Josselyn & Co. the old plant formerly owned and run by the Dover Stamping Company, Cambridge, Mass. The new company will be officered as follows: President and general manager of the corporation, Richard L. T. Evans, formerly with the Fairbanks Scale Company; treasurer and manager of the manufacturing department, Edward H. Whitney, son of the founder of the original Dover Stamping Company, which started in Dover, N. H., some 40 years ago, moving to Cambridge in the sixties. The new concern will continue the manufacture of the same line of goods as formerly made by the Dover Stamping Company.

New Aluminum Alloy.

Walter Rubel of Ludwigsburg, Germany, has obtained a patent in the United States on a new alloy, to improve the technological properties of aluminum without increasing its specific gravity. A proportion of 4 to 7 per cent. phosphorus is added to the aluminum, by which, it is claimed, the density and firmness are increased and a tough substance is obtained. An alloy of aluminum with phosphorus containing the above mentioned proportion of the latter gives a sharp defined casting, and only contracts to the extent of 1 to 1½ per cent. at the utmost, and the color is not blue, as is the case with alloys of aluminum and magnesium, but silvery. The alloy does not easily oxidize and can be soldered.

TRADE NOTES.

THOMAS M. MADLEY and others of Fairport, N. Y., are organizing a company with a capital of $50,000, to erect a Brass foundry at Clyde, N. Y.

THE ASTORIA BRASS COMPANY of Astoria, L. I., have been incorporated with a capital of $3000. The directors are George J. Warmbold and Gustave Schroeder of Hoboken, N. J., and Bernhard Schroeder of Fordham, N. Y.

THE AMERICAN NICKEL WORKS, Philadelphia, Pa., have been incorporated with a capital of $5000, by Joseph Wharton, Roger Haydock, J. B. Lippincott and Harrison S. Francis, all of Philadelphia.

W. H. MULLINS of Salem, Ohio, manufacturer of Metal Rowboats and Skiffs, is securing business from all parts of the world. He has recently shipped Boats to St. Petersburg, Russia; Soudan, Egypt; Madras, India, and other foreign points. If desired, these goods are made in sections so that they can be taken apart and stored in a very small space. Catalogues just published describe his various productions.

JEFFERSON METAL WARE COMPANY, Louisville, Ky., have been organized with a capital stock of $20,000. The stockholders are W. T. Hale and J. J. Morris of Louisville, and C. G. Summers of New Albany.

THE C. L. CHAPMAN CREAM SEPARATOR WORKS of Erie, Pa., have been incorporated with a capital of $41,000. The directors are: C. L. Chapman, J. T. Fletcher and E. T. Moore of Erie, and D. McGraw of Little Falls, N. Y.

PERFORATED METALS
STEEL, IRON, COPPER, ZINC, BRASS, TIN, and all other metals
PERFORATED AS REQUIRED for
Grain Cleaning and Mining Machinery, Woolen, Cotton, Paper and Pulp Mills, Rice, Flour and Cotton Seed Oil Mills, Sugar and Malt Houses, Distilleries, Filter Presses, Stone, Coal and Ore Screens, Brick and Tile Works, Filters, Spark Arresters, Gas and Water Works, Oil, Gas and Vapor Stoves, Coffee Machinery, &c., &c.
Standard Sizes Perforated Tin and Brass Always in Stock.
The Harrington & King Perforating Co.,
217 North Union St., CHICAGO, ILL., U. S. A.
NEW YORK OFFICE, 114 Liberty Street.

CLASSIFIED LIST OF ADVERTISERS.

Acetylene Gas Burners.
Carroll, J. B., Chicago, Ill.

Acetylene Gas Generators.
International Heater Co., Utica, N. Y.

Aluminum Coated Sheet Steel.
Steel & Iron Aluminum Coating Co., Connellsville, Pa.

Aluminum Ingots.
Janney, Steinmetz & Co., Phila., Pa.

Aluminum Scrap Buyers.
Janney, Steinmetz & Co., Phila., Pa.

Aluminum Sheets.
Janney, Steinmetz & Co., Phila., Pa.

Architectural Ornaments.

FOR SALE.

☞ A valuable manufacturing property, situated at 23d and Smallman Streets, Pittsburg, Pa. Remarkably well located as to shipping facilities, consisting of new steel constructed building 118 x 154 feet, thoroughly equipped with suitable machinery and tools for working in sheet metals. This establishment has a long ground lease, on very favorable terms and a large trade that will naturally follow it. It is the only concern in the Pittsburg district, with all machinery, for making corrugated conductor pipe, eaves trough, ridge roll, etc. This is an opportunity to secure a bargain for one desiring a business, that can be operated at once. Any one caring to investigate, with object of buying the building, machinery, etc., or any practical party, with capital caring to take an interest in the business, please address

H. L. IRWIN, Receiver for
Marlin & Co., Inc.,
Pittsburg, Pa.

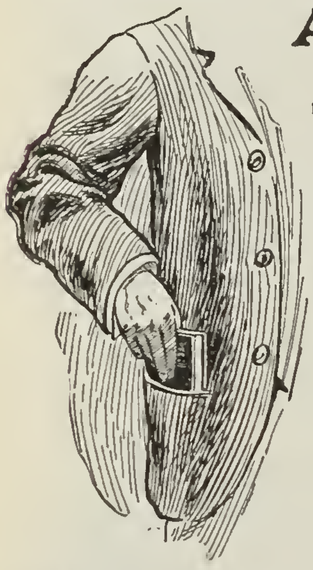
Price, Five Dollars.

DAVID WILLIAMS COMPANY
Publishers,
232-238 William Street, New York.

TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION



A USEFUL hand-book for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths. A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, $1.00 Postpaid

BATES-HAWLEY PATENT.

A POSTOFFICE AT YOUR DOOR

THE SIGNAL MAIL BOX, Bates-Hawley Patent, IS THE ORIGINAL BOX FOR RURAL SERVICE. It has been especially recommended by the Postmaster General

It is the largest, and the only box full government size, 18 in. x 6½ in. x 11½ in., and the only one which meets all the requirements. 7½ million dollars just appropriated for extension of rural service this year. From 100 to 1,000 boxes will probably be put in in your vicinity. You should sell them. Write us for prices.

SIGNAL MAIL BOX CO., 101 Benton St., Joliet, Ill.

Sperry's Steam Kettles.

Made from very thick metal, without Stay Bolts, Joint packed in such a manner as to never need repacking. A little higher-priced than some, but they are safe and tight.

Patent Pending.

Iwan's Perfection Wire Conductor Pipe Hanger.

Best Hanger Ever Invented.

Why It is The Best:
1st. It holds pipe one inch from building to permit painting.
2d. It looks ornamental.
3rd. It can be used for frame or brick buildings.
4th. It can be used for round or corrugated pipe.
5th. It completely encircles the pipe, holding it firmly on all sides.
6th. It is strong and durable.
7th. It is cheaper than any other hanger.
8th. A tinner can put up more pipe in less time than with any other hanger.

The hanger can be tightened as desired by giving the eye a twist. For 2-inch corrugated pipe 2½ inch hanger is required Other pipe runs uniform.

Also Manufacturers of Iwan's Chimney Top.

BLACK ASPHALT ROOF PAINT

It is used extensively in every State in the Union. It withstands extreme heat or severe cold, and has a tenacity and elasticity peculiarly its own. It is ready for use, easily applied, protects and preserves any exposed surface.

For Tin and Iron Roofs, also Bridges, Gas Tanks and Underground Pipes

This Paint has never been equaled. **TIN ROOFS**, even when rusted, broken and leaking, can be rendered water-tight and serviceable ; our Asphalt Roof Paint and Cement fills up holes, breaks, joints, and by its elastic and tenacious qualities keeps the roof tight.

STOWELL MFG. CO., - - Jersey City, N. J.

Look to the Future

WHEN CONSIDERING THE ROOF.

The material that contains the best weather-resisting qualities and that which will WEAR the LONGEST should receive the FIRST and ONLY CONSIDERATION.

That material is

ALUMINUM COATED SHEET STEEL.

The most durable coated sheet on the market As much superior to the galvanized as the galvanized is to the black. Can be soldered with common solder.

STEEL & IRON ALUMINUM COATING CO.,

Connellsville, Pa.

ALUMINUM COATED STEEL

FILLS A LONG FELT WANT.

Every tradesman who works in sheet iron has been for years deploring the fact that the quality of Galvanized Steel has been steadily getting worse and worse. Customers have been complaining that repairs are necessary too soon and too often. The time has come when you prefer to use anything else. Copper is too expensive, genuine Galvanized Iron too scarce and costly. Here is the very material you need. Aluminum Coated Steel will last as long as Copper, is better than Galvanized Iron, and costs less than either. Moreover, it will not rust, crack or peel off, can be double seamed without breaking, solders as freely as Galvanized, and, as it will stand any degree of heat without injury, is the only material fit to use for furnace work. Send us a trial order and satisfy yourself that at last you can be free from the annoyances that accompany the use of Galvanized Steel.

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.

DAVID WILLIAMS COMPANY,

Publishers

232-238 William St., New York.

A Plain Talk About Metal Ceilings.

THE MATTER OF PRICE.

It costs more to put up artistic designs than to produce those that any one could lay out with a straight edge and a pair of dividers.

It costs more to clearly and perfectly stamp a design, than merely to give the plate "a lick and a promise."

It costs more to produce deep-stamped material than to produce shallow stampings.

The question is not merely what you pay, but what you get for the money. We stand ready to give our customers the right kind of service, both as to quality of goods and price.

Some rooms require more elaborate, bolder. or deeper stamped designs than others. We are prepared to meet all these requirements; our stamping is done right in either case.

Almost any one will, in the long run, be best satisfied with

BERGER'S "Classik" CEILINGS

BERGER'S METAL CEILINGS TRADE MARK

We sell them at a reasonable price; but if something cheaper is wanted, we can furnish a neat miscellaneous design, and at as low a price as any good metal ceiling can be had for.

Don't be fooled; quality for quality, no one can give more advantageous prices than we can. Try us and see.

CEILINGS

Cornice

Roofing

Registers

Conductor

When accepting the agency for a line of Ceilings, remember that time means money to you, and if it takes twice as long as necessary to erect a cheap metal ceiling because of faulty construction, what matters a few cents difference in the original price?

You depend on making your profits by the time it takes to put the ceiling in place. Get "Canton" Metal Ceilings and you will have a winner.

They are artistic in design, and are easy to apply because all parts match perfectly, alignment is straight and regular and joints are tight fitting, requiring no putty to close cracks, which will mean a saving to you of 50% in labor.

Let us demonstrate what we say. Give us a trial order and others will follow.

A. L. PEDERSEN & CO.
321 E. 35 ST. CHICAGO. U.S.A.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
  1. MITER CUTTING.
  2. FLARING WORK.
  3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

THE ELECTRIC CITY GUTTER FORMER.
THE DOUBLE TRUSS CORNICE BRAKE CO.

New In Principle.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

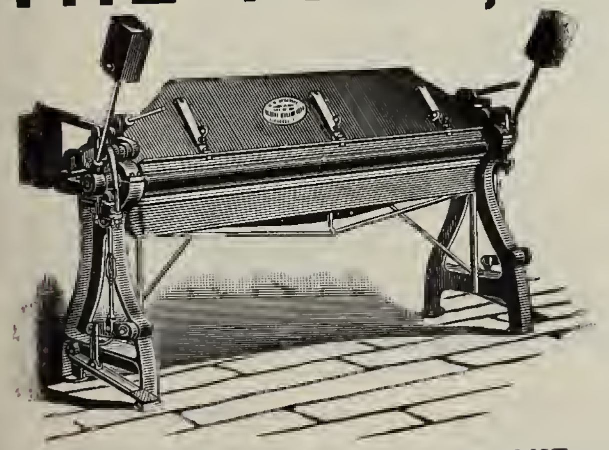
THE PECK, STOW & WILCOX CO.

New York,
—AND—
Cleveland, Ohio.

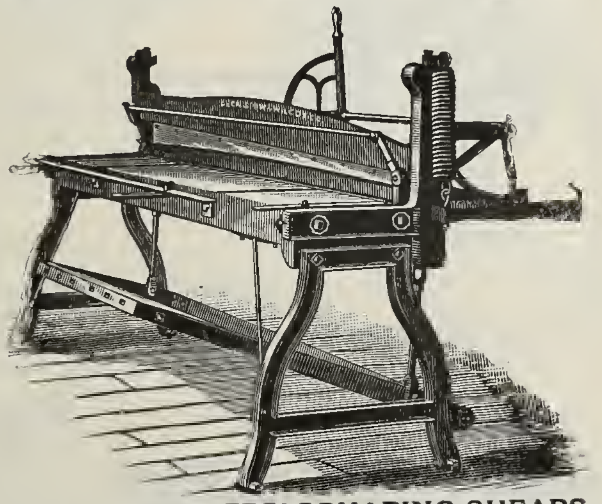
Tinsmiths' Tools of the Highest Grade.



HARE'S FOUR LEAF CORNICE BRAKE.

Hundreds sold and never a complaint. Works easily and rapidly. The universal verdict is, IT IS THE BEST IN THE WORLD. **96 inches long.**

Our *Improved Eureka Cornice Brake.* Will bend No. 20 iron. **96 inches long.**



CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 2 iron. **97 inches long.**

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

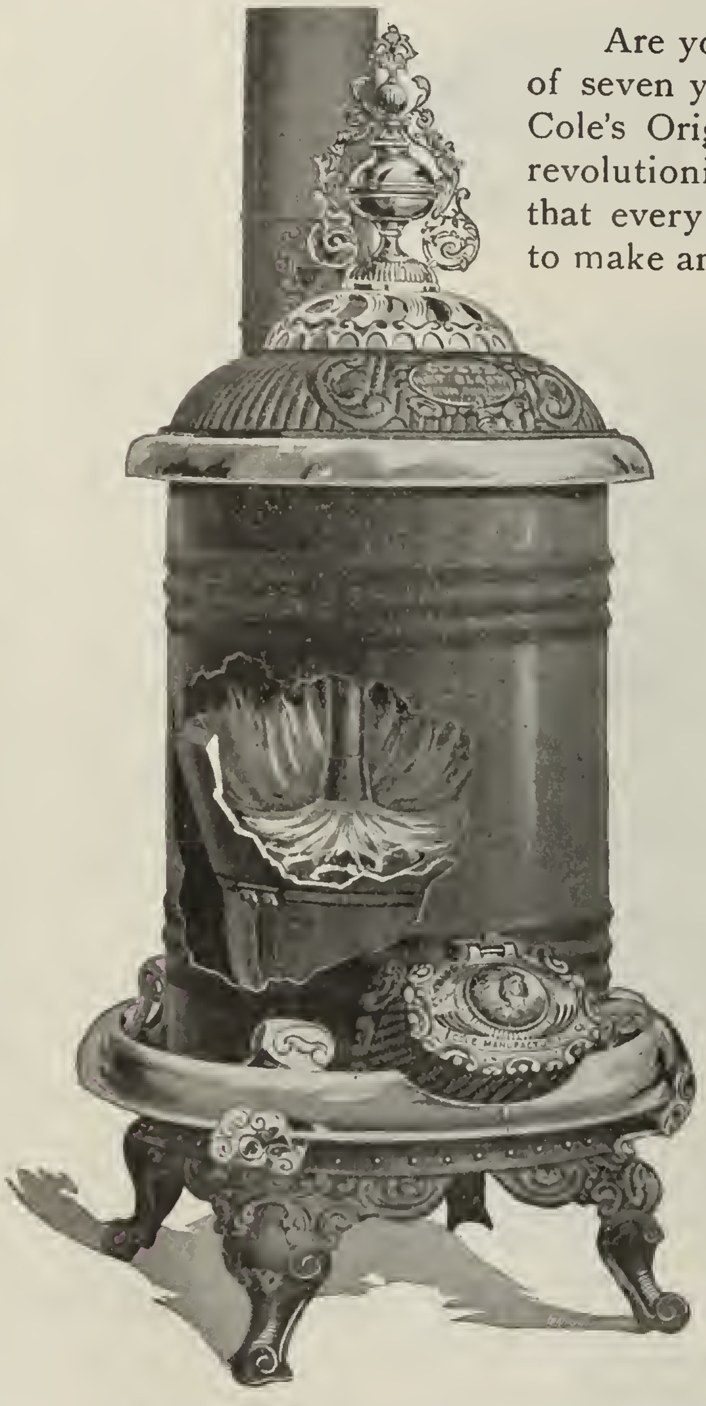
NEW YORK. BOSTON. CHICAGO. DENVER.

COLE'S ORIGINAL

Hot Blast Coal Stoves.

FROM CHICAGO.

Five sizes and three different grades, all guaranteed to remain Air-Tight as long as used. . . .



Shows No. 185 line, 14 ga. body and boiler plate water-tight bottom.

Are you not now convinced that our prediction of seven years ago has been fulfilled—namely, that Cole's Original Hot Blast stove would completely revolutionize the construction of coal stoves and that every stove manufacturer would be compelled to make an imitation?

It is up to you to choose between **The Oak,** which at best will only have a limited future sale, **an imitation** of our stove, which is still an experiment even to the manufacturer turning it out, or **COLE'S ORIGINAL HOT BLAST:**

Which makes $2.00 soft coal equal $8.00 hard coal,

Which gives even heat and cleanliness with cheap soft coal, the people's fuel,

Which is guaranteed to stay air-tight as long as used,

In which the fire is never out with any fuel, even corn cobs,

Which gives better results and greater economy with hard coal than any base burner,

Which will hold fire for thirty-six hours with wood,

Which is built on truly scientific principles and protected by patents that cannot be used in the construction of any imitation

If you will make up your mind to begin pushing our stove vigorously this year you will control the stove trade of your town for many years.

OUR POSITION

The familiar story about the shield at the roadside and the two knights errant approaching it from opposite sides and exclaiming, the one: "It is silver!" and the other: "It is gold!" reminds one of Heating Apparatus.

We Manufacture

Hot Water Heaters,

Low Pressure Steam Boilers,

Warm Air Furnaces.

The advocates of each line swear by its merits. Perhaps, like the knights of the story, they are right.

Like a man who fixed a place for his neighbor's hens to lay, we enter no protest.

We manufacture all kinds of heating apparatus and we are in a *POSITION* to supply you with the most comprehensive line of each kind in the world.

A Word to the Wise is Sufficient!

HERO.

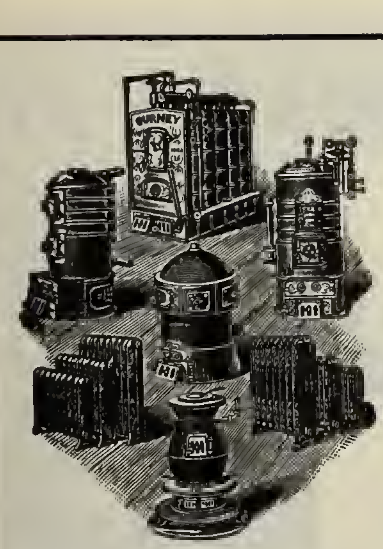
The **Wise Dealer** should keep in mind **these words,** viz:

FAULTLESS Furnaces,
HERO Furnaces,
COMFORT Furnaces,
RIVAL Furnaces.

They speak for themselves, and have been **talking** for years in many places. If **YOU** have not heard from them, now is the time to give them a chance

The GRAFF FURNACE CO.,

MANUFACTURERS,
208 WATER ST., NEW YORK.



YOU NEED THEM.

Some one has said "We need all and all need us." We're sure you need

"GURNEY" HEATERS, **Bright Idea, Doric and 400 Series,**

if you would make the most of your business, because the "Gurney" possesses those attributes which appeal strongest to heater buyers; the ability to cut down the coal bill, to furnish the largest amount of heat possible from the fuel consumed as well as the ability to wear several years longer than other heaters.

You may not be able to get business with some heaters, but the dealers who handle the "Gurney" never have any trouble. Weigh this fact carefully, then write for particulars relative to an agency.

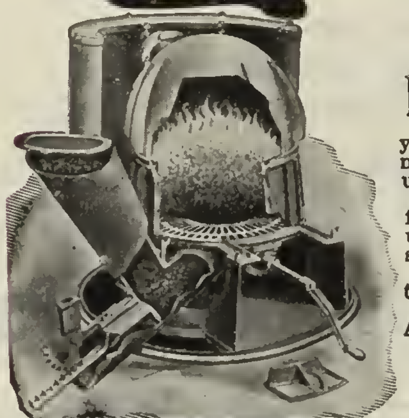
MILWAUKEE, WIS.



IF YOU ARE NOT SELLING THE

Peck=Williamson Underfeed Furnace

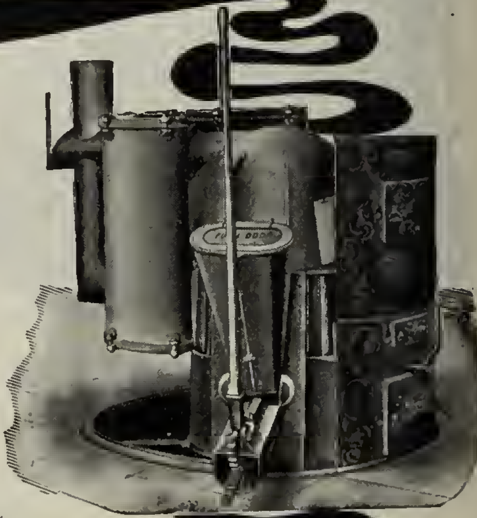
you have not the trade and are not making the money you might Just a pull or two of the lever feeds the new coal from underneath.

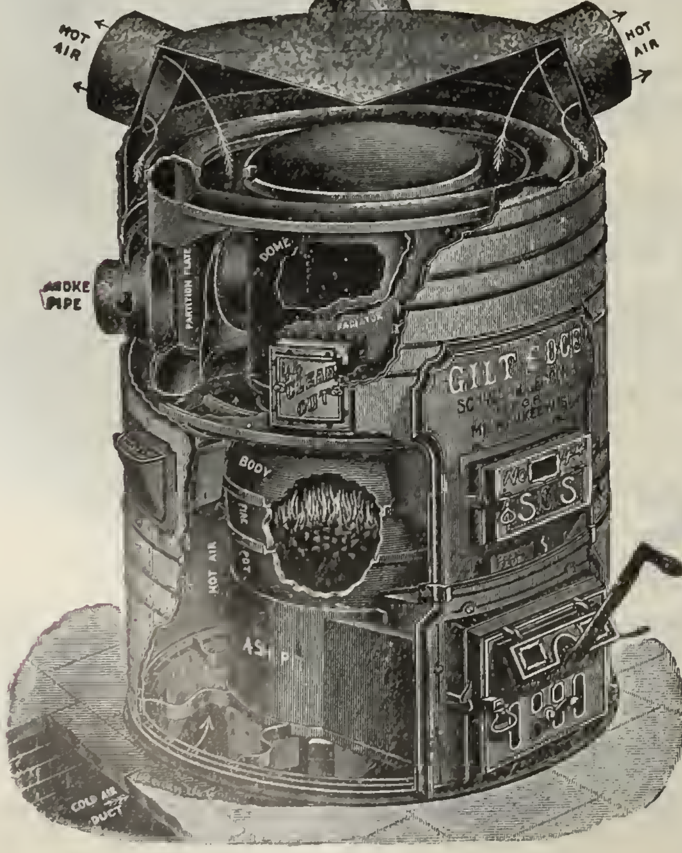
The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

THE PECK-WILLIAMSON COMPANY,
CINCINNATI, OHIO.





Gilt Edge Warm Air and Combination Heaters

have merits that are all their own. They are made in a large variety of styles and sizes, each adapted especially to a certain class of fuel. Our line is "gilt edge" in every sense of the word. Every furnace we make is correctly made in accordance with right principles, and the price is right. Kindly write us for catalogue.

S. L. FARRAR
PLUMBING AND FURNACE HEATING.

Dighton Furnace Co., Bath, Me., May 5, 1902.

Gentlemen: Yours of April 28th at hand, and in reply will say that I put in last fall four 22-inch fire pot "DIGHTON" Furnaces, and all worked satisfactorily. I have interviewed all of the users, and the greatest amount of coal used was four tons, the lowest three tons, and all speak well of them.

If I sell any furnaces this summer or fall I shall certainly use the "DIGHTON," and if, when I examine my own furnace this spring, I find it in bad repair, shall put a "DIGHTON" in my own house.

Yours Respectfully, S. L. FARRAR.

Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand, we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The *American Furnace* is made for the better class of trade; is durable, clean and economical in fuel.

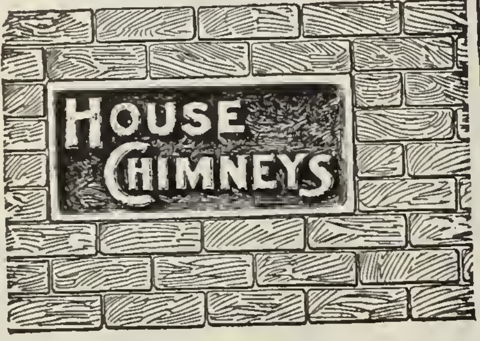
A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on *Chimney Troubles and Their Remedies* published under the title



Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house, chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

The Contents are as follows

Page.

POINTS ON CHIMNEYS · 7–32

An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.

DEFECTIVE FLUES · · · ·33–35

This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.

HOW TO IMPROVE A WEAK CHIMNEY · · · · · · 36–40

VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS 41–45

CONDENSATION IN STOVE PIPES · · · · · · 46, 47

SMOKE PIPE FOR WOOD FURNACES · · · · 48

REMEDYING DOWN DRAFT IN CHIMNEY · · · · 49–51

CONNECTED FLUES DESTROY DRAFT · · · · · · 52–55

FAILS TO BAKE ON BOTTOM 56–62

40 good Illustrations help to make the Text clear.

Price, Postpaid 25c.

The Climax
RATCHET STOCK

Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe takes 2 or 2⅛ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2⅛, 3 and 4 in. die, $17.00

ABOUT ESTIMATE BOOKS

For Plumbers and Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.
W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.
W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.
CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.
THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the "*CONTRACT AND ESTIMATE RECORD BOOKS*" come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

200 Pages. Arranged for 100 Estimates. Size 8 x 11 inches. Cloth bound, **$1.50**
500 Pages. Arranged for 250 Estimates. Size 8 x 11 inches. Cloth bound, **$2.50**

POCKET EDITION.

200 Pages. Arranged for 50 Estimates. Size 3½ x 8 in. (oblong). Flexible cloth binding, **$0.50**

CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates. 7 x 12 inches. Cloth bound, **$1.50**

NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, business-like record, and a sure means of avoiding loss due to mistakes and omissions.

Sent prepaid on receipt of price.

The Kelsey Warm Air Generator.

A HEATING APPARATUS with from nine to seventeen vertical corrugated cast iron flues, or Sections, forming the Fire Cylinder and Combustion Chamber, and having 65 square feet of heating surface to each square foot of grate surface.

Warms thoroughly and to the proper temperature great volumes of air, by passing it through the flues, and conveys it to every part of the building.

Provides heat and most perfect ventilation for Residences, Churches and School Buildings.

Accomplishes results which lead to further sales at satisfactory profits for the dealer.

Send for 164 Page Book of "Opinions." 20,000 in use.

The Stove Manufacturers.

The annual gatherings of stove manufacturers, which have taken place in various cities for more than three decades, have attracted less public attention than the meetings of the representatives of numerous minor industries. The manufacture of stoves is one of the oldest of our industries. As the country has been filling up with an increased population, stove foundries have sprung up close in the wake of the pioneer wherever fuel and iron could be advantageously secured. The result is that there are now a large number of stove manufacturing plants all over the country, representing the investment of an immense amount of capital and employing no small proportion of the working men of the country. This branch of the trade has been conducted with a freedom from friction which redounds greatly to the credit of those engaged in it. Since the organization of the National Association of Stove Manufacturers, the conflict of interests has been superseded by methods which have cemented the relations of all concerned, from the retail dealer to the manufacturer and his employees. Not the least important outgrowth of the National Association is the Stove Founders' National Defense Association, whose representatives meet periodically with a committee of the stove molders, and by wise measures have for many years avoided labor troubles. Their meeting in New York City this week has been largely attended, and the deliberations have closed with the same evidence of satisfactory results that has characterized the meetings in the past. That the representatives of such an important industry could meet with so little stir, so far as the general public is concerned, reflects creditably upon the confidence reposed in those who direct the operations of this great branch of business.

Pig Iron Production Still Increasing.

The monthly satistics of pig iron production published by *The Iron Age* show that the blast furnace capacity of the country has undergone another substantial increase during April, largely due to the starting of a number of furnaces in the East and in the South. The majority of these stacks serve the foundry trade, the production of the plants running on pig iron for steel purposes having already reached the present maximum. One very interesting fact is brought out by these latest statistics, and that is that for the first time in the history of the industry the enormous output of over 1,500,000 gross tons has been reached in one month, the exact figures being 1,503,326 tons. Notwithstanding this tremendous output, stocks of pig iron have further declined and are now at the lowest point reached in many years. The available furnace stocks on May 1 are given at 83,859 tons. This figure does not include the stocks now in hand of the steel works, but these also are said to have declined to relatively insignificant figures. If nothing happens to disturb the regular running of the furnaces, and if the old stacks now getting ready and the new ones building get into line, as expected, a production of 18,000,000 tons may be reached this year, in spite of the fact that that rate was not attained during the first quarter. The weekly productive capacity of the active furnaces on May 1 was 352,064 tons, as compared with 337,424 tons on April 1, 323,028 tons on March 1, and 301,125 tons on May 1, 1901.

A marked scarcity of pig iron continues and there are reports of foundries and mills closing down on that account. With the current scarcity of the raw material much attention is being given to the possible relief which is to come through the entry into the market of new stacks. A list of furnaces that are either likely to, or may, go into blast during the current year, given by *The Iron Age*, shows nine new stacks. Figuring conservatively, these may possibly add 300,000 tons to the production of the country for 1902. From present indications it looks as though the year 1903 would witness the starting of at least eighteen furnaces, the majority of large capacity. Of these quite a number will be making iron during the first half of next year. Roughly, it is estimated that furnaces which will start this year will produce about 3100 tons daily, and that the plants which are expected to go into operation in 1903 will reach a daily product of about 5500 tons, exclusive of seven prospective furnaces for the United States Steel Corporation and the Cambria Steel Company, which have not been taken into the account. It is possible that if these latter should be pushed and started into operation 3000 tons more per day might be added to the productive capacity of the country at the end of the year 1903. In other words, we may, in the fall or winter of 1903, find our productive capacity swollen by about 11,600 tons a day, or by 4,000,000 gross tons a year. This would indicate a possibility of entering 1904 with over 21,500,000 gross tons capacity per annum.

The West Indian Calamity.

Once in a great while occurs some overwhelming catastrophe which so overshadows all other events of the period as to make an epoch of its own. A calamity of this nature shocked the whole civilized world in the past week when the news was received of the cataclysm that had overwhelmed the city of St. Pierre in the island of Martinique. This disaster is the most destructive convulsion of nature that has visited the earth for a century and a half. The awful suddenness of a volcanic eruption which could almost instantaneously overwhelm and annihilate a city of 30,000 inhabitants and devastate miles of country can scarcely be realized. The further news that volcanic disturbances of a serious character, involving the loss of thousands of lives and an immense amount of property, have occurred in the British West India island of St. Vincent, with threatening of similar outbreaks in other contiguous portions of the chain of islands in the Caribbean Sea.

emphasizes the immensity of this latest outbreak of natural forces. We hear much in these days of the triumphs achieved by man over the forces of nature; but in the presence of such a catastrophe as this such boasting must be silenced. The brightest feature of the situation is the promptness with which the practical sympathy of the world has gone out to the suffering and starving people of Martinique. Supplies of money, clothing, food, medicines and all other necessaries are being rushed to the scene of disaster with the utmost rapidity possible. Prompt response has been made by the Congress of the United States to the news of the dreadful calamity. The appropriation of $200,000, to be immediately applied to the relief of the sufferers, is a generous and creditable manifestation of the sympathy felt by the people of this country, not only for humanity generally, but more particularly for the citizens of a sister republic, to whom we have in the past been bound by strong ties of affection and gratitude.

The Crop Outlook.

Unseasonable low temperatures throughout the West, with rain and snow in the Northwest, and especially dubious reports from the Red River Valley during the week, have in a large measure offset the effect of the favorable crop conditions previously existing and have been taken as evidence supporting the belief of a reduced wheat acreage. But while spring wheat seeding in the extreme North has been further retarded and the outlook there is less encouraging, the situation cannot be regarded as unusually unfavorable, considering the time of year. In the southern portion of the spring wheat belt the early crop is reported to be in good condition, but the general improvement noted in the condition of winter wheat by the Government Weather Bureau last week has been followed by less encouraging reports, and there is more or less solicitude concerning the crop in certain important sections of Nebraska, Kansas and Texas. On the Pacific Slope, while the crop is backward, its condition is generally promising. As a rule corn planting has made favorable progress in the Central States, although retarded in some other sections. With the more seasonable temperature now confidently expected, planting will proceed rapidly in the northern portions of the corn belt, where the soil is in fine condition. In the South favorable progress has been made, but rain is needed in the Southeast. The prospects in regard to other cereals and to hay are generally favorable, although news of a somewhat discouraging nature comes from portions of the West and South. The cotton crop, as a whole, is said to be in a good state of cultivation, and the outlook for this important crop presents no discouraging features. Taking the crop situation as a whole, no ground for apprehension exists at this stage of development.

Strikes in the Building Trades.

A decided check to building operations is noted in several parts of the country, owing to strikes of workmen in the building trades. In many instances these strikes have been settled by concessions made by the employers in the matter of higher wages or shorter hours. In other cases agreements have been reached between the employers and employed on the basis of mutual concessions, while in a number of instances the workmen continue idle on account of inability to reach an agreement with their employers. In view of the active condition of trade and of general business throughout the country, however, it is unlikely that many of the present labor disputes in the building trade will remain unsettled for any long period. The effect of these hindrances to building is already being felt in quite a number of distributing channels. Jobbers of plumbing goods, for example, note a marked falling off in the demand for plumbers' supplies, particularly in the East, and a similar condition of affairs is noted among the dealers in sheet metals and roofing supplies. In quite a number of instances contractors and others who have ordered goods for delivery by certain dates have requested that the deliveries be delayed until such time as the goods would be required for use. It is unfortunate that strikes should occur at a time when the outlook was so favorable for an unusually active building season. It is quite likely, if the strikes which now exist in various parts of the country are prolonged, that many projected building operations will be either abandoned or postponed indefinitely, particularly as the continued high price of some of the materials which enter into buildings already tends to prevent capitalists from undertaking construction work of a speculative nature.

Show Windows.

It has been obvious to those who have been giving any attention to trade methods that there has of late been a marked increase in the care with which merchants in almost all lines of trade have utilized their front windows for the display of goods and in various ways to attract custom to their stores. This fact has, indeed, secured recognition from the British Consul at Chicago, who in a report to the British Foreign Office refers to the trouble, expense and ingenuity which are used in having show windows well arranged. This is, indeed, referred to in connection with the mention of more grave and important matters which characterize American methods and contribute subsequently to the wonderful development of our business interests. The Consul's report might doubtless have gone further, and have made the point that houses enterprising and up to date in this regard are also prompt in adopting other methods which tend not only to increase the volume of their business, but to make it more profitable, as economy is secured wherever possible.

◆

It is just a year since a large portion of the city of Jacksonville, Fla., was devastated by the disastrous fire which destroyed 2368 buildings, entailing a loss of about $15,000,000, against which there was less than $6,000,000 of insurance. Since that time permits have been issued for the erection of 2109 new buildings in the city of Jacksonville, estimated to cost $12,650,000, most of which are to be put up in the burned district. Considering the circumstances, this is a splendid demonstration of the energy and courage of the citizens of Jacksonville.

The factory of the Lalance & Grosjean Mfg. Company, at Woodhaven, L. I., has just been equipped with an immense electrical illuminated sign 200 feet long, with letters 8 feet high. The sign can be easily read at a distance of 2 miles, and the illumination is visible at a considerably further distance. When it was first lit the effect was so striking that many people thought a fire had broken out at the factory. The sign is attracting much attention, as it is in full view of passengers by the trains running to Coney Island. It is one of the largest advertising signs of its kind in the country.

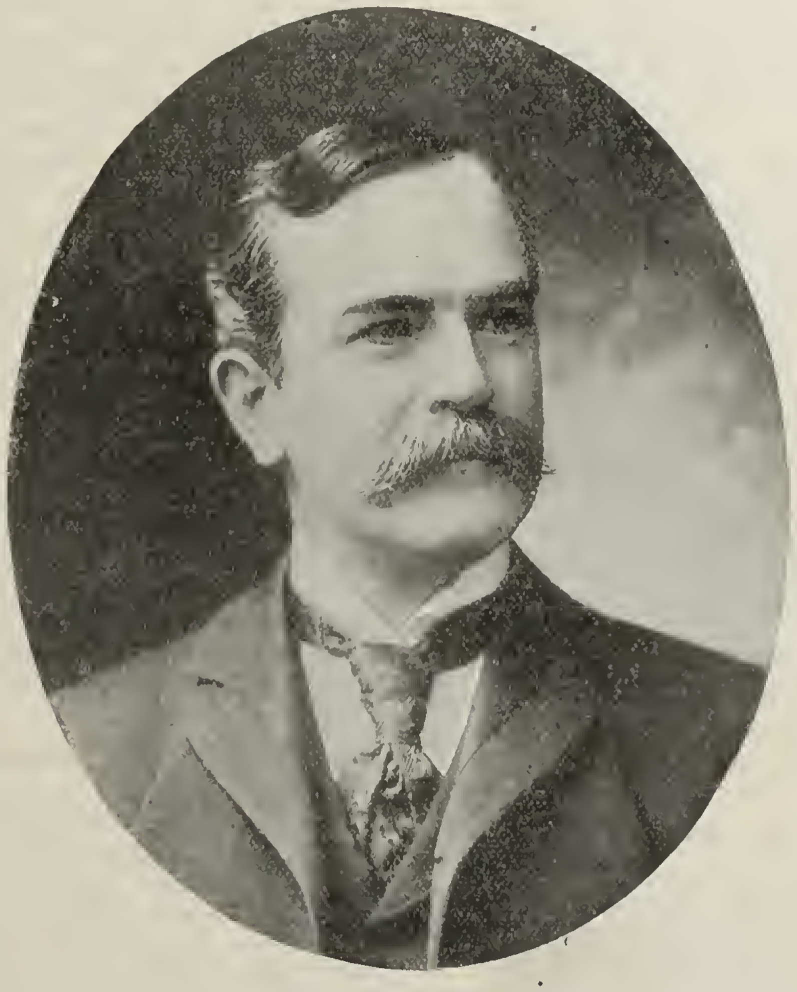
An international congress on Cheap Dwellings is to be held in Dusseldorf, Germany, from June 15 to 19 of this year, in connection with the Exhibition of Industry at that place. The last congress on this subject was held in Paris in 1900. An invitation has been extended to the United States to be represented at the congress.

The National Association of Stove Manufacturers.

THIRTY-FIRST ANNUAL CONVENTION.

THE delegates to the thirty-first annual convention of the National Association of Stove Manufacturers, the opening session of which was held at the Waldorf-Astoria in this city on Wednesday morning, May 14, came together under most auspicious circumstances. The weather was charming, the gathering was large and thoroughly representative, the topics to be considered were varied, and there was altogether such a feeling of cordial good fellowship and friendly interest as to make the meeting memorable in the annals of stove conventions. It was without doubt the largest gathering of stove manufacturers ever held, and that the deliberations were expected to be of great interest to the trade was evidenced from the fact that representatives were present from a very wide section of the country. How far this interest was manifest may be gathered from the roll of delegates which we present below.

The members came together in the East Room of the hotel shortly after 11 o'clock, with President A. N. Parlin in the chair. In a few well chosen words he introduced Jacob A. Cantor, President of the Borough of Manhattan, who extended to the members of the stove association and their guests a cordial welcome to the city of the Greater New York. His remarks were thoroughly in keeping with the occasion and were received with manifest appreciation by his hearers.



ALBERT N. PARLIN,
President National Association.

WEDNESDAY MORNING.

As the members entered the meeting room each was given a card, on which he wrote his name and that of the concern he represented. These cards were then turned in to Secretary Hogan, thus furnishing an authentic record of the members present, as follows:

Representatives Present.

P. B. Acker, Union Stove Works, New York City.
George Alig, Home Stove Company, Indianapolis, Ind.
W. J. Anderson, Richmond Stove Company, Richmond, Va.
Wm. S. Andrews, Stamford Foundry Company, Stamford, Conn.
Lew. A. Anshutz, J. C. Bartlett Company, Pittsburgh, Pa.
E. W. Anthony, Smith & Anthony Company, Boston, Mass.
Lew. W. Baker, the Portsmouth Stove & Range Company, Portsmouth, Ohio.
S. R. Baldwin, Pittsburgh Stove & Range Company, Pittsburgh, Pa.
Geo. H. Barbour, Michigan Stove Company, Detroit, Mich.
W. H. Barker, Weir Stove Company, Taunton, Mass.
John L. Baxter, Baxter Stove Company, Mansfield, Ohio.
Chas. F. Belcher, Walker & Pratt Mfg. Company, Boston, Mass.
A. O. Bement, E. Bement's Sons, Lansing, Mich.
A. M. Blanchard, Rathbone, Sard & Co., Albany, N. Y.
Stanhope Boal, Favorite Stove & Range Company, Piqua, Ohio.
J. W. Boehne, Indiana Stove Works, Evansville, Ind.
Frank N. Brayer, Co-operative Foundry Company, Rochester, N. Y.
Jos. Brower, Avondale Stove & Foundry Company, Birmingham, Ala.
Wm. J. Brown, Indianapolis Stove Company, Indianapolis, Ind.
Ralph S. Buck, Bridge & Beach Mfg. Company, St. Louis, Mo.
J. A. Buckwalter, Buckwalter Stove Company, Royersford, Pa.
N. H. Burt, Great Western Stove Company, Leavenworth, Kan.
Geo. W. Butcher, Southard, Robertson Company, New York City.
Wm. R. Butler, Lehigh Stove & Mfg. Company, Lehighton, Pa.
H. W. Buttorff, Phillips & Buttorff Mfg. Company, Nashville, Tenn.
A. L. Canfield, Danville Stove Company, New York City.
Chauncey H. Castle, Comstock, Castle Stove Company, Quincy, Ill.
C. H. Castle, Comstock, Castle Stove Company, Quincy, Ill.
F. Cavanaugh, Roberts, Winner & Co., Quakertown, Pa.
Henry N. Clark, Henry N. Clark & Co., Boston, Mass.
Walter A. Clark, Phillips & Clark Stove Company, Geneva, N. Y.
Wm. H. Clark, Cortland Howe Ventilating Stove Company.
E. C. Cole, Cole Mfg. Company, Chicago, Ill.
E. B. Colby, E. B. Colby & Co., Jersey City, N. J.
A. Colquhoun, Quakertown Stove Company, Philadelphia; Roberts, Winner & Co., Quakertown, Pa.
Wm. Corry, New York City.
E. S. Coyne, Eugene Munsell & Co., New York City.
Wm. M. Crane, Wm. M. Crane Company, New York City.
Henry Cribben, Cribben & Sexton Company, Chicago, Ill.
D. T. Crowley, Peninsular Stove Company, Detroit, Mich.
Lafayette Crowley, Detroit Stove Works, Detroit, Mich.
R. A. Culter, Culter & Proctor Stove Company, Peoria, Ill.
Geo. D. Dana, Charter Oak Stove & Range Company, St. Louis, Mo.
E. E. Dickenson, Boynton Furnace Company, New York City.
C. A. Du Charme, Michigan Stove Company, Detroit, Mich.
Wm. A. Dwyer, Art Stove Company, Detroit, Mich.
John M. Dwyer, Peninsular Stove Company, Detroit, Mich.
J. W. Emery, Channon-Emery Stove Company, Quincy, Ill.
Wm. S. Essick, Orr, Painter & Co., Reading, Pa.
C. E. Evans, Dighton Furnace Co., Dighton, Mass.
John J. Fisher, Excelsior Stove & Mfg. Company, Quincy, Ill.
James Foster, Danville Stove & Mfg. Company, Danville, Pa.
H. J. Fueller, secretary Pennsylvania Stove Association, Reading, Pa.
A. C. Fuller, Scranton Stove Works, Scranton, Pa.
Thomas Fyans, Floyd, Wells & Co., New York City.
A. B. Gardner, Estate of P. D. Beckwith, Dowagiac, Mich.
Fred. W. Gardner, Chicago, Ill.
A. F. Glaessner, Union Stove Works, New York City.
Geo. E. Graham, James Graham & Co., San Francisco, Cal.
H. R. Gummer, Gem City Stove Company, Dayton, Ohio.
Chas. C. Heath, Chas. C. Heath & Co., Baltimore, Md.
W. G. Henry, Detroit Stove Works, Chicago, Ill.
Uriah Hill, Jr., Union Stove Works, Peekskill, N. Y.
R. W. Hillman, Floyd, Wells & Co., Royersford, Pa.
Thomas J. Hogan, secretary N. A. S. M., Chicago.
R. H. Horne, J. L. Mott Iron Works, New York City.
Alfred S. Hughes, Southard, Robertson Company, New York City.
W. F. Hyde, Brand Stove Company, Milwaukee, Wis.
Josiah Jewett, Jr., Jewett & Co., Buffalo, N. Y.
Nathan H. Jewett, Jewett & Co., Buffalo, N. Y.
Lazard Kahn, F. & L. Kahn & Bros., Hamilton, Ohio.
Sam. Kahn, F. & L. Kahn Bros., Hamilton, Ohio.
W. P. Kellogg, Belleville Stove Works, Belleville, Ill.; Kellogg & Stokes Stove Company, Denver, Col.
Joseph F. Kernan, Syracuse Stove Works, Syracuse, N. Y.
Wm. Kerby, Utica Heater Company, New York City.
A. J. Kirkland, E. B. Colby & Co., Jersey City, N. J.

J. L. Klemme, Quincy Stove Mfg. Company, Quincy, Ill.
F. V. Knauss, Portsmouth Stove & Range Company, Portsmouth, Ohio.
W. H. Koll, Victor Stove Company, Salem, Ohio.
William H. Landers, Syracuse Stove Works, Syracuse, N. Y.
James A. Lansing, Scranton Stove Works, Scranton, Pa.
F. P. Leonard, Dighton Furnace Company, Dighton, Mass.
J. J. Leonard, Toledo Stove Company, Toledo, Ohio.
J. M. Litchfield, Mt. Penn Stove Works, New York City.
Henry C. Littlefield, Littlefield Stove Company, Albany, N. Y.
F. Percy Loth, W. J. Loth Stove Company, Waynesboro, Va.
D. M. McAfee, Thomas White Stove Company, Quincy, Ill.
Wm. McAlpin, Bridge & Beach Mfg. Company, St. Louis, Mo.
John H. McClure, Phillips & Buttorff Mfg. Company, Nashville, Tenn.
James F. McKee, Pittsburgh Stove & Range Company, Pittsburgh, Pa.
John R. McKnight, Mt. Penn Stove Works, Reading, Pa.
M. B. McKnight, Mt. Penn Stove Works, Reading, Pa.
T. J. March, March-Brownback Stove Company, Pottstown, Pa.
L. S. Marting, Foster Stove Company, Ironton, Ohio.
C. H. Miller, Champion Steel Range Company, Cleveland, Ohio.
George Mitchell, Pittston Stove Company, Pittston, Pa.
J. F. Montgomery, Taunton Iron Works, Taunton, Mass.
Lewis Moore, Joliet Stove Works, Joliet, Ill.
R. L. Morley, Michigan Stove Company, Chicago, Ill.
Martin Moses, Southard, Robertson Company, New York City.
Abram C. Mott, Abram Cox Stove Company, Philadelphia, Pa.
W. J. Myers, Union Stove Works, New York City.
Eugene Munsell, Eugene Munsell & Co., New York City.
J. Allison Orr, Mt. Penn Stove Works, Reading, Pa.
J. P. Ouerbacker, O. K. Stove & Range Company, Louisville, Ky.
Albert N. Parlin, Magee Furnace Company, Boston, Mass.
E. W. Peck, Co-operative Foundry Company, Rochester, N. Y.
Charles S. Prizer, Prizer-Painter Stove & Heater Company, Reading, Pa.
Thos. J. Rankin, Abram Cox Stove Company, Philadelphia, Pa.
E. Raftery, Rathbone, Sard & Co., Aurora, Ill.
R. G. Rennold, Richmond Stove Company, Richmond, Va.
William Ritchie, Boynton Furnace Company, New York City.
John Rogers, Home Stove Works, Chicago, Ill.
L. D. Streeter, Corning Stove Company, Corning, N. Y.
F. V. Streeter, S. M. Howes Company, Boston, Mass.
Frederick Sabin, Thomas, Roberts, Stevenson Company, Philadelphia, Pa.
Fred. Sattler, Belleville Stove Works, Belleville, Ill.
C. D. Shepard, Wm. M. Crane Company, Peekskill, N. Y.
Howard R. Sheppard, Isaac A. Sheppard & Co., Philadelphia.
Otis W. Snyder, Lexington Stove Works, Lexington, Ky.
Wm. D. Snyder, Keeley Stove Company, Columbia, Pa.
W. S. Stevenson, Thomas, Roberts, Stevenson Company, Philadelphia.
F. P. Stone, Lord, Stone & Co., Otter River, Mass.
Henry Swartz, Chas. C. Heath & Co., Baltimore, Md.
E. H. Taylor, Jr., Isaac A. Sheppard & Co., New York City.
Henry Terstegge, Terstegge, Gohman & Co., Louisville, Ky.
O. G. Thomas, Taunton, Mass.
H. E. Thomas, E. Bement's Sons, Lansing, Mich.
C. H. Trowbridge, Duffy, Trowbridge & Co., Hannibal, Mo.
James H. Vahey, Plymouth Stove & Foundry Company, Plymouth, Mass.
John P. Vahey, Plymouth Stove & Foundry Company, Plymouth, Mass.
J. W. Van Cleave, Buck's Stove & Range Company, St. Louis, Mo.
Hermann Van Voorhis, Galusha Stove Company, Rochester, N. Y.
Wm. H. Van Wormer, J. Van Wormer & Co., Albany, N. Y.
H. A. Viets, Fuller-Warren Company, Milwaukee, Wis.
Geo. W. Wagoner, Floyd, Wells & Co., Royersford, Pa.
Arthur W. Walker, Walker & Pratt Mfg. Company, Boston, Mass.
W. E. Walker, Weir Stove Company, Taunton, Mass.
Geo. H. Warner, Wm. M. Crane Company, New York City.
James H. Warner, Stamford Foundry Company, Stamford, Conn.
Walter P. Warren, Fuller & Warren Company, Troy, N. Y.
Henry Wetter, H. Wetter Mfg. Company, Memphis, Tenn.
Wm. Wewers, Gem City Stove Company, Quincy, Ill.
Allen W. Williams, Pioneer Stove Company, Columbus, Ohio.
Fred. Will, Sill Stove Works, Rochester, N. Y.
R. S. Wood, Fuller & Warren Company, Troy, N. Y.
J. M. Woodruff, J. Woodruff & Sons, Salem, Ohio.
A. J. Wright, Abram Cox Stove Company, Philadelphia, Pa.
James M. Ruso, stenographer, Rodgers, Ruso & Kelly, Albany, N. Y.

The next item on the programme was the reading of the minutes, followed by the election of new members, after which President Parlin delivered his annual address, as follows:

President Parlin's Address.

It becomes my pleasant duty to welcome you, as members and guests, to the thirty-first annual convention of the National Association of Stove Manufacturers of the United States, an association whose age is ample justification for its existence, a compliment to the character of its membership and a monument to the wisdom and foresight of its founders. In accepting the honor of presiding over your deliberations I stated that you could easily have made a wiser choice; not that I would withhold my efforts or any ability I possessed from your service, but I feared that such talent as I had was not of the kind best adapted to the requirements of the position. I must, therefore, ask your kind indulgence and forbearance during the deliberations of this body at this time.

We have under close review for our future guidance the first year of the twentieth century. It has been a year of great prosperity for our country and the industry we represent has enjoyed, perhaps, its full proportion. It is undoubtedly true that more heating and cooking apparatus was made and sold in the United States during the past year than ever before in the history of our business. The margin for profit, however, constantly decreases. Nevertheless, we may congratulate ourselves upon finding our profit and loss balance on the right side of the ledger. This is owing, largely, I believe, to the influence emanating from this body through the local associations it has created and fostered.

OUR PRODUCING CAPACITY.

The past few years have demonstrated that while a condition could exist, and did exist, that made a serious shortage in manufacturing capacity in many lines of industry, our ability to produce stoves is so much in advance of the natural demand that an abnormal requirement, such as occurred in 1899, caused us no serious embarrassment, and the demand was readily supplied. We can learn but one lesson from this—namely, that our surplus capacity, unless intelligently handled, will destroy the profit under ordinary conditions, and our energy and capital will be inevitably wasted.

We are now nearing, if we are not already at, the crest of the present wave of national prosperity. To change the simile we may liken the present period to the highest peak of a mountain range. It is our proud privilege to have come up from the valley of hard times and profitless business to our present position, an eminence never before attained, where we can look back upon lower peaks heretofore reached and the dark valleys between that we and others have traversed; but the mist of uncertainty veils our forward view. Have we reached the top? Is there a plateau where we may enjoy a season of comparative rest and prosperity? And if so, what is its extent? Of one thing we may be sure. There is a valley not far ahead, and we must be prepared to make the descent. As a united body, working wisely for mutual protection, we can do so in safety, but not otherwise.

CONSOLIDATION.

I apprehend that no greater or more useful work can be done by this convention than to consider this problem. Actual consolidation of interests by the formation of a so-called trust has had the attention of our members to a far greater degree during the past year than ever before. I am heartily in sympathy with any movement that aims to build up our particular industry along legitimate lines. Ours is a most noble calling. The comfort, the health, and, to a great degree, the happiness of the entire people are in our hands. It is a great responsibility, and he who so regards it and gives his life's best efforts to making the world better for his having lived in it, is entitled to some more substantial reward than the consciousness of having done his duty.

The history of consolidations in the past has shown that, to be successful, a high order of talent is necessary in the management. Those conceived by greed and born in the home of speculation have had, as a rule, but a short and sickly existence and had better never have seen the light. I can imagine an ideal condition; a combination of interests that would be invincible; where able and earnest minds, relieved from the petty annoyances of competition with one another, could be devoted to the improvement of the methods of manufacture and distribution of products, to the end that the consumer should procure better goods at lower prices than ever before, and yet capital and labor each receive its just reward.

THE PROGRAMME.

There has been placed in your hands a programme with subjects outlined for your consideration at this time, and I trust they will each receive your careful attention. Precedent may require me to address you somewhat at length on these and other subjects with which you are more or less familiar. I cannot hope to hold your attention as well, or impart the information that my abler predecessors have done, so shall not take the valuable time of the convention by attempting to do so, save in the briefest possible manner.

REDUCE THE PATTERN ACCOUNT.

Many notable successes in our trade have been achieved by those who have concentrated their efforts upon the manufacture of one article; and the conspicuous failures have been made by those who have over extended their lines in the foundry and pattern shop and sought distant markets for the distribution of their product. I, therefore, recommend for your consideration whether or not we cannot wisely reduce our pattern account, as well as our distributive expenses by confining our efforts largely to such territory as is contiguous to our foundries. We should naturally receive more or less business from all parts of the country through correspondence; but branch houses and a large corps of travelers attempting to sell New England goods in the West, and *vice versa*, will, in my opinion, in the long run, prove to be a delusion and a snare. For what shall it profit a man if he gain all the trade of his competitors and lose his own capital, to say nothing of his peace of mind?

THE INDUSTRY.

We have long led the world in the manufacture of heating and cooking apparatus. Our industry needs no protective tariffs, for nowhere are stoves made so well or sold so cheaply as in the United States. In this respect we hold the proud position of having led all other industries. But, alas! for our balance sheets, we make our goods so well and they last so long that the volume of sales possible is much restricted, and a profit that would be considered large on an article of daily consumption is not sufficient to pay the expenses absolutely necessary under present conditions to produce and market our product. I am, perhaps, threshing old straw in referring to these well-known facts, but I have felt that it was a subject that could not be too often impressed upon our minds and attention.

CHAUNCEY H. CASTLE,
President Defense Association.

THE YEAR.

Even the most casual review of the past year would be most incomplete if reference were not made to the many notable events that have occurred since we last met and which have kept this country continually in the eye of the entire world. Ae we were leaving our homes to attend this convention, the greatest catastrophe of modern times was visited upon an island adjoining our shores. We stand aghast at the horror, and our minds fail to grasp its extent, but our sympathy goes out in fullest measure, and our means are freely offered to help the survivors. When we were last assembled a panic occurred which shook the very foundation of the financial world and from which it has hardly recovered at the present time. But a few short months later an event took place which created a far greater shock because involving the entire nation and causing every citizen, however humble, to feel that he had sustained a personal loss. The tragic death of President McKinley, who has truly been called the best beloved of all the rulers of our land, cast a gloom over every city and village from Maine to Florida and from the Atlantic to the Pacific Coast. Of him, as of few, it could truly be said, " He has fought the good fight; he has finished his course; he has kept the faith. Henceforth there is laid up for him a crown of glory." Abler pens than mine have many times written his eulogy, but his best memorial will ever be in the hearts of his countrymen, whom he served with such fidelity and steadfastness of purpose.

SURVIVING NATIONAL CALAMITIES.

It is food for serious reflection that within the brief space of 40 years, in this greatest republic the world has ever known, where equal rights and privileges are the heritage of all, three of our chief executive officers, each born in the humbler ranks of life and rising by his own unaided efforts to the highest place of honor and responsibility, elected thereto by the suffrages of a free people, should have been slain by the hand of the assassin. Can it be that there is too much liberty in our beloved land? Is human nature too weak to be trusted beyond certain limits? Time alone can answer that question and we are not called upon to discuss it here.

A friend, writing to me recently, so aptly referred to one phase of this subject that I will quote his language, believing it will prove of interest:

> The President died, amid sincere public mourning. His successor was quietly inaugurated, and the national life went on with scarcely a flutter of the pulse or an accelerated heart beat. The national prosperity continued unchecked, and the world looked on amazed at the spectacle of a nation which could pass through such an experience and not have a single day of uncontrolled excitement, nor a serious attempt to unsettle values. From this incident we learn more than economists and academic students are able to teach us of the value of such alliances of interests as have grown up in this country among the master minds in finance, trade and industry. The New York Clearing House is the most conspicuous example of a beneficent "trust" ever known since the country was founded. Then, as more than once before in the history of the country, it held the tiller with a firm hand and guided the great flotilla of finance between the Scylla of popular apprehension and the Charybdis of speculative interests ready to wreck everything in the hope of profitable salvage. Such an object lesson was needed to show us upon how solid a foundation our unprecedented national prosperity is founded, and with how much of profound wisdom those who organized this government laid the basis of our social and political institutions.

THE SILENT MAJORITY.

Since we last met death has visited our ranks and taken a larger number than usual from our membership.

R. R. Finch of New York City; N. Brayer of Rochester, N. Y.; George W. Walker of Boston; G. H. Holland of

St. Louis, Mo.; E. Emrich of Columbus, Ohio; A. T. Henderson of Reading, Pa.; W. H. Shick of Reading, Pa., and E. W. Fiske of Boston have joined the silent majority during the past year. I regret that, with the exception of Mr. Walker and Mr. Fiske, my acquaintance with these gentlemen was very limited, and I suggest that a committee be appointed to draft suitable memorials, and that the same be inscribed on our records and become a part of the proceedings of this meeting. I desire to say a few words, however, in reference to Mr. Walker and Mr. Fiske, who for many years were my neighbors and friends, and of whom I can speak from personal knowledge.

GEORGE WILLIS WALKER.

George Willis Walker, at the time of his death one of the oldest stove manufacturers in New England, and president of the Walker & Pratt Mfg. Company of Boston, was born in 1827, in Exeter, Maine, near Bangor. He worked on his father's farm until he was 18 years of age, when he came to Boston to seek his fortune, entering the employment of a retail stove dealer. In 1853 he was employed by Fuller, Warren & Co. as a traveling salesman. After five years' service he took the agency of their goods and opened a retail store in Boston on his own account. From that time on his career was one of continued success. Subsequently, his business was united with that of Miles, Pratt & Co., foundrymen, and the present corporation of the Walker & Pratt Mfg. Company was founded in 1874. He had the respect and confidence of all who knew him. He held many public offices in Malden, where he resided, and represented the city in the State Legislature in 1885-1886, and served as Presidential Elector in 1892. He was an able merchant, a fair competitor and a sincere friend. His word was always as good as his bond.

EBEN WINSLOW FISKE.

Eben Winslow Fiske, secretary of the Smith & Anthony Company, who died on April 29, at Waltham, Mass., was born in that town May 22, 1860. He commenced business with the Smith & Anthony Company as a clerk, soon after graduating from the high school, in 1879, and as a result of his faithfulness was rapidly advanced from one position to another until he was made secretary of the company, which position he held at the time of his death. Mr. Fiske was an alderman of the city of Waltham for three terms, being president during his last term, filling the office with the fidelity and ability characteristic of the man. By his death the stove trade of New England has lost an associate who was honored by all who knew him.

THE LOCAL ASSOCIATIONS

The local associations, as I said at the beginning, are the real sources of our mutual helpfulness. Where a member of one association seeks trade in territory governed by another, of which he is not a member, great care should be taken to learn fully the rules adopted by the local association governing that territory before quoting prices or selling goods therein. Our secretary is always prepared and glad to impart this information, and simple good faith between ourselves requires that we rigidly observe this rule of conduct.

We are glad to welcome to-day, as guests, so many friends whom we should be pleased to enroll in our ranks. Let us strive to make the advantages of membership so evident that no manufacturer of stoves can afford to remain outside. In union is strength. Can we not easily find some common ground on which we can loyally and firmly stand, and so correct many of the abuses which have gradually crept into our business, and which, unless rooted out, may become fixed habits to control our future action? I allude to such matters as free blacking, freight allowances, free deliveries, allowances for goods broken in transit, advertising for customers, &c. And whatever we do, let us be true to ourselves and to each other.

The criticism has been heard in the past, that we, in convention, were too much like sign posts, pointing the way but never going therein. Let us prove the falsity of such an aspersion by making this meeting one long to be remembered for the helpful measures adopted, and for its wise legislation, as well as for the good fellowship displayed, and for which all our past meetings have been notable. No one values more highly than myself the social features of our convention life, but we must all agree that the opportunity should not be lost to do some good work for our common cause, so that year by years these gatherings should enable each of us to take a long step forward and upward toward a better way of business life and action.

PRICES AND FREIGHT CHARGES.

It seems hardly necessary for me, at this time, to impress upon you the importance of maintaining the prices fixed by the local associations. The cost of labor and of all materials entering into our productions has advanced to a point where it is impossible to sell stoves and like goods to-day at the prices that prevailed during the past year without positive loss to the manufacturer. Those who have not already secured their supplies for the year may indeed find it impossible, in the near future, to obtain their requirements.

The welfare of the association can be promoted by taking some action in reference to the present methods of classification of freight by the railroads. I recommend that a committee be appointed to take this matter up at once with the Transcontinental Freight Bureau. There is no good reason why, if we load and ship a full car of goods, we should be compelled to pay the rate for "less than carload" lots. But, under the existing rules, the railroad inspector is instructed to examine the contents of the cars, and, if a portion are stoves and the balance furnaces or any other goods carrying under their classification a different tariff rate, to change the billing and charge a "less than carload" rate for all. At the present time this rule does not apply to all parts of the country, but if we do not, as a body, protest against such an injustice I believe it will be but a question of time when it will be made to apply universally.

In closing, I wish to express my deep sense of obligation to our efficient secretary for his able and courteous assistance during the past year; to the Executive Committee, whose services have at all times been at the command of the members of this association; to our treasurer, and to the entire membership for the kind words and helpful suggestions which I have so often received, and which have made the honor of serving you one of the most pleasurable experiences of my life.

A Flourishing Association.

The remarks of President Parlin were followed with deep interest by the members, who at frequent intervals manifested their appreciation by heartily applauding. Upon the conclusion of the address Secretary Thomas J. Hogan rendered his annual report, showing the association to be in a most flourishing condition. What he had to say was still further emphasized by the financial report of Treasurer Walter S. Stevenson, which immediately followed.

Consolidation Discussed.

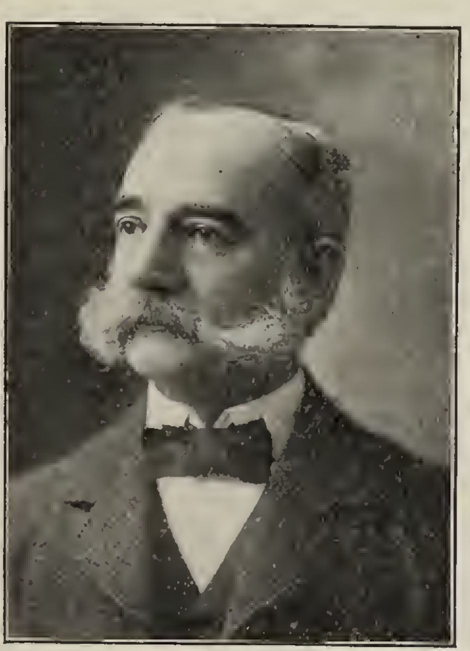
For some time past it has been intimated that one of the subjects likely to receive consideration at this meeting of the stove manufacturers was that of consolidation of certain interests in the trade. This supposition proved to be correct, the leading topic on the official programme being "Consolidation; Can It be Successfully Applied to the Stove Business? And, if so, Upon What Plan or Basis?" The discussion was opened by Lazard Kahn of Hamilton, Ohio, who, as is well known, has for some time past been at work upon such a project. It is equally well known, however, that the movement has not in any way been pushed under the auspices or by the authority of the National Association. The opportunity was simply given on this occasion for Mr. Kahn to present his views to a much larger audience of stove manufacturers than could be secured at any other time. Mr. Kahn was well primed with facts and figures relative to the stove business, and presented his views on the question in a most interesting and attractive manner. His remarks were closely followed by the members, who evinced a deep interest in all that was said. The discussion of the subject was still in progress when the session at 1.30 adjourned to meet again at 3 o'clock.

WEDNESDAY AFTERNOON.

A further increase in the already large attendance was notable when the afternoon session was called to order. The convention was in the spirit worthy of the important industry represented and unanimously, by a rising vote, conferred on Fred. W. Gardner the distinction of making him an honorary member of the association for life. This is a fitting recognition of the active interest and untiring effort expended for the welfare of the association. It afforded ex-President Stanhope Boal, who is well qualified by official association with Mr. Gardner, to bring to the attention of the members the many labors pursued by him persistently in the face of discouragement till the desired benefit to the association had been realized. Mr. Boal's remarks reflected earnest feeling and indelibly stamped the works of Mr. Gardner on the memory of the members. Other associates spoke to the same end, and that Mr. Gardner was overwhelmed with gratification and surprise is not strange. His response was a simple expression of thanks made very feelingly.

THOMAS J. HOGAN,
Secretary of National and Defense Associations.

The discussion at this session opened on consolidation, and whether due to the heat of the argument or to fiery oratory, it was abruptly stopped by a fire on the floor above. As J. W. Van Cleave was speaking at the time it is evidence of the force he brings to a debate. As water came pouring down into the room the meeting dispersed, some laughing that stove men should be afraid of fire and others joking about "already watering the stock." The fire being slight, the meeting was soon resumed and the discussion on consolidation closed with an invitation for those who were interested in the subject to meet in the room at 9 o'clock on Thursday morning.



WALTER S. STEVENSON,
Treasurer of National Association.

The discussion of "Pattern Expense" was then taken up, the general expression being that there should be retrenchment in this field. One member pointed out, however, that stoves were largely used by the women folks, who were accustomed to four styles of bonnets in a year, and it would not do to bring out but one style of stoves in four years if the stove trade was to keep up with the progress maintained in other branches of trade. This subject occupied the convention till adjournment.

THURSDAY'S SESSION.

The convention was called to order by President Parlin at 11 o'clock. Discussion of methods of cooperation for the general good of the trade resulted in the appointment of a committee to draft a resolution for preventing the invasion by members of the territory of the different local associations. The committee was composed of Abram C. Mott, A. H. Walker, Dr. Henry, Wm. J. Myers, F. D. Knouss and R. G. Rennolds. A resolution was presented and adopted defining the territory of the local associations.

ABRAM C. MOTT,
Treasurer Defense Association.

In discussing the advisability of sending representatives to hardware conventions, it seemed to be considered an expensive practice that was inadvisable and unnecessary and one that should be discontinued. The discussion of the use of malleable iron in stove construction was extended, and reflected the opinion that no benefit was derived sufficient to warrant the increased cost.

In considering the establishment of uniform selling prices on different types and grades of stoves it was suggested that the secretaries of the different associations meet to confer for this purpose at some time to be arranged by the National Secretary. The discussion on using the names of other stoves, whether as a prefix for trade-mark names or otherwise, was then taken up with a view to remedying a matter that has become serious and to be overcome. It was finally decided that the disadvantage was not of sufficient importance to do any special harm.

By a unanimous vote Cleveland was selected as the place for holding the next convention.

Election of Officers.

The old board of officers was re-elected unanimously as follows, notwithstanding the remonstrance of Fred. W. Gardner that an honorary member should not hold office.

President, Albert N. Parlin, Boston, Mass.
Vice-Presidents, Frederic W. Gardner, Chicago, Ill.; Frederick Will, Rochester, N. Y.
Treasurer, Walter S. Stevenson, Philadelphia, Pa.
Secretary, Thomas J. Hogan, Chicago, Ill.
Central Executive Bureau: J. W. Van Cleave, St. Louis, Mo.; J. W. Boehne, Evansville, Ind.; A. W. Walker, Boston, Mass.; W. J. Myers, New York City; W. H. Cribben, Chicago, Ill.

A very successful convention then adjourned *sine die.*

CONSOLIDATION.

On Thursday morning a fair representation of manufacturers held a meeting presided over by Lazard Kahn, to whom the subject of consolidation had been assigned in the official programme, and others speakers presented further views favoring the project. The purpose apparently was to ascertain who were sufficiently interested before any definite proposition was outlined.

Following the adjournment of the convention on Thursday afternoon an informal meeting was held, at which John W. Baker of Philadelphia presented his proposition for a consolidation of stove manufacturers. Mr. Baker's scheme had no connection with that proposed by Mr. Kahn.

Although the consolidation idea is undoubtedly favored by quite a number of the stove manufacturers, it has thus far failed to inspire enthusiasm or to receive the substantial support necessary to its accomplishment. Nevertheless, in view of the persistence with which it is brought forward for consideration, it would be unwise to make the positive prediction that a consolidation cannot be effected.

THE OUTSIDE CONVENTION.

H. T. Richardson, Dwight Corwin and W. M. Brinkerhoff held a session on the second floor corridor, unmolested. They spent the time in planning to add more supporters to their method of protecting the manufacturers' interest in an extension of the sale of stove repairs from their own plants and against the use and sale of repairs made from castings by the pirates.

Robert Galbraith of the Vedder Pattern Works, Troy, N. Y., has a new grate adapted for furnaces and boilers, which is being used by several stove manufacturers, and which he brought to the attention of many of the members of the association.

Thomas Austin, 567 Quincy street, Brooklyn, N. Y., showed a photograph of the newest thing in fire place heaters, which also heats an upper room, is a ventilator and an open fire.

John H. Sayres talked pig iron in the interest of Rogers, Brown & Co. of 71 Broadway, New York. Some wanted to know if Mount Pelée spouted any iron ore, and what the profit would have been if a pig bed had been ready to receive the run and whether it would have brought pig iron down to $9.75 again. Hard questions!

Secretary E. D. Frohman of the S. Obermayer Company, Cincinnati, Ohio, said nothing about the exhaustive line of foundry equipment and supplies the house can furnish, but simply enjoyed greeting old friends in this branch of the foundry trade.

Chester Bascom of the Vedder Pattern Works, Troy, N. Y., had many little confidential chats with stove men, probably in reference to new patterns and redressing old favorites. But these secrets will be made public later.

John McLaughlin, 215 North Second street, Philadelphia, reports some activity in pattern making for the stove trade. And he does not draw all of his patronage from Pennsylvania by any means.

Jos. Leon Gobeille of the Gobeille Pattern Works, Cleveland, Ohio, was found in many groups of stove men. All know that patterns for any class of goods can be got in Cleveland, although high grade goods are the kind for which the plant has built up a reputation.

D. M. Ireland and Charlie Matthews of the Ireland & Matthews Company, Detroit, Mich., were both at the convention to talk with old customers and friends on stove trimmings.

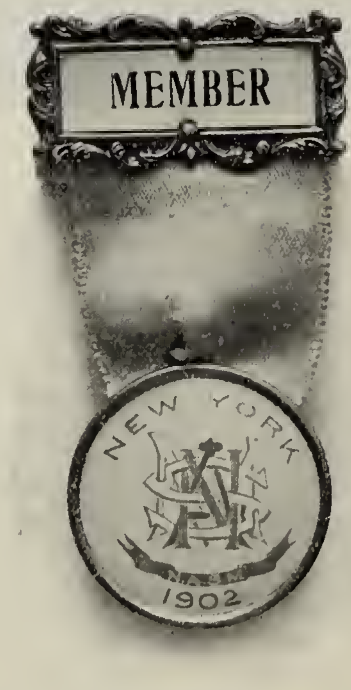
Henry Gleason, on his own stamping ground, while lending efficient aid in dispensing hospitality, had a word in season for his own specialties.

John E. Gaitley of the Troy Nickel Works, Albany, N. Y., leaves no impression of Alaska in the genial warmth of his fellowship. But the other fellow often leaves an order for Alaska specialties that is very impressive.

A. T. Matthews of the Matthews Mfg. Company, Worcester, Mass., dropped a few words now and then on stove knobs, trimmings, &c., when the social side afforded an opportunity.

Charles E. Evans of the Evans Stamping & Plating Company, Taunton, Mass., spoke of some new things for stove makers that are to come, and enjoyed meeting so many stove men in a bunch.

C. W. Miller of the Champion Steel Range Company, J. Scott of the Cleveland Co-operative Stove Company and W. Bates and S. D. Latty of the Kirk-Latty Mfg. Company of Cleveland, Ohio, distributed red, white and gilt buttons bearing the inscription, "N. A. S. M., Cleveland, 1903," to influence the members to accept the invitation of the Cleveland Chamber of Commerce to hold the next convention in that city.



BADGE OF MEMBERSHIP.

A whisper went around that St. Louis wants the convention in 1904, so as to make the Louisiana Purchase Exposition a success.

A. W. Bowman of the Russell & Erwin Mfg. Company, New Britain, Conn., brought greetings to the many customers of his house.

Uriah Hill, Jr., received many congratulations on the sixtieth anniversary of his wedding. He is a much younger looking man than many of his *confrères* who are not octogenarians.

The studio of Falk, the photographer on the fifteenth floor of the Waldorf-Astoria, was visited by quite a number of the stove manufacturers. It is beautifully appointed in the salon and perfectly equipped in the studio. Those who sat for Mr. Falk felt the enjoyment of making a new acquaintance rather than the constraint of having to submit to an ordeal. The portraits of the officers of the Stove Founders' National Defense Association were made in Falk's stdio.

Among the notable guests present at the smoker on Wednesday evening was John Patterson of the National Cash Register Company, Dayton, Ohio. Mr. Patterson has won well deserved fame among manufacturers for the admirable schemes devised for the betterment of employees which have been carried out under his direction to such a great extent in the works of his company. This was naturally a favorite topic of discussion whenever Mr. Patterson was introduced to a stove manufacturer, as everybody desired to get as much light on the subject as possible.

Frederic W. Gardner of Chicago, one of the vice-presidents of the association, was the recipient of a very high compliment at the session held on Wednesday afternoon. As a fitting acknowledgment of the services rendered the association by Mr. Gardner during his long connection with the stove trade ex-President Stanhope Boal presented a resolution making Mr. Gardner an honorary member for life, supporting his resolution in a speech which excited much enthusiasm. The resolution was seconded by another ex-president, Charles S. Prizer, who also eulogized Mr. Gardner and in the strongest terms set forth the desirability of this action. President Parlin followed in a similar strain. A standing vote was taken and the motion was adopted unanimously. The distinction conferred on Mr. Gardner is the more noteworthy from the fact that he is the first to be enrolled as an honorary member of this organization.

J. Q. A. Butler brought more than half a century of experience in the stove trade when he came up from Beekman street to the convention, and many of the members gave him a cordial greeting, taking pleasure in introducing him to a younger generation of stove makers, Mr. Butler is as young in spirit as any of them, and still attends to the details of the business that he conducts.

E. A. Ireland came on from his headquarters in the Auditorium Building, Chicago, to greet the stove men, as only he can, for the Matthews & Willard Mfg. Company, Waterbury, Conn., and the Harshaw, Fuller & Goodwin Company, Cleveland. Stove knobs, hinge pins, rings and edges are sold in large quantities by him for the former company which he represents in the West. For the latter company his friendly associations with the trade enable him to dispose of a goodly tonnage of nickel anodes to the shrewdest buyers. He placed an order for 4 tons on nickel anodes after talking with Thomas I. Rankin of the Abram Cox Stove Company of Philadelphia. Invite Ireland to see you if you want the latest was a suggestion well received by those who know him best.

Of all the happy Cleveland men none were more pleased than S. D. Latty of the Kirk-Latty Mfg. Company, Cleveland, Ohio, when Cleveland was selected as the place for holding the next convention. Does he feel that they have *riveted* their affection to the Forrest City and *bolted* from all others for a time?

Secretary Hogan displayed admirable taste in the design of the badge of the association, a cut of which is presented in this issue. The badge worn by a "member" were attached to a blue ribbon, while that worn by a "guest" had a red ribbon attached. The badge was neat, pretty and not too conspicuous.

Reference has been made to the record breaking attendance at this convention. This, however, is no new experience. Every year since Thomas J. Hogan became secretary the attendance has surpassed that of the preceding year. More convincing evidence could hardly be presented of his efficiency. During his tenure of office the influence of the association has grown stronger and stronger, aided materially by the development of local associations, in which his genius for organization has borne such fruitful results.

THE SMOKER.

The stove manufacturers of New York and vicinity tendered a "smoker" to the members of the National Association on Wednesday evening. It was held in the Astor Gallery of the Waldorf-Astoria, under the direction of the following committee: P. B. Acker, A. L. Canfield, G. W. Butcher, Eugene Munsell, Edward Bowditch, R. H. Horne, E. E. Dickinson, Henry T. Richardson, F. L. Sheppard and E. F. Hill. The occasion was a delightful one. The room in which the function was held was admirably suited to the purpose. Entertainment was provided in the nature of a *melange* of professional artists, as well as the usual refreshments accompanying an affair of this kind.

The smokers given by the New York stove men have greatly increased the attractions of the Empire City as a convention center for stove manufacturers. All the details were carefully worked out. The cigars bore gilded bands, having the letters "N. A. S. M.," in honor of the occasion. After the magicians had created feelings of envy by showing that absolutely no plant was necessary to manufacture handkerchiefs and the musician had played a violin solo on an ash pan, the following *menu* was served:

Bouillon in cups.
Lobster, Newburgh.
Chicken Salad.
Assorted Sandwiches.
Fancy Ices.
Cakes.
Coffee.

The enterprise of one of the vivacious stove men, who wears gray in his hair for effect, was displayed in an exchange of salutations with the sylph-like (?) prima donna. The man with the topical song gracefully alluded to Lazard Kahn as a man to be considered when a big enterprise is in hand; to George H. Barbour as an advocate of consolidation; to Fred. W. Gardner as a suitable subject for honors, and to A. N. Parlin as a president, *par exellence.*

When the fellow feeling was most kind a very pretty souvenir was distributed by the Kirk-Latty Mfg. Company of Cleveland, Ohio. It was silver from Gorham's and will be treasured. On one side was inscribed "Compliments of the Kirk-Latty Mfg. Company, Cleveland, Ohio," and on the other "Stove Bolts." It came in a box packed in cotton bearing Gorham's name. One of Mabie, Todd & Bard's best flat pencils was inclosed in a flat silver sheath so the point was protected and arranged to be reversed for use. A card requested that another pencil be sent for when needed for writing orders for stove bolts, rods, rivets, &c. It was one of the bright things that took the slime off anything that the artists on the stage got off.

The entertainment on the stage was pleasing, but the social spirit prevailed, and the visiting between the groups at different tables was continuous and by far the happiest feature of the affair. The enjoyment of these New York smokers has been such as to recommend their adoption as the best form of entertainment at conventions.

THE TRADE PRESS.

Cordial welcomes were exchanged between the different members of the trade press, who took pleasure in aiding each other in extending their acquaintance with the stove manufacturers and the manufacturers of supplies. The dean of press representatives was T. S. Bowman of the *Stove and Hardware Reporter*, St. Louis. Daniel Stern and Sidney P. Johnston of the *American Artisan*, Chicago, aided Mr. Bowman in representing the West.

The courtesies of the East were extended to their Western *confrères* by George W. Cope, Frank K. Chew and Henry Colwell, representing *The Metal Worker*. This branch also had an outside attendance in James C. Bayles, who is well known to the stove trade from his long connection with *The Metal Worker* and whose contribution to this issue will no doubt be read with greater interest as it is accompanied by a contribution by the irrepressible "Jeems," who was discovered by Mr. Bayles.

WALDORF-ASTORIAETTES.

BY JEEMS.

Time flies so fast that it seems but yesterday that the stove manufacturers were bidding farewell to their hospitable Eastern brethren at the famous Squantum Club, singing that grand old battle hymn, "Good-by, Squantum, We Must Leave you," but, presto, here we are again, Mr. Merryman, as the clown says in the circus. "Wait on the lady, and see what she wants," says the ringmaster. "To be sure, the lady wants the banners," she says, "bring forth the banners, boys," and the boys rush on with them, and the show is on in full swing.

* * *

The entertaining of the members was a problem for New Yorkers that took considerable time to solve. A drive around the city and a call on the Mayor, a trip over the new East River Bridge and a visit to the subway, and theater at night were considered. But as it was aptly said, if they got out on the bridge it was doubtful if there was enough high minded ones to stand the trip over, and there was no use of risking the experiment. The drive along the subway was all right, as it was kinder natural for some to get underground, but the fact was brought out that some fool of a workman might touch off a blast just at the most interesting moment, and that would mean a lot of muss of scraping up the pieces of the members and mounting them up in any decent shape, so that their folks would know their own patterns. The theater was abandoned from the fact that the vicinity of all the theaters is so crowded at night that the danger of crossing the street with such a number of unduly excited people might result in injury to some of the automobiles, or perhaps knock cabby from his box or squash a policeman, to say nothing of the danger of the kidnappers who are looking for just such "come ons." So it was resolved to corral the whole bunch in the house at night, and stuff and smoke and amuse them to their limit. In this way they would have all present and accounted for, and if anything happened to any one he could be boxed, tagged and shipped at "owner's risk," with the reasonable clause of dangers of the sea and rail only excepted. This would show the man's family and friends that everything had been done that could be done for the visitor.

You see it is this way: New York has but a few left in the stove business; outside competition is so fierce that had they not stowed away a good lot of "cash" early in the game the Waldorf would not have been possible; as it is, they have got caissons sunk in their cellars where they keep the stuff. "You can have our business, but the good stuff we stowed away, never, except it is in the way of hospitality; the caisson is at your service." So it was resolved that Brother Oscar of the Waldorf staff should do his best for the convention if it busted all the caissons in their cellars, and its needless to say that the banners and the hoops were a big success, especially the hooped up hoops from Cedar Rapids, L. I., which made so many of the younger members blush because—never mind.

* * *

There are and have been differences of opinion regarding the matter of entertainments and much can be said on the subject, but down in the inmost soul of man there is something stirred up by it that more than compensates for the loss of old Mr. Business.

Pop Business is all right; nevertheless he is only human and he must be shaken up now and then. It is not required to neglect the old duffer, but let him keep in line. With these few remarks we will resume the subject.

* * *

It is the testimony of all the globe trotters that there is not a hotel in the world where such a scene of social activity is presented as the Waldorf furnishes on the first floor, and it can be affirmed that the members present enjoyed it immensely. And what is more, many of the regular corridor frequenters were delighted with the good looking and prosperous lot of men who wore the rosette of the association. "Every one looks like a regular captain of industry," said one of the habitues as he passed through the swing doors of the sample room of the Waldorf.

* * *

We are hearing a great deal these times about the "captains of industry" and what they are doing and what they are going to do, but the term is generally applied to a few people only like Boss Morgan, Johnny Rockfellow, Charlie Schwab and a few others who have piled up treasures on earth, in order that we may admire it and learn of them how good and easy it is, and how profitable it is to serve mamon when you go at it in a straight, forward hit out from the shoulder and fight to a finish mode.

* * *

Well! the stove manufacturers have got the same kind of captains of industry who will head and put an army in the field, and before snow flies, that will paralyze the other captains of industry, both in boldness of execution and the grandeur of their plans. As one of them explained in the cafe of the Waldorf, our intention is to benefit every man, woman and child in our business. "We are going to turn over our entire business and property in one grand trust for their entire and exclusive benefit for ten years. Not one dollar on salaries is to be paid to us captains, nor dividends of any kind, except say, 3 per cent. interest on the actual capital, mind you! the actual capital; no water allowed in our deal. We absolutely trustee everything over to them and we propose to work like 'son of a guns' for the benefit of the industry. The only hitch in the whole affair is with the labor unions. They insist that the interest clause shall be stricken out and the matter of future payments left to their discretion; also that no manufacturer or son or relative of one shall be employed in the company in any capacity whatever. This hardly seems fair, but if we cannot get any better 'terms from them we will be obliged to accept, besides—' Just then Oscar came around and sung out, "Hackensack Meadows, all out."

* * *

That famous old subject of prices was thrashed over among many in their heart to heart and hand to mouth interviews in the many nooks and corners of the big inn. Now if all that was said on the subject could have been reported by a yellow journal expert it would have made highly entertaining reading. There were so many massive and well fortified items of how some concerns were cutting the life out of things, "while we, bless our dear hearts, were staggering under our burden and they scooping our customers. Why, look here, gentlemen, as an illustration, we are asking for our Consolation $20; and mind you I want you to understand we are getting it, and if they don't pay it they don't get it, while those fool killers near us are actually selling at last year's prices for future delivery and are getting our customers; don't blame the customers, but we will keep our stoves and melt them up before we will sell them at such prices." Just then a camp follower, who had been in the party, invited the bunch to take a little filtered water with him, and he casually remarked to one of his intimates in the group that he heard what John said, "but I will be durned if I haven't just left old Bill Jones shooting off his mouth about John's people doing exactly the same stroke of business, and said that he would keep his stoves until it froze over before he would do business that way."

* * *

The fact is, these human contradictions "tend to maceration of superficial part of the empidermis of the mind, which becomes excited, and occasions probably too rapid a proliferation of the cells of the Malpighian layer." At least this is the solution of the veteran Henry Cribben, and he comes pretty near knowing of what he is talking about. A good deal pro and con, whatever that means, can be said on this subject.

* * *

The New York manufacturers invited all the members and what came with them, including all the staff of "followers de camp," to a "conflagration," as they facetiously expressed it, to be held on Thursday evening, which was afterward changed to Wednesday evening, but in the anxiety of Oscar's help to run things one of his right hand Chit Muggars from Hindustani, Ireland, constituted himself a committee of one on conflagaration, went up on the next floor, where the properties were stowed for the show, and touched off the stuff on his own account, and the consequence was he iiked to have burned down the whole goll darned tavern. As it was, they turned on so much water to put out the blaze that it ran right down in the meeting room and soaked some of the members. Of course the crowd didn't mind the fire, for they are used to that, but they did object to water, except—after. As a chaser it is ali right, but as a shower bath during business hours it is inconvenient. The Hindustani was asked what business he had to set off the fireworks? "Sure," he replied, "some one sung out let her go Gallagher and sure I did."

* * *

Jake Cantor, president of the Borough of Manhattan, in a neat and brief address invited all the gentlemen to use the town just as though they owned it, because, as Jake put it, old Ben Franklin was a stove man, and as far as he was concerned he went in for cook stoves and for that matter cooks also. If there was anything that brought happiness and contentment it was a good stove. He didn't say if he preferred steel or cast iron make. Jake was all right, but he claimed too much. He said the municipality made the weather to order for them, when the real fact was it was Bill Myers who done it. He had the sky all swept and the sun cleaned off and it was real lovely, as the ladies say.

THE NATIONAL ASSOCIATION NUNC PRO TUNC.

BY JAMES C. BAYLES.

It is the privilege of one who feels himself irresistibly drawn near

> —those iron gates
> Where age upon a mound of ashes waits

to do sundry and various unpleasant things (which, from the viewpoint of the one to whom they are done, are as unnecessary as they are undesirable), to be reminiscent. This has been my mood ever since, at the welcome invitation of my friend Parlin, I became a visitor at the meeing of the National Association of Stove Manufacturers at the Waldorf-Astoria on Wednesday and Thursday last. The interval since the last convention which it was my privilege and pleasure to attend was about 20 years. In itself considered, this fact has no especial significance and can scarcely be expected to possess greater trade interest than might very well have been exhausted in a news item to the following effect:

> At intervals during the meeting a venerable gentleman was observed hovering about the parlor in which the National Association of Stove Manufacturers met, as if looking for some one—a long lost brother, it may be, or perhaps a wayward son. He reminded one who observed him of old John Burns at Gettysburg, who seemed the incarnation of ancient history, and of him, as of Burns, it might be said that
>
> The past of the nation was battling there—
>
> or, at least, was ready to do battle if occasion offered. He was subsequently identified as, &c.

That I had rather write this than have it written of me by some flippant young reporter of 35 or thereabouts goes without saying. In fact, I should not write it of myself if I did not feel quite sure that those for whom the matter has any interest whatever will be apt to say of it, as Mark Twain telegraphed of the premature announcement of his death, "The report is greatly exaggerated." To renew acquaintances of years ago was a delightful experience, and if it gave others half as much pleasure as it gave me—but that is scarcely to be expected.

I attended the meeting with mingled sensations of hope and fear. So long a time had elapsed since I was in some sense the storm center of stove trade agitation, and managed to stir up some sort of disturbance about once a week, that I was warranted in hoping that I was kindly forgotten. The fear which possessed me as I grasped one after another the friendly hands of old associates and companions was that I should find myself even less kindly remembered than I could wish. Those whose reading has tended in the direction in which mine has found congenial pasturage (aber nit) will recall that in due course there succeeded to the double ureas crown of Upper and Lower Egypt a Pharaoh who knew not Joseph; in consequence of which lamentable ignorance on the part of said Pharaoh all that remained for said Joseph was to "go 'way back and sit down."

But to me, as no doubt to the other Joseph, there remains a possession of pleasant memories. At the birth of the association the venerable John S. Perry of Albany was chief obstetrician, but I was his assistant, and had no light share of the labors and anxieties of the occasion. It was, on the whole, a very satisfactory accouchment, and by evening both mother and child were doing as well as could be expected. During its infancy and youth I helped to nurse it into vigorous health, and in connection with its early education I perhaps assumed a function somewhat larger than was necessary or desirable. For this however, I am somewhat less accountable than were the gentlemen who were the first presidents of the association, and who, in the absence of other and sure dependences, were in the habit of corresponding with me for a month or six weeks in advance of each meeting to make certain that I would be there and prepared to make an address or read a paper on some topic of immediate and exigent trade interest. Of these preliminaries the membership knew nothing; and for years it was the customary thing for the president, in concluding his address from the chair, to say (I think I can recall the familiar formula):

"We are fortunate in having with us to-day a gentleman who represents, as editor, the greatest and most influential commercial journals of this country; one whom we hold in high personal esteem and who has done much to secure for this association the recognition to which its importance entitles it, by making its proceedings known to all for whom they have interest. I have great pleasure in introducing to the convention Mr. James C. Bayles, editor of *The Iron Age* and *The Metal Worker*, and as I am sure we shall all be pleased to hear from this gentleman I will ask him to address the convention."

Whereupon the blushing recipient of this unexpected, if not unmerited, compliment would rise with proper and becoming, if quite transient, embarrassment, disclaim any preparation for the task assigned him, and proceed to expound some trade thesis with a fluency of thought and an elegance of diction quite inconsistent with the fiction of spontaneity in the case of one who always did speak extemporaneously to best advantage when he had been given from six days' to six weeks' notice that he would be unexpectedly called upon to say something.

The real work of the early conventions was not reached until the second day. I did not feel that it was any intrusion upon the time of the association to help the president fill out the first day, before the committees had made their reports or a programme of business had been arranged. There was really nothing else to do, and had I failed to respond to the appeals made to me to assist in giving the members something to think about in the opening hours of the session I should have made but a poor return for the many courtesies and compliments of which I was the recipient. To turn back through old files of *The Metal Worker* and read again my essays on the principles of art in stove ornamentation, the meretriciousness of nickel trimmings, the basic principles of design violated in the "pump log" base burner, and all that sort of thing, is great joy. President Perry had the curious and unusual faculty of getting mad by degrees. For weeks after one of these addresses, which unintentionally, but inevitably, tended to discredit the Argand type, of which he was the Prophet and High Priest, he would keelhaul me in sarcastic correspondence, the tone of which warranted the belief that if he had known how to swear he would have found great relief therefrom. But before the next meeting came round he would send an irresistible appeal for my co-operation in making it interesting, and the same little comedy would be enacted over again. One may talk of these things long after without violating any confidences. Few, if any, of the earlier presidents of the association are now living, and a majority of those who were then the promising youngsters of the trade and are now gray bearded veterans probably knew very little of what transpired behind the scenes, but may find my reminiscences amusing. Of the service I rendered to those who sought to build up the association in strength and influence I am frankly proud. My contemporaries, with whom my recollections of the stove trade are inseparably associated, were men who merit, and I doubt not hold, high places in your Parthenon, upon whose walls their names should be writ large in letters of gold, Perry, Rathbone, Ransome, Eddy, Phillips, Littlefield, Magee, Jewett, Hill, Tefft, Bradley, Sheppard, Price, Whitehead and many others of equal worth, if less prominence in stove trade councils, not forgetting dear old Filley, with a grip which could make a graven image curl up like a caterpillar on a hot shovel, but with the heart of a woman—the man who could face without flinching honorable obligations which would have shaken the courage of a millionaire, but who, when he had liquidated his indorsements, like the honest man he was, and was given an expression of the affection and respect of his associates in the loving cup presented to him at the Niagara meeting, collapsed in not unmanly tears and bid me make the response for which he could find no fitting words. None can recall this grizzled old veteran as president without a smile which extends from the facial muscles to the heart strings. I remember at one of the meetings at which he presided, a motion to sustain prices was offered, accompanied by a demand for a rising vote; and when debate was ended and a vote was in order, the president said in all simplicity: "Will the convention please rise?" Filley was no parliamentarian, but he was a good man and none joined more heartily than he in the laughs to which his errors gave rise.

I may also say without violation of confidence that I had much to do with the preparation of the addresses from the chair, which were the platforms of the earlier campaigns of the association. Frankly, I never wrote any of them, but in a good many instances I edited them in manuscript, planted the flowers of rhetoric in their waste places and made sure that there existed between verbs and nouns the agreement for which a prejudice exists among those who affect English grammar. None of these gentlemen were illiterate. They were wise and thoughtful men, clear headed and practical, but not all of them had gained the polish of the drawing room during the years when they were powdered with the facing of the foundry; and to sandpaper and shellac their addresses was a pleasure. In a word, it fell to my lot to be the "literary cuss" of the association, and if my style was not recognized in many and widely diverse contributions to its proceedings during its first ten years of its useful life, it was because I was afraid it might be, and took pains to avoid it. These original leaders of the movement were my friends and contemporaries, and as I recalled them in the company of their successors I was reminded that

> When musing on companions gone,
> We doubly feel ourselves alone.

But if the individual withers the times are more and more. When I took a programme of the order of business for the 1902 meeting and read over the topics for discussion and the names of those, or at least some of those, who were to discuss them, it was like listening to familiar music—each passage suggesting that to follow. If you will pardon the seeming egotism of the assertion, which is not wholly a pleasantry, I venture to say that from what I can remember of what was said and written on these subjects, with one exception, 25 years ago, I could have taken part in their discussion acceptably; and without drawing upon a single fact learned in the interval, could easily have avoided creating a suspicion that my information was not strictly contemporaneous. What percentage should pattern expenses bear to annual sales? Bless you, my dear young friends, your fathers were as near a satisfactory solution of that problem 30 years ago as you are now—nearer, perhaps. Is not co-operation as necessary in one market as in another? It seemed so in 1873, and annually ever since. Cannot some uniform rule of fixing selling prices on different types and grades of stoves be adopted? For useful views on this subject turn back to the transactions of any one of a dozen annual and semiannual meetings between 1877 and 1885. Stove nomenclature! Its literature is likely to be coterminous with the stove trade. To what extent should the manufacturer uphold the dealer in guaranteeing stoves? Is there anything to be said on this subject which has not been said many times?

In its present imminent aspects, consolidation is probably of more interest than ever before. Frankly, however, I doubt if any argument could be found for or against it which was not thrashed out 12 or 13 years ago. Those who attended a meeting held in my room in one of the Detroit hotels some 12 years ago, will recall why a strong national stove trust, with a chain of representative works extending from New England beyond the Mississippi, was not then formed. Had it been it would have now been one of the strongest and most prosperous of American industrials. There were more hard and fast options in bundles on the table at that conference than I imagine have ever since been secured. Hence my confidence that there was not one subject up for consideration at the New York meeting of 1902 which could not have been discussed in the light of ancient history as well as with an intimate knowledge of current events. I do not say this disrespectfully. It only shows that through the ages one unceasing purpose runs, that the natural laws of trade are eternal and that truth is perennial. Each generation has to learn the multiplication table for itself, and what are problems worn to rags for the passing generation of stove manufacturers are new and exciting problems for the young men who have their wisdom to gain in the school of experience.

But to listen to these castanean questions, and to hear obvious propositions debated in all seriousness, made me restless, and for the first time in a good while I was sorry to find myself merely an onlooker. Perhaps my feelings can best be expressed by recalling a pleasing and instructive incident which happened on a Southern railroad during one of my trips through that section. The train had been bumping along at its usual perilous speed of 11 miles an hour, and the passengers, tired, dirty and hungry, organized a syndicate to curse the president, the directors, the superintendent, the general passenger agent and so on down to the rear brakeman, and derived much satisfaction therefrom. It was noticed, however, that one passenger held his peace. His reticence disturbed the harmony of the concert of blasphemy, and at last it was decided to appoint a committee to wait upon the reticent passenger and demand the reason for his silence. "Well, gentlemen," replied the stranger, "I would exceedingly like to join you, as my sympathies are wholly with you; but really, in view of the fact that I'm traveling on a pass, it would not be quite delicate to say what I think, notwithstanding the fact that I have a vocabulary of my own, which would be useful at the moment. However, if this sort of thing keeps up much longer, I'm —— if I don't get off at the next station and buy a ticket, just for the pleasure of joining you all."

Nunc pro tunc? Oh, yes. I supposed you knew what that signified. Well, it is a phrase in law Latin, meaning literally *now for then*, and is applied to proceedings brought or an action performed at a date subsequent to the assumed date—the assumption being a legal fiction, of which there are many. Under the pretext of the annual meeting of 1902 I have discussed, *nunc pro tunc*, the meetings previous to 1882. This may not be good journalism from a newspaper point of view, but it is no end of good fun; and, after all, of what use are memories if one cannot use them for his own pleasure?

◆

Lyman S. Baker, Camden, Mich., manufacturer of the Economy Furnace, informs us that he has a new catalogue in preparation and will be glad to furnish copies to those in the Furnace trade who apply for them.

THE STOVE FOUNDERS' NATIONAL DEFENSE ASSOCIATION.

In accordance with time honored custom, the Stove Founders' National Defense Association held their annual meeting on the day preceding the gathering of the National Association of Stove Manufacturers. It was the seventeenth annual convention. The meeting occupied the whole of Tuesday, and is stated to have been one of the most interesting in the experience of the organization. The attendance was the largest in the history of the association, numbering about 60. The number present was, in fact, greater than the number of establishments embraced in the membership, several companies having more than one representative present.

President Chauncey H. Castle of Quincy, Ill., presented his annual report, in which he reviewed the events of the year, going into the history of such labor troubles as had occurred with the necessary detail to enable those present to understand what had been accomplished. Happily, these troubles had not been of great importance. The annual meeting is the only occasion upon which the members are fully advised as to matters of this character, as for obvious reasons the information regarding these delicate questions is not widely disseminated. As this organization deals with matters pertaining to labor only, acting in the capacity of a committee of inquiry, conciliation and adjustment, whenever called upon to do so by any of its members, or by any organization of workmen with whom it may have agreements, its work is necessarily individual and, therefore, personal and confidential.

The president's report of work of this character accomplished during the year just past covered 33 large pages of close typewriting and referred to nearly 100 "issues" that had been brought up for attention, all of which were adjusted without serious trouble or expense or are now in process of adjustment. Referring to the general condition of the affairs of the association, Mr. Castle says:

"The membership has largely increased; its financial condition is shown to be entirely satisfactory; thorough harmony prevails among its members, and its plan of procedure has been demonstrated to be advantageous and satisfactory to employees as well as to employers, so that workmen in departments of the stove manufacturing business, other than with whom they have agreements for conciliation, are now asking for such, to the end that the agreed-upon plans of adjustment may be applied."

The death of George H. Holland of St. Louis during the year left a vacancy on one of the district committees, which President Castle filled at the time by the appointment of Ralph S. Buck, also of St. Louis. Mr. Buck's appointment was ratified by the association, who elected him to serve for the ensuing year. The district committees were enlarged by the addition of Stanhope Boal of Piqua, Ohio, and Samuel R. Baldwin of Pittsburgh, Pa.

The association added nine to its list of members during the year. That the affairs of the association are running along very satisfactorily may be inferred from the fact that the old officers were re-elected and a hearty vote of thanks was given them for their efficient services. The list of officers stands as follows:

President, Chauncey H. Castle, Quincy, Ill.

Vice-President, Henry Cribben, Chicago.

Treasurer, Abram C. Mott, Philadelphia.

Secretary, Thomas J. Hogan, Chicago.

General Executive Committee: Chauncey H. Castle, Quincy, Ill.; Jeremiah Dwyer, Detroit, Mich.; Henry Cribben, Chicago; Abram C. Mott, Philadelphia; Grange Sard, Albany, N. Y.; N. H. Burt, Leavenworth, Kan.; Lazard Kahn, Hamilton, O.; John A. Roe, Pittsburgh, Pa., and D. McAfee, Quincy, Ill.

THE PITTSBURGH STOVE & RANGE COMPANY of Pittsburgh, Pa., have recently increased their already large force of salesmen by entering into contracts with George J. Buchanan, who will sell the Good Luck line in Illinois and a portion of Indiana; Z. W. Morris, who will represent them in Northern Texas, Missouri and Oklahoma, and Thomas R. Boss, who will present the merits of their extensive line of Stoves, Ranges and Hot Air Furnaces for the consideration of the Stove dealers in Iowa.

The New York Office of the Utica Heater Company.

For the purpose of better serving their customers in New York City and vicinity the Utica Heater Company of Utica, N. Y., have opened an office and salesroom at 106 and 108 Beekman street. During the past month this four-story building has been thoroughly overhauled and splendidly arranged for facilitating the sale of the goods manufactured by the company. On the first floor will be displayed the popular line of Superior heaters, also the Imperial vertical sectional and the Auburn round steam and hot water boilers. These goods will be so arranged on the sample floor that their construction and operation may be readily understood by prospective purchasers. The Robert Campbell Heating Company, heating engineers and contractors, have offices on the sample floor and will make a specialty of these goods in their contract work in the vicinity of New York. William Kerby, who also has offices on the first floor, will look after the requirements of the trade in the hot air furnace line. The third and fourth floors have been arranged as workshops, while the basement and other floors will be utilized for carrying a stock of goods for prompt shipment and quick delivery in the vicinity of New York.

The necessity for this enterprise will be recognized when it is known that the Superior furnaces and Utica heaters now comprise seven distinct types and designs, with a large number of sizes running from heaters with 28-inch casings and 18-inch fire pots to 62-inch casings with 34-inch fire pots. These heaters are mounted either in steel plate or cast iron and are adapted either for brick setting or portable casing. The construction adapts this line to meet all climatic or fuel conditions. The Imperial vertical sectional steam and hot water heaters are made with several widths of grate and an indirect flue and are adapted for large and small work. The Auburn boiler, which is well known to the trade, is made either as a magazine boiler or as a surface burner, and being offered in a number of sizes is adapted for a variety of buildings. The company present this as a very complete line of heating apparatus, especially adapted to the requirements of the Eastern trade. Heating contractors are invited to call at the new salesroom and make a personal inspection of the company's new goods. W. H. Switzer, vice-president of the company, has been in New York City during the past week rendering his assistance in the arrangement of the samples and the utilizing of the space in this new emporium of heating goods.

Syracuse Heater Catalogue.

The catalogue of the Syracuse heater patented by C. B. Howard and manufactured by the Syracuse Heater Company of Syracuse, N. Y., has just been issued. It consists of 24 pages bound in a blue cover, and printed in two colors. The heater is rectangular in form, designed to use a galvanized iron casing. It consists of a cast iron chamber which incloses a fire box and ash pit section. This chamber is rectangular in plan, while the cross section is of oval form. It is corrugated both for the purpose of giving strength and to present a large expanse of hot surface with which the air must come in contact in passing through the heater. The upper portion of this cast iron corrugated shell is exposed to the direct rays of the fire, while the products of combustion rise and play against it before they go down under the ash pit and travel to the final smoke outlet, the construction providing for both a direct and indirect draft. These heaters are made in a variety of sizes. During the past winter they have been tested in several States, and testimonial letters are presented which show the satisfactory results obtained.

The Coleized Steel Hot Blast Range.

The Cole Mfg. Company of Chicago will shortly bring out a new range which they will name the Coleized Steel hot blast range. The company claim that this range has a greater number of novel features in its construction than any cooking device put on the market during the last 15 years. One of the most important of these new ideas is the use of a newly invented metal, in the place of gray cast iron, in the fire box linings and other parts which are subjected to great heat. This new metal is named "Coleized Steel," and consists of a special mixture prepared according to a secret formula perfected by President E. C. Cole of this company. This metal has been subjected to a series of tests in comparison with standard gray iron castings and malleable iron castings. The belief is generally entertained that malleable castings are more likely to warp when subjected to great heat than gray iron castings. In the course of his experiments Mr. Cole ascertained that if malleable castings were made of the same weight as gray iron castings their heat resistance would be considerably greater. The result of his comparative tests is herewith illustrated. A gray iron casting in the form of a grate bar, after having been subjected nine days to a furnace test, was found to have retained not over one-third of its sectional area as a solid casting, whereas the Coleized Steel cast in the same form precisely and subjected to the same test was found in perfect condition and of such strength that it could hardly be broken when hammered on an anvil. A gray iron casting, heated slightly beyond red heat, was easily shattered when struck on the anvil, while the Coleized Steel acts more like wrought iron when subjected to such a test, being very tough. The Coleized Steel, according to the experiments made, is found to have four times greater heat resistance than standard gray iron castings and two times greater heat resistance than malleable iron. These experiments are especially interesting, as it is believed that nothing has been attempted in the past in making special mixtures of heat resisting quality, although a great deal has been done in making castings to secure strength and toughness, such as desired for car wheels and other purposes involving severe service.

Comparison of Coleized Steel with Malleable and Gray Iron Castings.

Another special feature of this range will be a grill, 7 x 14 inches, enabling the housewife to broil and toast with the commonest soft coal equal to any such work that can be done over a charcoal broiler. This feature, as it does not interfere with other cooking, will add nearly 25 per cent. to the capacity of the range. Another point is doing away with the end wood feed door, which is so seldom used that it is practically a useless attachment to ranges. Another new idea is the method of heating water, both in the reservoir and the water back, the water back being entirely separate from the fire box, utilizing the waste heat for this purpose so as to be of value in cooking or baking. Altogether there are over 23 distinct novel features of construction in this range, and the manufacturers predict for it as great a success as has been achieved by their hot blast and air tight heaters. They are very confident that the use of Coleized Steel will accomplish a revolution in stove construction.

The company have acquired a high reputation as originators of stove specialties. If their new range proves to be the great success which they expect, they will add still more to their reputation. The new range will be thoroughly tested in every respect before it is offered to the trade. The company have patented the name "Coleized Steel" as their trade-mark.

The Charter Oak Stove & Range Company of St. Louis, Mo., have completed arrangements for the transformation of their lighting and power plant. The new plant will consist of a 160 horse-power Ideal engine directly connected to a 100 kw. Triumph generator. This system will furnish light and power for the company's entire plant. Six motors for the different departments are also being supplied by the Triumph Electrical Company. The lamp requirements of 18 inclosed arc lamps for the foundry and 427 16-candle power incandescent lamps for the other departments will shortly be contracted for. This new power plant is made necessary by the large extension to the company's business. It will give the Charter Oak Stove & Range Company one of the most up to date lighting and power plants possessed by any large concern in the country. The old engines will be retained for use in emergencies.

The H. Wetter Mfg. Company's New Plant.

On January 19 last the stove plant of the H. Wetter Mfg. Company, at Memphis, Tenn., was destroyed by fire, and exactly three months from that date, on April 19, the company so managed as to be able to start up the new plant. Without any loss of time after the fire the management at once began to make a careful investigation of different locations in the United States, and many cities and towns offered tempting inducements in order to secure the location of the industry. After careful consideration it was determined that no place in the country presented as favorable advantages as did South Pittsburg, Tenn., situated in the heart of some of the largest iron and coal fields in the world. Through their agents the company purchased the plant at that place, which was built several years ago, during the "boom" times, at a cost of $250,000. Being complete in all its details, but a short time was required in getting it into running order. The property extends over an area of 10 acres, and the plant consists of five modern buildings, two being three-story structures, 60 x 250 feet, and a three-story building, 50 x 150 feet, and two one-story buildings of 200 x 200 feet and 60 x 60 feet, respectively.

The general offices and warehouse of the concern will be located in Memphis, and they will have a Western distributing house at St. Joseph, Mo. The company have a fine catalogue now in the hands of the printers, which will be mailed shortly to the trade. Their traveling representatives are now starting out on their regular trips taking orders for the Superb line of stoves and ranges for summer and fall delivery. The largest pattern making concerns in the country have been pushed to turn out new patterns for the concern, which will be modern and up to date in every respect. A general view of the company's new plant is given in another part of this issue.

◆

UTILIZING WASTE HEAT.

BY INGENUITY.

Some of the readers of *The Metal Worker* may be interested in a method of utilizing heat that would otherwise go to waste that I have introduced into the house in which I live. In my section of the country a large number of people live in what are termed two-family houses—that is, houses containing complete sets of apartments, on the first and second floors, entirely separate and distinct from each other. This house was built by me and I appreciated the fact that unless I utilized the heat that went to waste from the cook stove of my tenant on the first floor, no benefit would be derived from it. When the house was erected I provided 8 x 8 inch flues for the kitchen in both sets of apartments. From the pipe hole in the kitchen stove on the first floor I ran clear up to the top of the chimney a heavy 6-inch smoke pipe, and just above the baseboard in the dining room of the apartment on the second floor I placed an 8 x 12 inch hot air register, while, just over the top of this register, I completely shut off the flue. I then arranged for air to enter the base of the brick flue so that it could pass up around the hot smoke pipe and flow out into my dining room. The result has been that my dining room has been kept comfortably warm without any expenditure for fuel on my part, and as far as I can learn, without any disadvantage to my tenant on the first floor.

◆

The Quincy Foundry & Novelty Company, Quincy, Ill., are pushing with a great deal of enterprise the merits of their Noxall Steel Cook Stove, which is intended for burning coal or wood as a fuel. The body is made of heavy polished blue steel, lined throughout with asbestos millboard, and the Stove has large pouch feed for coal, square oven finished in aluminum, cast flue back and flue strips, spring balanced oven door, extension fire box for wood and large scoop ash pan. It is made in several styles and sizes, some of which are illustrated in the catalogue which the company have issued. They also call attention to their Air Tight Heaters for wood, of which they make 65 styles and sizes. Some interesting references to these goods will be found in the company's announcement presented this week in another part of this issue.

◆

AIR STILL "IN ROTATION."

Notwithstanding the fact that in previous articles about furnace work we have expressed a desire to present practical information rather than critical contributions, there has been a manifest tendency with some of our contributors to controversy over opinions rather than to the presentation of experiences. We are still strongly of the opinion that if the same energy that is devoted to criticism and controversy was expended in encouragement and explanation, greater benefit would be derived by the furnace trade. We therefore take this opportunity to again point out some facts in reference to heating systems.

In the first place, so far as large buildings are concerned, a well organized effort is being made in several different States to secure the enactment of laws which will make compulsory the ventilation of schools, churches and other public buildings. This is a recognition of the need of a large quantity of fresh air wherever a considerable number of people are gathered together. Those who are opposed to the "rotary system" of heating may seize upon these facts as a justification of their views. They must not lose sight, however, of the use of the mixing damper in many such heating systems, which, in many instances, is so arranged that the air from out of doors may be shut off, and the air in the building kept in circulation previous to the assembling of the audience. This is common practice with the most advanced engineers, where the conditions will permit the justification of this practice, in view of the fact that by this method a building can be heated to the required temperature with a much less expenditure of fuel than if all the air was taken from out of doors.

So far as the heating of residences is concerned, where the doors are open through the building, as is quite frequently the case, there is a very large volume of air in proportion to the occupants of the building, and a sufficient change to maintain a satisfactory atmosphere is held to be effected by the leakage around doors and windows and through the opening and closing of doors. Many who install the rotary system of furnace heating make provision to take the air from out of doors in the early fall and late spring, and only use the rotary system alone in extremely cold weather.

In view of these facts, some of the harsh criticisms which have been received have been softened before presentation to our readers. We hope that those who entertain different ideas from those expressed by our contributors will in future, instead of broadly condemning what they disagree with, explain in detail the basis on which their views rest, and that the controversial feature will be eliminated so far as possible from future discussions. This, we think, would be for the best interests of the whole trade.

In view of what has been said by previous contributors, we are constrained to afford "F. B. K." an opportunity to reply to some of the criticisms presented in *The Metal Worker* of April 26, on his article which appeared in *The Metal Worker* of April 5. He writes as follows:

> It appears that your correspondent from Minneapolis is going for me rough shod. I am always looking for improvement, but it seems that my friend in Minneapolis can say a great deal without giving much that is of benefit to the whole trade. I would ask why he did not give us something better if a rotary system is so bad. He quotes a system which I believe has been quite widely condemned, and now is very much modified when used. I would ask, however, where would you find a man that would pay what it costs to install such a system in a residence? I am of the opinion that he cannot be found in Ohio. I was not interested in the heating of public buildings, but was content to get information on heating residences, and I have never seen a residence where there was much objection raised to too much heat, for it is too frequently too cold in many dwelling houses. It is no trouble to get cold, fresh air when it is outside, considering the way houses are built in these days. The trouble is to hold enough warm air in the houses to keep them at a comfortable temperature.

This is largely due to an attitude of mind, on the part of the buyer, which it is difficult to control. He gets bids from everybody and accepts the lowest bid, regardless of whether the contractor has the necessary knowledge and ability, and can be relied on to furnish the material that will be required to properly heat the house.

I have just examined a furnace job where outside fresh air was used at first, but as the heating was unsatisfactory, an inside air pipe was taken from the hall. Yet it is not satisfactory, although double the amount of fuel is consumed that should be. The trouble with this job is the same as with many others that are put in by the cheapest man. The hot air pipes have an area of 475 square inches, and a 16-inch round pipe supplies the air from out of doors. This has an area of 201 square inches, while an 18-inch pipe is taken from the hall, which has an area of 254 square inches. It is no wonder that an air supply of 254 square inches will not fill hot air pipes having an area of 475 square inches, and that the windward side of the building is always difficult to heat. This is not the fault of either the outside air supply or the rotary system, but purely of the man who installed the plant. I think that if any one ought to be "caged," it is the man who is always hunting for a contractor who will do the job the cheapest, regardless of his ability to do a good job.

"Iowa" spoke about absorbing a barrel of water. I would ask him to make a sketch showing how he connects his water heater, also how he connects his cold air pipes. I would also like to see a complete plan of just how he installs a system in a residence. I use no water on any of my jobs unless my customer wants it. I have put in a number of rotary furnace systems and they gave good satisfaction. One of these is in a building erected by J. D. Van Deman, and occupied by Prof. W. E. Smyser, an Akron air blast furnace being used. This job has been so satisfactory that a similar furnace installed in the same way has been used in eight other buildings erected by the same owner, who once lived in a house having a furnace to which all the air supplied was taken from the outside. This man is a prominent lawyer, and, after living in one of the houses heated by me, he is not of the opinion that I should be "caged," but has expressed himself as having a disposition to sue the party for damages who installed his first heating system. I extend my respects to the Minneapolis correspondent, and assure him that Ohio is still a good State. I hope that I have not stepped too hard on anybody's corns, and trust that "Iowa," or some other furnaceman, will give us some of the kind of information that I should like to have.

Calculations for Furnaces Using Gas Fuel.

Our furnace readers will be interested in the following information presented by the Springfield Furnace Company of Springfield, Ohio, in reference to the Thompson gas furnace, manufactured by them, which is entirely different in construction from the plans followed in the manufacture of coal furnaces. This furnace has the heating surfaces increased in extent by many subdivisions in the combustion chamber and flues. The information given by the company is as follows:

Our furnaces are so radically different in construction from coal furnaces that we can, of course, give no dimensions of grate surface or of coal burned. In figuring out what will be required of one of our heaters, we pay no attention whatever to the matter of cubic feet of space heated, having reached the conclusion that this is a totally unreliable basis for calculating the amount of heating required. Our plan, and it is one that has worked out well when backed up by a reasonable degree of judgment in fitting up a furnace, has been to take the entire outside area of the building, including both sides and both ends and the entire roof area, and add these together to get the exposed surfaces in square feet. We divide this amount by ten, and get the total number of square inches of area required in the hot air pipes. But we find that even this rule cannot be depended on as a rule, because judgment has to be used in the matter of sizes of pipes according to their length and the number of bends in them. An 8-inch pipe extending perpendicularly up from the top of a furnace casing to a register will carry more hot air than a 12-inch pipe which is carried nearly horizontal for 20 or 30 feet.

With our furnace we have cut out entirely the use of the cold air duct, excepting where there is a cold air room in the cellar, and the duct is needed for that room. Our rule is that the cold air supply must exceed by 10 per cent. the total area of all the hot air pipes connected with the furnace. This practice has worked out very successfully with our furnace; but, as before stated, our furnace is constructed all through on such a radically different plan from any other furnace that we do not consider that rules which work well for us will be a success with others.

ODD PLATES

The Century Stove & Mfg. Company of Johnstown, Pa., with a capital of $100,000, were recently incorporated with the following directors: Rowland S. Wilson and Robert Monro of Pittsburgh and Edward C. Warren, John H. Waters and Samuel B. Waters of Johnstown.

The Fischer-Leaf Company, with office and foundry at Sixteenth and High streets, Louisville, Ky., have issued a folder calling attention to the Modern Arizona and Glen Arizona Square Oven Cook Stoves, which they have recently added to their extensive assortment of specialties. These constructions are of an attractive exterior and, the manufacturers say, possess features which distinguish them from the ordinary square oven Cook Stoves. Another specialty, to which the company invite attention by means of an eight-page pamphlet, is the Arizona Down Draft Heater, offered in radiator and oak styles. These heaters are handsomely ornamented, nickel playing a prominent part in the external decoration. They are intended for using hard coal, soft coal, slack or coke and embody the latest features.

The Essex Gas Stove Company, with office at 164 Market street, Newark, N. J., have recently been incorporated with a capital stock of $50,000. The incorporators are Samuel Stewart, S. W. Westervelt and Walter P. Lindsley.

The Wheeling Gas Stove & Range Company, who started on a small scale in Moundsville, W. Va., have decided to remove their plant to Wheeling, where operations will be conducted more extensively. A force of several hundred men will be employed and the plant will be thoroughly equipped with modern machinery.

The enameling department of the Thomas, Roberts, Stevenson Company, manufacturers of Stoves, Ranges and Heaters, Philadelphia, Pa., was badly damaged on the 12th inst. by an explosion, the cause of which is unknown. Two men were seriously injured, but the resulting fire was quickly extinguished without extensive loss.

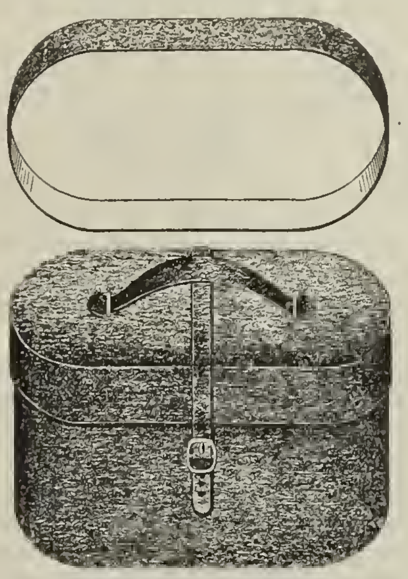
Floyd, Wells & Co., Royersford, Pa., are making several improvements to their plant to enable them to take better care of their growing business, among the most important being an addition to their pattern shop, for which a new two-story brick building, 30 x 45 feet, is being erected. Business conditions with them are reported to be in a very good condition, and the indications favorable for a record breaking season.

The Moncrief Furnace & Foundry Company, Atlanta, Ga., successors to the Moncrief Furnace Company, have recently enlarged their foundry and materially increased their productive capacity. The company not only are in a position to manufacture their Heaters in larger numbers, but also have facilities for making Brass, Hardware, and Machinery Castings. They are now installing a heating plant and closets in Berkeley, Va., also a heating plant on the mechanical system in the Second Presbyterian Church, Norfolk, Va. In addition they have several smaller contracts for points in the State of Texas.

The Standard Blue Flame Oil Gas Company have been incorporated under the laws of Delaware with a capital stock of $500,000. The Board of Directors will organize by electing officers in the near future, but a contract has been closed to build a new factory for the manufacture of Wickless Blue Flame Oil Gas Generators, as well as Steel Ranges, Stoves, &c., at Kankakee, Ill. Three buildings will be put up; one 50 x 200 feet, one 30 x 60 feet and a power house 40 x 50 feet, all to be constructed of brick and stone. Other buildings will be added as is demanded by the growth of the enterprise. The company expect to employ from 100 to 300 men during the first two years. Information comes from Kankakee that in consideration of the location of the factory at that place, the company are to receive a 5-acre site, 35 lots, and $5000 cash. The present office and factory of the company are at 58 West Randolph street, Chicago, and it seems probable that the salesrooms will remain at that point.

The Twentieth Century Ventilated Lunch Box.

The accompanying cut represents a ventilated lunch box, put on the market by the Reading Saddle & Mfg. Company, Reading Pa. The interior of the cover is shown above the lunch box, the two small circles indicating the location of the ventilators. The manufacturers state that the material used in the construction of the boxes is the best from a sanitary point of view. and that the protected ventilators in the lid cause perfect circulation of air. The boxes are made in three size, as follows: 8¼ x 4¼ x 4¾; 9¾ x 4⅝ x 5½, and 11¼ x 5¼ x 6.



The Twentieth Century Ventilated Lunch Box.

The following advantages are claimed by the makers over square cornered boxes: That the round ends prevent dirt lodging in corners, and allow the box to be thoroughly cleansed by lightly rubbing with a damp cloth or sponge; that there are no square corners to catch in clothing and therefore no scuffing as on square cornered boxes; that the water proof lining and special covering prevent grease showing on the outside, and that the shape of the box with rigid top and bottom causes it to be firm and to wear longer.

Ironsides Improved Tormay Oiler.

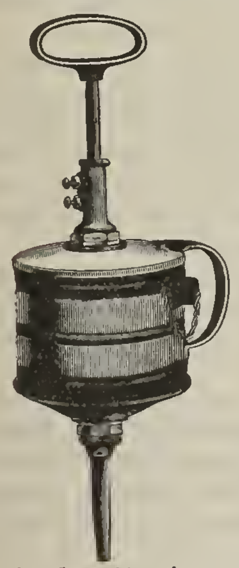


Fig. 1.—Ironsides Improved Tormay Oiler, ¾ Gallon Capacity.

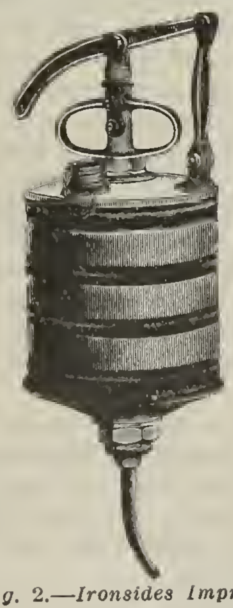

Fig. 2.—Ironsides Improved Tormay Oiler, 1½ Gallons Capacity.

The Ironsides Company, Columbus, Ohio, are manufacturing the Ironsides improved Tormay oiler. The device, which is herewith illustrated in two different forms for economically applying oil to working parts, is reputed to have had its origin in an operating department of pronounced wastefulness, and originally provided for the oiling of mine car wheels, but that its accredited benefits duly adapted it to the operating departments of the various classes of mining and other machinery and general manufacturing institutions wherever lubricants are required. A saving of as great as 50 per cent. in both labor and also oil is alleged to have followed its adoption in some of the larger coal mining properties. Not unlike other innovations, the earlier productions are said to have proven deficient in construction. In the oiler as now offered former inherent weaknesses have been eliminated and suggested improvements from the more experienced users incorporated, and it is described as an article of superior design, workmanship and great durability. The oiler consists of a central working barrel, containing a plunger and surrounded by an oil reservoir. Openings in the working barrel, sealed or unsealed, according to position of plunger, communicate with the oil reservoir. The adjustability of the stroke of plunger governs the quantity of oil forced at each operation. When not in use its contents are not only preserved from leakage, but also protected from dust and other impurities.

Oplex Coffee Mill

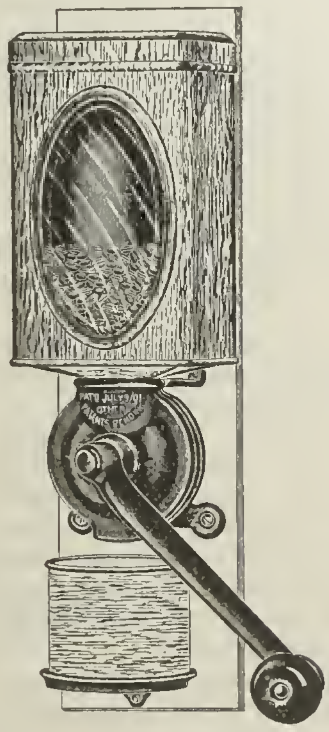

Fig. 1.—Oplex Double Grinder Mill and Canister.

Bronson-Walton Company, 1800 East Madison avenue, Cleveland, Ohio, for whom John H. Graham & Co., 113 Chambers street, New York, are direct representatives, are now introducing their Oplex coffee mill, as here illustrated. This is a square canister of sheet steel, lacquered inside to prevent rust and lithographed outside in antique oak design. The heavy oval glass is pressed into the front and held there by a steel band. The canister holds one pound of whole coffee practically air tight, and the contents are visible through the glass. A strong iron bracket holds the cup for receiving ground coffee. The cup is tin, lithographed outside to match the canister. The grinding parts, shown in Fig. 2, are machine finished so that they turn easily and smoothly, and the grinding nuts can be adjusted so as to grind from coarse to very fine. In operation the bean descends from the canister over the front grinder C and the rear grinder F and drops when ground into the cup below. Adjustment for the grade of coffee desired is obtained by turning the thumb screw at the back. By means of the double grinder the grinding capacity is increased two fold. The mill is varnished oak pattern and each one is packed in a carton.

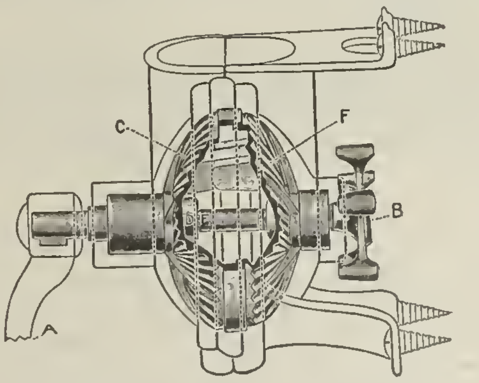

Fig. 2.—Sectional View of Double Grinder.

Stove and Hardware Dealers.

A. B. Neyhart, wholesaler and retailer of Shelf and Heavy Hardware and Stoves, Williamsport, Pa., is putting in a new plate glass front, and also building an addition, 19 x 61 feet.

L. C. Fisher and Geo. E. Smith have formed a partnership at Sprague, Wash., in the Hardware (Shelf and Heavy), Stove, Agricultural Implement, Harness, Vehicle and Sporting Goods business. The style of the concern is L. C. Fisher & Co. They have built a new store with 80 feet front.

Wm. Potts has sold his retail Shelf and Heavy Hardware, Stove, Tinware and Sporting Goods business in Salisbury, Mo., to Hunker Hardware Company, who will continue at the old stand. The company would be glad to receive catalogues, price-lists, &c., relating to the above lines.

W. W. Yokom has been succeeded by Yokom Bros. in the Stove, Tinware and Farm Machinery business in New Hartford, Iowa. The new firm are considering the advisability of entering the Pump, Bicycle and general repair business and would be pleased to have printed matter pertaining to it.

Fred. H. Taylor is successor to Taylor & Taylor in the Shelf Hardware, Stove and Plumbing business in Indianola, Iowa.

Ross Bros. have succeeded William Ross in the Hardware, Stove and Agricultural Implement business in Alden, Kan.

G. E. Snyder, Mt. Ayr, Iowa, has admitted a partner in his retail Hardware, Stove and Grocery business, and the style is now Snyder & Campbell.

Oklahoma Hardware Company, Oklahoma City, O. T., have been incorporated with a capital stock of $100,000. They will do an exclusively wholesale business in Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, &c. They are now erecting a modern warehouse, 75 x 200 feet, with a private railroad switch 200 feet long. They expect to have the warehouse completed before the end of May.

Reineke & White have succeeded Henry Reineke in the Hardware, Stove, Farm Implement and Sporting Goods business in Henryetta, I. T. The firm have doubled the amount of stock formerly carried and report a very satisfactory trade, as the new country is fast opening up.

Petersen & Schoening Company, Council Bluffs, Iowa, have been incorporated with a capital stock of $40,000, succeeding Petersen & Schoening in the wholesale and retail Hardware, Stove, Sporting Goods and Furniture business.

C. G. Dahlstrem & Son, Ceresco, Neb., are putting up a new brick building, 24 x 50 feet, two stories high, which they will occupy with their stock of Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c.

The F. W. Brosig Hardware Company, Navasota, Texas, have succeeded F. W. Brosig and E. L. & C. C. Ahrenbeck. The capital stock of the new company is $50,000, the following being the officers: E. L. Ahrenbeck, president; J. W. Brosig, vice-president, and R. C. Terrell, secretary and treasurer. The company will carry on a wholesale and retail business in Shelf and Heavy Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, Buggies, &c.

Chapman & Hills, Lorain, Ohio, have been succeeded by City Hardware Company, who have been incorporated with a capital stock of $20,000. They are dealers in Shelf Hardware, Stoves, Tinware, Farm Implements and Sporting Goods, also slating and sheet metal work, plumbing, heating, &c.

The Lisk Mfg. Company, Canandaigua, N. Y., have favored us with one of their new catalogues, covering their line of Enameled Steel Ware.

The plant of the White Mountain Freezer Company, Manchester, N. H., is being run night and day to keep abreast with the demand for the company's goods.

F. H. Loss, dealer in House Furnishing Specialties, has removed to new quarters at 43 Murray street, New York.

The Detroit Churn & Separator Company have begun the manufacture of their Combined Churn and Cream Separator at Grand River and McGraw street, Detroit, and are now turning out 40 machines a day. S. M. Shotwell is secretary of the company.

G. R. Westlake has purchased a Hardware business in Titonka, Iowa, and will increase the stock thus acquired. Mr. Westlake's line embraces Shelf and Heavy Hardware, Stoves and Tinware, Sporting Goods, Harness, &c.

The Kees Hardware Company, Beatrice, Neb., have been incorporated with a capital stock of $10,000 and the following officers: F. D. Kees, president; J. A. Kees, vice-president; F. E. Kees, treasurer and manager, and Robert B. Smith, secretary. They are successors to the business of F. D. Kees, who by this change in the conduct of the business will hereafter be able to devote more time to his manufacturing interests. The company carry both Shelf and Heavy Hardware, Stoves, Tinware and Sporting Goods.

E. J. Fuller, dealer in Hardware, Stoves, Agricultural Implements, Sporting Goods, &c., Kendall, N. Y., has lately moved into a new store.

Pasadena Hardware Company, Pasadena, Cal., have been incorporated with a capital stock of $20,000 and the following officers: Joseph Welsh, president; R. S. Roberts, vice-president, and W. S. Windham, secretary and treasurer. The company handle Builders' and House Furnishing Hardware, Stoves, Agricultural Implements, Chimney and Sewer Pipe and Plumbers' Supplies.

Haggard & Son have lately commenced business at Sarcoxie, Mo., as dealers in Shelf and Heavy Hardware, Tinware, Sporting Goods and Mining and Blacksmiths' Supplies.

Barr & Keshler have disposed of their Hardware, Stove and Sporting Goods business in Pleasanton, Iowa, to A. M. Haag.

Lester Bros. have succeeded M. Lester in the retail Hardware, Stove, Seed and Grocery business in Hale, Mo.

Chas. M. Witter has succeeded Witter Bros. at Guthrie, O. Mr. Witter carries a general line of Hardware in connection with Harness, Tinware, Dry Goods, Groceries, &c.

R. Scott, dealer in Hardware, Stoves and Factory Supplies, Muncie, Ind., has just taken possession of a new building, by which his facilities for carrying on business have been materially improved. The building is 30 x 110 feet and has two stories and basement.

Gray & Mudgett are a new firm in the Hardware, Farm Implement and Plumbing and Tin business at Essex Junction, Vt. The firm are composed of H. N. Gray of Cambridge, Vt., who has been in the Hardware business at that point for the past 20 years, and R. O. Mudgett, who has been Mr. Gray's head clerk for 12 years. Mr. Mudgett will manage the store.

W. D. Post has sold his Hardware, Stove, Farm Implement and Sporting Goods business in Slaterville Springs, N. Y., to W. A. Ferguson, who will continue at the old stand.

O. D. Sykes, who has been in the retail Stove, Tinware and plumbing business at Seymour, Conn., for the past 20 years, has sold out his business to William J. Culverwell and Luke Burns, who have been in his employ for some time, and both of whom are experienced in the business.

◆

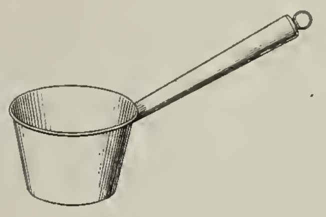
The fire loss of the United States and Canada for the month of April, according to the reports of the New York *Journal of Commerce*, amounted to $13,894,000, as compared with $12,056,000 in the preceding month, and $11,352,000 in April, 1901. The total loss for the first four months of the present year is $61,994,000, being $5,000,000 increase over the figures for the corresponding period of last year and $4,500,000 less than the first four months of 1900.

PATTERN FOR DIPPER WITH HANDLE

(Without Allowance for Laps.)

A dipper with handle, such as is illustrated in Fig. 1, can be made of tin, copper or galvanized iron, according to the use for which it is intended. The method of obtaining the patterns for such a dipper is shown in Fig. 2.

First draw any vertical line, as A B, upon which place the hight of the dipper, as shown by C D. At right angles to C D draw C E and C F, representing the top diameter, and D H and D G, representing the bottom diameter. Connect E and H and extend the line until it intersects the center line at I. Now, using C as center and C E as radius, describe the semicircle or half plan, which divide into equal spaces, as shown by the small figures 1 to 7. Then, with I as center and radii equal to I E and I H, describe the arcs E J and H K. Now, starting at the point E or 7, step off twice the amount of the spaces contained in the half plan, as shown by the small figures 7 to 1 to 7 on E J. From J draw a line to I intersecting the arc H K at K. Then will E H K J be the pattern for the dipper in one piece, to which allowance must be given for seaming and wiring. If the pattern is desired in two pieces, then from 1 draw a line to the center I, intersecting the arc H K at L.



Pattern for Dipper with Handle.—Fig. 1.—Perspective View of Dipper.

M, in Fig. 2, shows the handle, with button and ring N. For the pattern for the handle proceed as is shown in diagram S, in which the handle is shown slightly enlarged by O P. Draw the center line of the handle 3 3′, extending it indefinitely toward R in its relative position to the side of the dipper, 1′ T. At right angles to R 3 draw the line 1 5 at its proper distance from 1′, which will represent the diameter of the handle at the top. From the points 1 and 5 draw lines to the apex R, intersecting the side of the dipper 1′ T at 1′ and 5′. Now with W as center describe the semicircle 1 3 5, which divide into an equal number of parts, as shown by the small figures 1 to 5. At right angles to 1 5, and from the points 2, 3, 4, draw lines intersecting the line 1 5, as shown. From these points of intersection draw lines to the center R intersecting the side of the dipper 1′ T at 1′, 2′, 3′, 4′ and 5′. From these intersections and at right angles to the center line R W draw lines intersecting the side of the handle 5 5′, as shown. Now, with R as center and R 5 as radius, describe the arc 5″ 5‴. From 5″ draw any line, as 5″ R. Now, starting from 5″, set off the stretchout of twice the amount of the semicircle W, as shown by the small figures 5″ to 1″ to 5‴. From 5‴ and all the small figures contained in 5″ 5‴ draw lines to the apex R, as shown. Then, using R as center and radii equal to the various intersections on 5 5′, draw arcs intersecting similar numbered lines in the pattern, as shown. Trace a line through the points of intersection thus obtained. Then will U V 5″ 5‴ be the pattern for the handle.

It will be noticed that the pattern for the handle has been obtained to fit against a plane surface, as 1′ T, while in reality the handle butts against a round surface in plan, thus forming an intersection between two cones of unequal diameter. In this particular case it is better to use a short rule of this kind than to go to the time and trouble of working out a problem, for in practice the difference in the pattern is hardly noticeable. When handles of this kind are developed the rule given is practical for all purposes.

When soldering the handle to the dipper it has a tendency to break when the dipper is in use. This can be avoided by adding a lap in the form of a leaf, as shown in the pattern by X. In the pattern *a* and *b* represent two holes punched to correspond to the thickness of the wire used at the top of the dipper. In diagram Y is shown how the handle is attached; *d* representing the body of the dipper with the wire at the top, as shown, while *e* is the handle with the leaf X′ turned toward the inside and soldered.

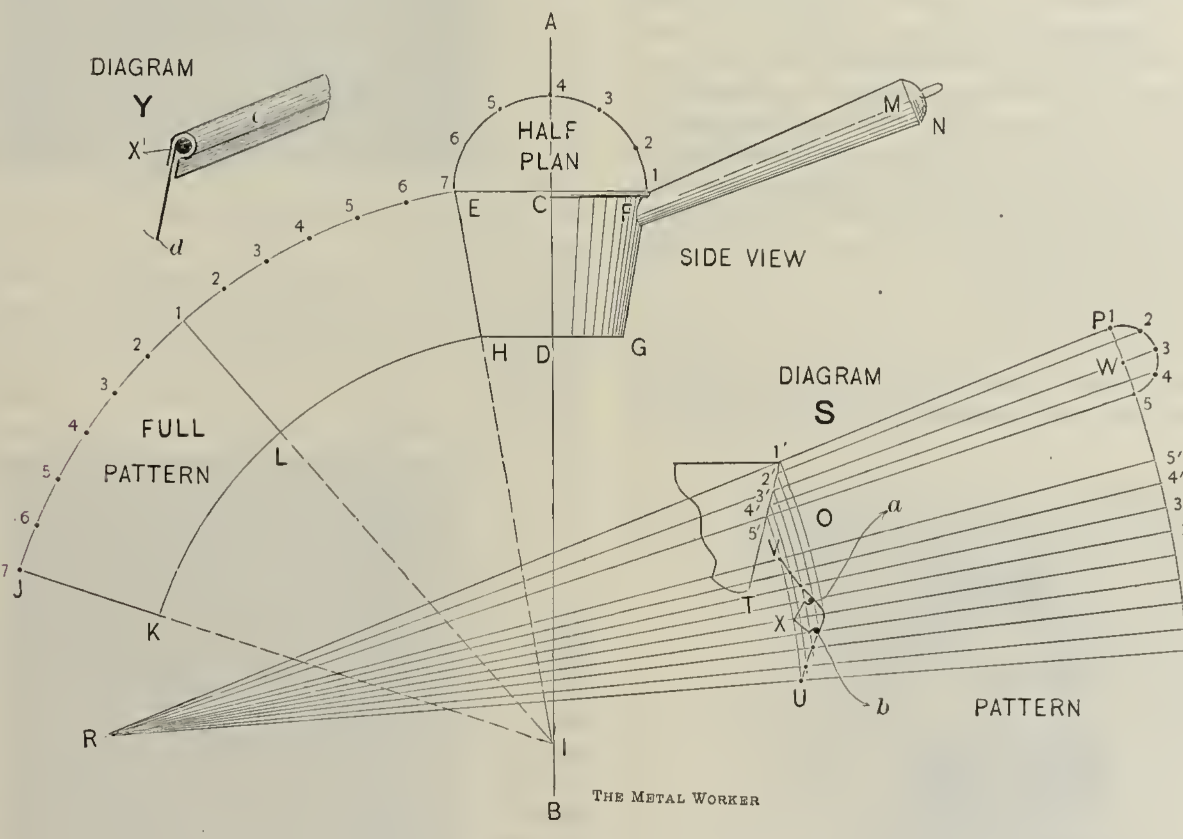


Fig. 2.—The Pattern for Dipper.

◆

TINSMITHS, cornice makers and all who have to do with soldering will be interested in the little pamphlet issued by the Grasselli Chemical Company, Cleveland, Ohio, devoted principally to the Eureka Soldering Flux. With this pamphlet comes a circular of the Snowflake Soldering Salts. The company also make an extensive line of Chemicals and Acids, useful to nickel platers and foundrymen who have occasion to clean castings.

ANNUAL MEETING OF TROY ROOFERS' AND METAL WORKERS' ASSOCIATION.

The third annual meeting, election of officers and banquet of the Master Tin Roofers' and Metal Workers' Association of Troy, N. Y., and vicinity was held at the rooms of the association, in that city, on Wednesday evening, May 7. The meeting was largely attended, and a very enjoyable time was spent. The reports of Treasurer W. A. Sherman and Secretary Fred. T. Ham showed the organization to be on a solid basis. Communications from similar organizations in different parts of the State were read and the prospects of a State organization were discussed. Several applications for membership were received. The annual address of President James Hamil was warmly received. The election of officers for the ensuing year resulted as follows:

PRESIDENT FRED. T. HAM.

President, Fred. T. Ham.
Vice-President, David White.
Treasurer, W. A. Sherman.
Secretary, Harry Packard.
Trustees: H. D. Sweet, A. McCoubrey and Leo Rivers.

The banquet proved a thoroughly enjoyable affair. A well selected *menu* was provided by the committee, and the speakers to the various toasts secured the attention and interest of the diners. David White acted as toastmaster, and introduced Edward Manogue, who spoke on "The Object and Benefits of a Master Mechanics' Association," and W. A. Sherman, on "The Relations that Should Exist Between Employer and Employed." Mr. White himself treated in a happy way "The Fraternal and Social Benefits of Our Organization."

EX-PRESIDENT JAMES HAMIL.

Supplies for Roofers and Sheet Metal Workers.

W. J. Burton & Co., who style themselves "the Quick Shippers," and whose plant is located at 160-166 West Larned street, Detroit, Mich., have just issued their new catalogue, M, which covers a wide range of goods in the line of roofers' and sheet metal workers' material and supplies and which, they state, contains several items not previously included in their line. The company claim to have facilities for manufacturing cornices and other goods such as are possessed by few other plants in the country. A feature of their equipment is a machine for crimping galvanized iron and copper, so that they can guarantee their cornices to be especially strong and substantial, and if properly painted, to present a perfect imitation of tooled stone.

The first portion of the catalogue is devoted to galvanized iron cornices in a large number of styles suitable for all classes of buildings. These are followed by sheet metal fire proof fronts, with a number of views demonstrating the handsome and attractive effects that can be produced in this style of construction. Crown and foot moldings, window and door caps and frames are next treated, together with finials, ridging, cresting and vanes, also weather vanes and steeple crosses. A section is occupied by galvanized iron ridging, cresting and finials and hip finials. Stamped and pressed zinc ornaments, urns, balusters and cornice brackets in great variety are next presented. Several pages are devoted to skylights of various patterns, sectional views being given showing the style of construction. Attention is specially called to Burton's removable skylight, which is described and illustrated in detail, and is especially recommended for ventilating hotels, kitchens, restaurants, stores, mills and factories. Automatic fire proof metal windows, made of hollow metal, window frames and sash glazed with wire, plate or stained glass, are also illustrated.

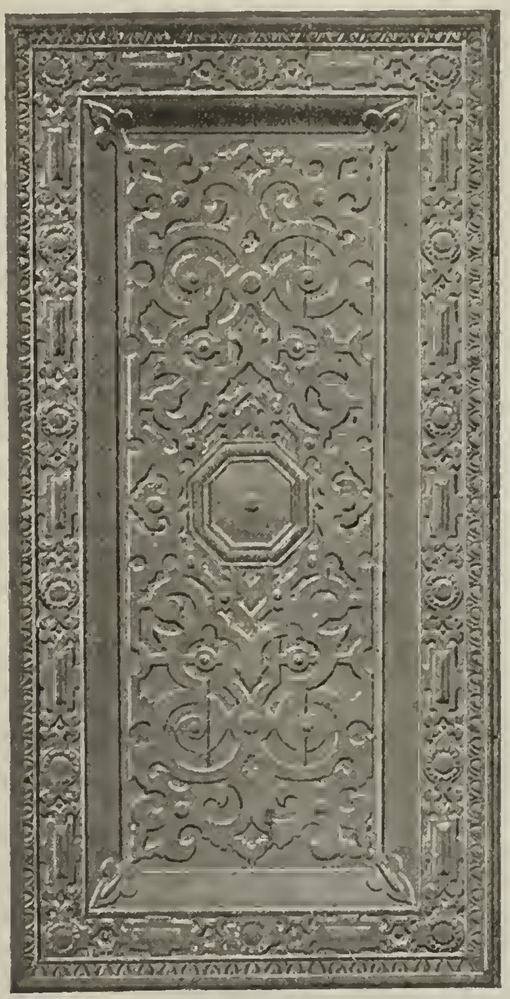
The latter portion of the catalogue is occupied by roofers' supplies, including Burton's fire proof metallic lath, corrugated iron roofing, siding and ceiling, flashing, V crimped roofing and siding, self-capping roll roofing, roof capping, iron siding and ceiling, weather board siding and brick siding, rock face stone siding, cornice and pilasters, metallic shingles and tile, felt and composition roofing, Baroid roofing and Burton's felt and burlap asphalt roofing, which is prepared with a gravel surface. These goods are followed by trimmings for felt and composition roofing, roofing paints, papers and felts, coal tar and pitch, elastic roofing cement and roofing nails.

Among the miscellaneous goods included in the catalogue are rivets and bolts, stove bolts, ladders, adjustable scaffolding jacks, galvanized iron eave trough and miters, eave trough ends and drops, roof gutters and braces, quarter circles, O. G. and box gutters, eave trough hangers, conductor strainers, conductor pipe, elbows and shoes, ornamental conductor heads and bands, malleable conductor hooks, cut offs and valleys. The statement is made that the firm are the largest buyers of tin plate in Michigan and their special brands of roofing plates are claimed to be of superior quality. They also manufacture a line of special brands of solder. Special attention is called to the Dayton sure draft revolving chimney top and the World ventilator, which are specialties of the concern.

The company carry a large stock of black and galvanized sheet iron, crimped sheets, sheet zinc, galvanized iron tanks, stove pipe elbows, nested stove pipe and a line of steel stoves; including the Special, Standard, Maple and Birch, also Burton's hot blast stove for soft or hard coal. Burton's fuel economizer and a variety of tinners' and roofers' tools conclude the list of goods in the catalogue. The last pages are occupied by views of buildings on which the company's roofing and metal work has been used. The catalogue consists of 116 pages, and is well printed and illustrated. An alphabetical index is a convenient feature of the publication.

Artistic Stamped Metal.

We present herewith three examples of the artistic effects produced in stamped sheet metal for interior decoration. The examples given are taken from the new catalogue of the Penn Metal Ceiling & Roofing Company, Limited, Hamilton and Twenty-third streets, Philadelphia, Pa. In Fig. 1 is shown an Elizabethan deep mold plate. These plates are stamped to the depth of 1⅞ inches, and the size of the plate is 24 x 48 inches. When assembled, with suitable finish, this design presents a remarkably handsome and dignified effect. The ornamental side wall panel shown in Fig. 2 is 18 x 24 inches in size, and is suitable for use with or without frames. Fig. 3 represents a zinc mounted ventilating center, 36 x 36 inches. The manufacturers of these goods claim that when properly applied and tinted artistically, they form the handsomest ceilings and side wall decorations that it is possible to secure. A feature that will recommend the use of metal ceilings and side walls is that after the first cost is met no further expenses need be incurred, as the material will last as long as the building.



Artistic Stamped Metal.—Fig. 1.—Elizabethan Deep Mold Plate.

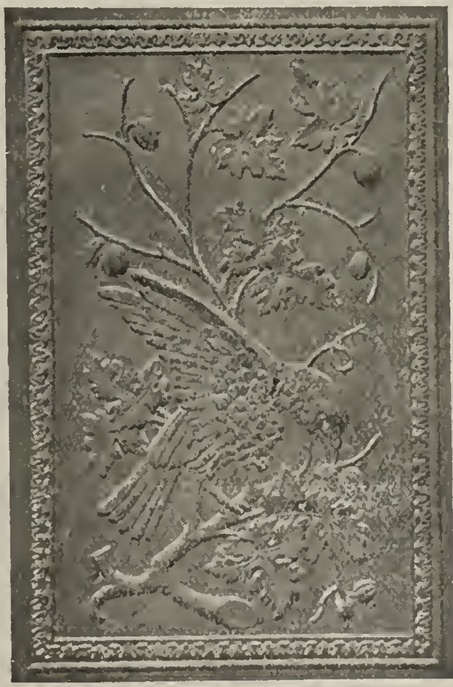


Fig. 2.—Ornamental Side Wall Panel.

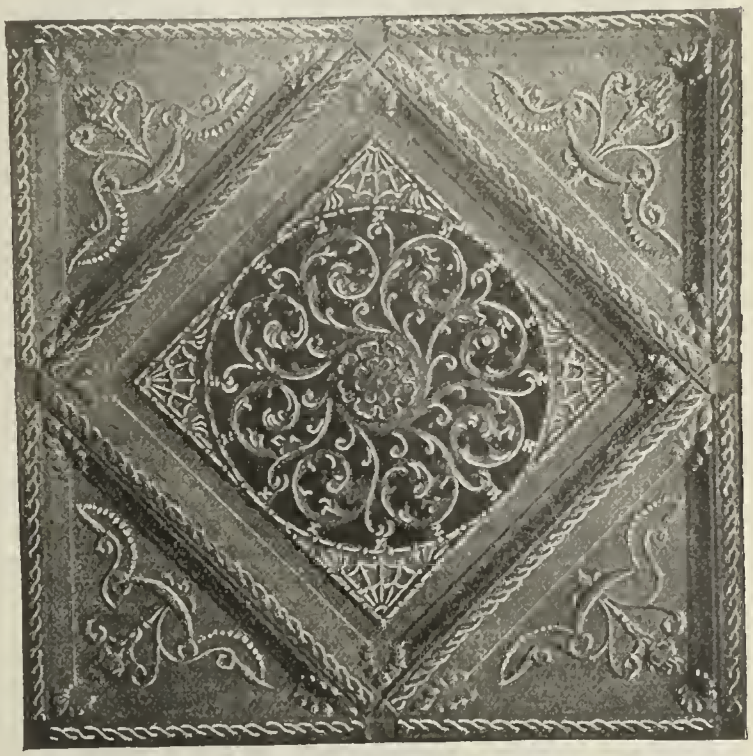

Fig. 3.—Zinc Ventilating Center.

The Vandergrift Works.

On Monday, May 12, there were shipped from the Vandergrift Works of American Sheet Steel Company, at Vandergrift, Pa., 1642 tons of sheets. This is very much the largest day's shipment in the history of this plant, the best previous record for one day being 1012 tons. The Vandergrift Works are being very much enlarged, ground having been broken recently for the building of two more open hearth furnaces, giving a complement of eight. The work of installing eight more sheet mills at this works has almost been completed, which will make a total of 29 mills in the Vandergrift plant. In the Vandergrift-Apollo unit, embracing mills at Vandergrift, Apollo, Hyde Park, Saltsburg and Leechburg, there will be a total of 54 mills. Eugene W. Pargny is district manager of the Vandergrift-Apollo unit and S. A. Davis is division superintendent, with headquarters at Vandergrift.

Clover Leaf Ventilators.

E. Van Noorden Company, 944 Massachusetts avenue, Boston, Mass., are manufacturing Clover Leaf ventilators for use on theaters, churches, halls, factories, dwellings, &c. The ventilator is made of sheet metal, usually galvanized iron, sometimes copper, and consists of a vertical pipe or barrel, surmounted by an overhanging three-gabled roof, with open vertical gables. Opposite each gable is a shield (or Clover Leaf) to deflect the wind. It is explained that when the wind blows horizontally it strikes the shield and draws the internal air out of the barrel by suction, the exit being at the spaces between the gables and shields; also that when the wind is blowing downwardly, it strikes the gabled roofs and is deflected outwardly, making a suction in the barrel and emptying the internal air at the bottom of the shields. The ventilator is referred to as being built with enough spread to insure an exit capacity equal to double the area of the barrel, thus providing for the discharge of all the air in the barrel at once.

W. H. Mullins, Salem, Ohio, has lately booked orders for Sheet Metal Boats for St. Petersburg, Russia; the Soudan, Egypt, and Madras, India.

Removing to Morgantown, W. Va.

Arrangements have just been completed by which the plants of the Steel & Iron Aluminum Coating Company and the Rolling Mill Company of North America will be removed to Morgantown, W. Va. The Steel & Iron Aluminum Coating Company are manufacturers of aluminum coated sheets, which are sold in competition with galvanized. The Rolling Mill Company of North America broke ground at South Connellsville some months ago for the building of a ten-mill sheet and tin plate plant, but the work of construction has not proceeded very far. It is understood that handsome inducements in the shape of free sites and bonuses have been given to these concerns in order to induce them to remove from Connellsville to Morgantown.

FLASHINGS.

The Star Cornice Works, Fort Worth, Texas, have just begun business in the manufacture of Galvanized Iron and Copper Cornices. They are also doing a general tin roofing and jobbing business and conduct a furnace, heating and ventilating department. The firm are composed of A. F. Diefenderfer and J. N. Bressler. Their plant, which is located at Jennings avenue and Texas street, is equipped with the latest machinery for the manufacture of Cornices and for carrying out all kinds of sheet metal work. They state that they are in the market for supplies and furnaces, and would like to receive copies of catalogues from jobbers and dealers in the lines in which they are engaged.

Lamb & Ritchie, Cambridgeport, Mass., issue a 22-page catalogue of interest to tinsmiths and roofers, which is devoted mainly to Galvanized Expanded Conductor Pipe of different styles, with Elbows and Shoes, Conductor Heads and Adjustable Fasteners and Hooks for securing them to buildings, also Plain Round Galvanized Conductor Pipe and Elbows. Ritchie's Patent Spiral Lock Seam Pipe, made of both galvanized iron and tin, is one of the specialties manufactured by the concern, who also make Speaking Tubes and Speaking Tube Fittings. The latter pages of the catalogue are occupied by Eaves Trough Hangers, Miters, Outlets and End Caps, Copper Eaves Trough, Moore's Ventilators for chimney tops and Wire Strainers for conductor heads. A circular inclosed calls attention to the L. & R. Tin Lined and Lead Lined Iron Pipe.

President George G. McMurtry of the American Sheet Steel Company has purchased a $270,000 residence at 812 Fifth avenue, New York.

The Protective Ventilator Company, 129 Fulton street, New York, are sending out a neat circular in the interest of their Protective Ventilators, designed for use in connection with windows. In application the Ventilator is located at the bottom of the window and it is designed to throw the inward currents of fresh air upward so as to obviate the effect of draft. It is provided with a wire screen to serve as a filter. The company state that those who have no brush for cleaning the Ventilators will be furnished with one free of charge on application.

The Buffalo Forge Company, Buffalo, N. Y., are distributing a neat little circular of 14 pages, showing by means of half-tone engravings the various types and styles of their Buffalo Improved Ventilator, designed for use in helping weak drafts in chimneys and, in the larger sizes, for aiding in the withdrawal of foul air, smoke and gases from churches, public buildings and factories. Attention is also called to the Buffalo fan system of heating and ventilating by means of a broken view, showing engines, fan, heater and a section of the duct with mixing chamber.

George Callahan & Co., 218 Front street, New York, advise us that they are in receipt of a large volume of orders from all parts of the country for their Elastic Paint Oil. The company say that the elastic qualities of this Oil and the fact that it does not dry brittle, crack, peel off or blister have attracted to it the favor of roofers wherever used. They started to manufacture this specialty about eight years ago and now they find that the business in this material has so greatly increased that they are obliged to extend their facilities for its manufacture.

Two hundred workmen in the copper mill of the Rome Brass & Copper Company of Rome, N. Y., struck work on Friday last, on the refusal of the company to grant an increase of 15 cents a day to men earning less than $2 a day.

Joseph F. Beck, manufacturer of Galvanized Iron and Copper Cornices, Metal Skylights, &c., has removed his place of business to 425 K street, N. W., Washington, D. C., where he has larger quarters and every facility to do sheet metal work in all its branches.

Tinsmiths and stove dealers, who are called upon to improve weak drafts in chimneys, will be interested in the little pamphlet issued by George E. Fenn, 94 Blackstone street, Boston, Mass., devoted to Fenn's Rotary Ventilators, Chimney Bases and Ventilation Bases for connection with the tops of flues.

Officials of the Lalance & Grosjean Mfg. Company of New York paid a visit to their Tin Plate works at Harrisburg, Pa., this week, and it is reported that a number of improvements are contemplated. An open hearth steel plant has been talked of as one of the new departments.

H. W. Taylor of the firm of N. & G. Taylor Company, Philadelphia, who has been abroad with his family for the last three months, sailed from Liverpool May 10 on the "Campania."

A movement is on foot at Newark, Ohio, looking toward the erection of a large Sheet and Tin Plate plant in that city. It is stated that a syndicate of foreign capitalists, through the efforts of prominent Newark citizens, have secured an option on the Forry farm of over 100 acres, where it is intended to erect the plant.

The Inland Steel Company announce that their new plant at Indiana Harbor, Ind., will be in operation in June with a daily capacity of 500 tons of Open Hearth Steel. Arrangements are being made to roll the lighter sections of Structural Angles, Channels and I-Beams at the new works, in addition to Open Hearth Billets, Slabs, Sheet and Tin Plate Bars, Shafting, Plain and Galvanized Sheets. The company have already booked orders for a liberal tonnage of Billets, Sheets and Heavy Bars for delivery extending into the second half of this year. The increase in the capital stock of the company, recently announced, was made to provide funds for extending the scope of the company's operations.

W. H. Mullins, Salem, Ohio, has issued a very artistic catalogue of Stamped and Embossed Sheet and Metal Goods. It is copiously illustrated with tinted views of tops and sides of Boats, also of Boats in use. The Boats shown include Duck Boats, with or without air chambers, which may be supplied with folding centerboard, rudder, mast and sail; Yacht Tender or Dingey, Double-Ender Tender or Fishing Boat, which may be supplied with rudder, folding centerboard and sail; Indian Canoes and Sectional Canoes. A portion of the catalogue is devoted to what purchasers have to say of these Boats.

Warren B. Thomas and others of Johnstown, Pa., have bought the Tin Plate plant at that place which was dismantled by the American Tin Plate Company, and will remodel it for use in a new line of Iron and Steel manufacture.

Joseph McCreery, 637 Infirmary Road, Toledo, Ohio, is sending to the trade circulars describing the McCreery Pressed Bent Elbows, which are made in all sizes from 3 to 8 inches in diameter, and of No. 27 gauge galvanized iron and lighter. These Elbows are stamped out of black iron in halves, while hot, in polished cast steel pipes, and are neatly double seamed together in the throat and on the back with a fine double seam, making them perfectly smooth inside and out. The double seam running lengthwise of the Elbow adds to its strength.

The Columbia Can Company of 5 North Arlington avenue, East Orange, N. J., have been incorporated, with a capital of $200,000, by Jackson Marsh, Henry Hosier and William C. Cox.

ANNUAL CONVENTION OF THE CONNECTICUT MASTER PLUMBERS' ASSOCIATION.

The twelfth annual convention of the Connecticut Association of Master Plumbers was held in Bridgeport Wednesday, May 14. The meeting was called to order at 10.30 a.m. by President M. W. Manwaring, with a very satisfactory attendance, delegates being present from all parts of the State. Mr. Manwaring expressed his satisfaction at seeing so many representatives of the craft present, and gave them a cordial greeting, concluding by introducing Denis Mulvihill, Mayor of Bridgeport. Mr. Mulvihill, in a few appropriate remarks, welcomed the delegates to the city, and expressed his pleasure at meeting so large a number of the members of one of the most important and necessary trades. James Donovan of Middletown responded for the delegates in his usual pleasing manner, after which the meeting got under way.

Norman S. Gadden of Bridgeport and P. F. Connolly of New Haven were appointed sargeants-at-arms, and the president appointed the following committees:

Credentials: G. S. Bull and T. F. Langdon of Hartford, T. E. Logan and H. B. Middlebrook of Bridgeport, C. S. Belfit of Waterbury.

Membership: Theodore A. Potter and William McDonald of New Haven, G. W. Miner of Waterbury, J. F. Brady of Bridgeport, T. L. Dowling of Hartford.

Auditing: C. U. Neumann of New Haven, J. M. Page of Naugatuck, F. C. Booth of Bridgeport.

Resolutions: L. H. Mills of Bridgeport, E. Mahl of Hartford, T. W. Corbett and S. E. Dibble of New Haven, T. D. Barlow of Waterbury.

The roll call was responded to by a larger number of delegates than had been in attendance at any convention for a number of years. Letters were read from President E. D. Hornbrook of the National Association expressing regret at his inability to be present, explaining in detail the Cleveland Resolutions and giving information concerning the national convention at Atlantic City in June. A letter was also read from Mr. Manwaring, chairman of the Essay Committee, suggesting topics for essays to be presented at the National Association. John Donovan reported for the Legislative Committee, S. E. Dibble for the Sanitary Committee and F. F. Hitchcock for the Essay Committee. Mr. Hitchcock also read a paper reviewing the past year. L. H. Mills reported for the Apprenticeship Committee.

President Manwaring read his report covering the work of the year, showing some additions to the membership of the association, urging personal effort in carrying out the objects of the association and a more comprehensive plan for interesting all master plumbers of the State in the association. He paid a touching tribute to the late James Ahern of Hartford, and spoke enthusiastically of the cordial support of his associate officers.

The report of the Executive Committee was read, giving in detail the work of the board for the year. The report of Financial Secretary G. S. Bull was also read, as was the report of Treasurer John Donovan, showing a balance on hand of $845. E. Mahl reported for the Memorial Committee. He paid a high tribute to the late James Ahern of Hartford, expressing appreciation of his value to the association while living.

F. F. Hitchcock of Woodbury and T. D. Barlow were appointed to prepare a suitable memorial to Mr. Ahern.

The Committee on Resolutions recommended a resolution of sympathy for A. H. McMahon of New Milford, whose place of business was destroyed by fire in the big conflagration in that town. Several important matters concerning the trade were then considered in executive session. The Cleveland Resolutions were unanimously indorsed.

The election of officers for the ensuing year resulted in the unanimous choice of the following:

President, C. E. Coe, New Haven.
First Vice-President, Edward Mahl, Hartford.
Second Vice-President, F. F. Hitchcock, Woodbury.
Financial Secretary, G. S. Bull, Hartford.
Corresponding Secretary, H. B. Bushnell, New Haven.
Treasurer, James Donovan, Middletown.
Delegates to National Convention: M. W. Manwaring and James Donovan.

The thanks of the convention were given to the retiring officers, and Mr. Coe, the newly elected president, in a few remarks, assured the delegates that he would do all in his power to faithfully perform the duties of his office. Adjournment was then taken to the Atlantic Hotel, where about 125 sat down to the annual banquet.

After the business meeting President Coe received the congratulations of the delegates on his election, and also on the arrival of a new plumber in his home in the shape of a bouncing baby boy.

Among the visitors were M. E. Norton of the Plimpton & Hills Corporation, Hartford; R. H. Maguire of F. W. Webb Mfg. Company, Boston; R. B. Hamel of the Alberene Stone Company, New York; Wm. Robinson of John A. Murray Company, New York, and William Wall of the W. H. Page Boiler Company, Norwich, Conn.

THE HEATING ENGINEERS' SUMMER MEETING.

Secretary W. M. Mackay of the American Society of Heating and Ventilating Engineers has issued, under date of May 14, a further notice to the effect that the fifth semiannual meeting of the society will open at Hotel Rudolf, Atlantic City, N. J., on Monday, June 16, and that the meetings will be held at 10 o'clock a.m and 2 and 8 p.m. The Hotel Rudolf has made a special rate of $3 per day and upward, on the American plan, to members and others attending the meeting, with a reduction if two or more persons occupy the same room.

The secretary requests that papers and topics for discussion to be presented at this meeting should be in his hands before the end of May. A large number of members have signified their intention of being present, and there is every indication of a well attended and successful meeting. While the society is not able to guarantee a sufficient number to secure a rebate in the railroad fare, arrangements have been made with the National Association of Master Steam and Hot Water Fitters, who hold their convention at the same place on June 12. 13 and 14, so that any members of the Society of Heating and Ventilating Engineers who wish to avail themselves of their rate of one fare and one-third can do so, provided they reach Atlantic City before the close of the steam fitters' convention on Saturday, June 14, by procuring a certificate to the National Association of Master Steam and Hot Water Fitters' convention when purchasing their tickets.

A Chicago Heating Supply House.

The Chicago Heater & Supply Company, Chicago, Ill., advise us that on account of the increase in their business they are obliged to move into larger quarters at 33 Dearborn street, where they expect to have one of the most attractive and complete showrooms of heating goods in the city. The company have also secured additional storage capacity and will carry a complete line of Richmond round and sectional boilers and tank heaters, made by the Richmond Stove Company of Norwich, Conn., for which concern they are the Chicago representatives. They will also carry a complete line of Utica Imperial round and sectional boilers and Utica heaters made by the Utica Heater Company of Utica, N. Y., which concern they represent in Chicago, together with radiator valves and all steam fitters' supplies. The company expect to make a record for prompt shipment of anything in the heating line. They are also Eastern representatives of the Ohio Brass Company of Mansfield, Ohio, who have recently produced from new patterns a complete line of steam and hot water radiator valves and globe, angle, check and gate valves. These valves are of superior finish and are heavier than any of the regular standard make of valves. The officers of the Chicago Heater Company are: Clarence M. Converse, president; Martin E. Converse of Winchenden, Mass., vice-president, and Thomas B. Emery, secretary and treasurer. They will be glad to send catalogues and prices of any goods in their line to those desiring the same.

BROOMELL'S PATENT VAPOR SYSTEM.

The progressive heating contractor endeavors first to thoroughly master the art of installing heating apparatus successfully, and then devotes his energy to lopping off unnecessary expense attending the work. It has been said that the steam fitting trade throughout the United States have become familiar with all the details of the usual two-pipe system of steam heating, and that those who are progressive are still reaching out for some modification which will preserve the efficiency while reducing the expense of installation and the fuel bill. For the past two years considerable attention has been given to Broomell's patent vapor system and the special apparatus used in connection with it that has been put on the market by the Vapor Heating Company of York, Pa., and 917 Arch street, Philadelphia.

Broomell's Patent Vapor System.—Fig. 1.—Elevation, Showing Piping, Radiators and Apparatus.

All steam fitters are aware that it is necessary for air which occupies the radiators and the steam pipes to be expelled before steam generated in the boiler can circulate through them and successfully effect the heating of a building. If any portion is air locked, failure to heat satisfactorily will be the result, and it not infrequently happens that, through negligence in attention to positive air valves or to imperfections when automatic air valves are used, the radiators do not heat properly. The salient feature of the Broomell vapor system is the exhaustion of this air from the heating system, so that it is not necessary to raise the pressure of steam in the boiler to secure a circulation of vapor and heating.

An elevation of a heating system is shown in Fig. 1, in which the Broomell patent vapor system, equipped with the necessary apparatus, is used. When a fire is started and the draft in the chimney is accelerated, owing to the heat applied, the suction is utilized for drawing the air out of the pipes and radiators of a heating system by means of special appliances. The steam passes from the boiler through the piping system in the usual manner, and, owing to the exhaustion of the air, it is frequently unnecessary to raise more than the vapor that arises from the heated water before it reaches a boiling temperature. The amount of vapor admitted to a radiator for heating a room is regulated by means of the special valve shown in Fig. 2, having ports of different sizes, so that the supply to the radiator and the heating can be regulated to the requirements. After the vapor has passed through the radiator, either in the form of condensed water or water with which more or less vapor may be carried, it passes to the combined receiver shown in Fig. 3, all of the condensed water returning from the heating system passing through the receiver, which is a cast iron cylinder with a glass gauge graduated on the inside and an open top having a hinged lid. A copper float is connected by means of a brass chain with a hinged lid and also with the damper of the boiler. The receiver also has a special safety valve.

In operation, all the return pipes from the building are connected with the receiver, and when there is no pressure in the boiler the water in the receiver will stand at the same level as the water in the boiler. When any pressure is produced in the boiler the water will accumulate in the receiver until it overcomes the pressure, when it will flow into the boiler by gravity. The dampers of the boilers are controlled by the rise and fall of the float with the hight of the condensed water in the receiver. By this means, when the dampers permit the fire to burn briskly and generate pressure, the accumula-

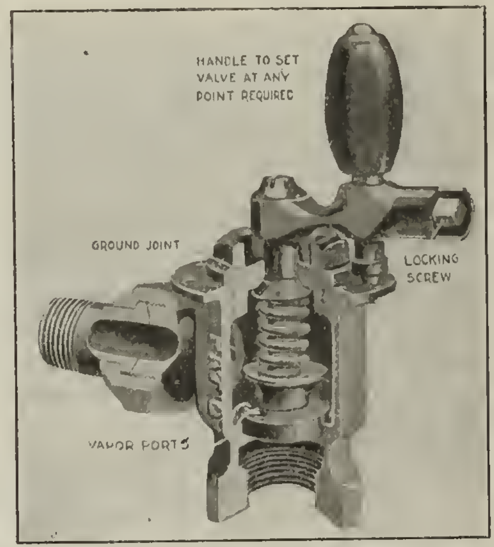

Fig. 2.—The Special Valve.

tion of water will so operate the dampers that the draft will be reduced, and with it the pressure. As the water returning from the radiator passes into the receiver, the air will pass out through the condensing coil shown in Fig. 1, and any vapor it may contain will be condensed in this coil, which is usually placed under a register in the floor so that the heat generated may be utilized. Through the condensing coil the receiver is connected with the chimney by means of a pipe, so that the whole heating system is open to the atmosphere, and it is practically always free from pressure, but subject to a suction equal to the draft of the chimney.

The simplicity of this method of removing the air from radiators makes it readily understood and enables the system to be successfully installed by all steam fitters. It is pointed out that with this system smaller sizes of pipe may be used for heating a building than would be required with the ordinary two-pipe system. This enables the heating contractor to install heating plants in buildings with the ordinary tools with which his shop is equipped. Owing to the radiators being evenly heated throughout their entire surface and without the boilers being so fired as to raise the pressure, it is claimed that a more satisfactory heating is effected with a substantial economy in the consumption of fuel. The company have published a catalogue giving a detailed explanation of this system, and they invite investigation of it. They are prepared to render such assistance as may be needed by those who desire to profit by the installation of their vapor system in their vicinity.

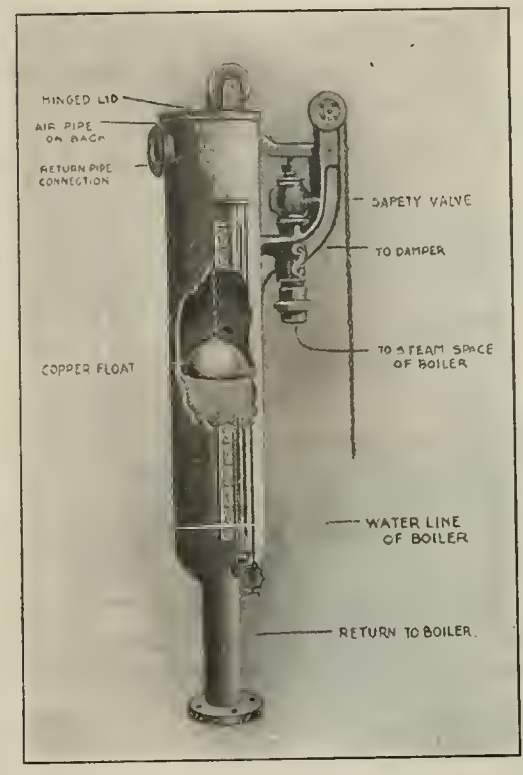

Fig. 3.—The Combined Receiver, Relief Apparatus and Damper Regulator.

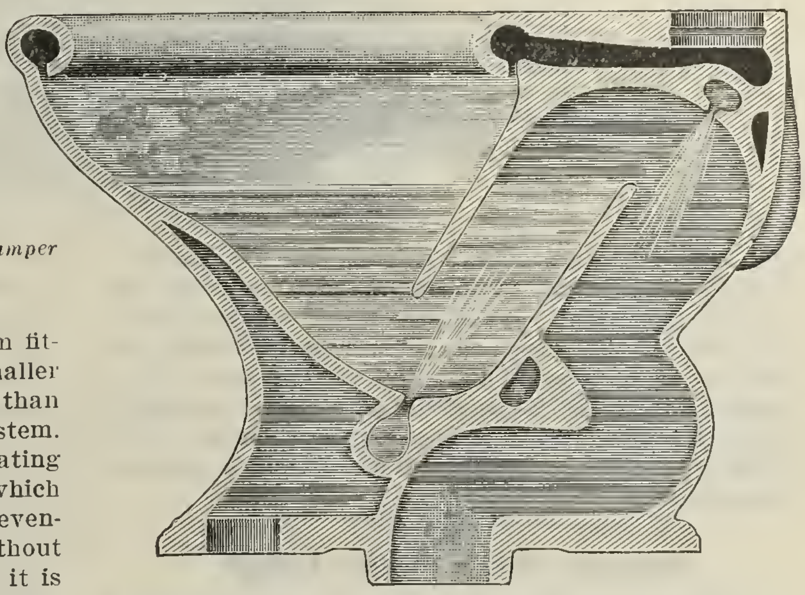
Town Lighting with Acetylene.

An opportunity for opening up a profitable line of business is presented to enterprising tradesmen in small towns throughout the country in the acetylene lighting field. The excellence of the light afforded by acetylene gas and the ease with which a complete street lighting system may be installed should make this branch of work highly popular as well as remunerative to those who take it up. The Abner Acetylene Gas Company, 32 La Salle street, Chicago, who make a specialty of the Abner acetylene gas generators, purifiers and appliances, have recently issued a pamphlet of 20 pages devoted to this branch of their business. A feature of the book is a folding sheet, 9 x 26 inches in size, showing in plan and elevation a complete acetylene gas generating plant suited to a small town. The different parts are numbered and the text gives a complete explanation of the apparatus, with directions for installing it. Useful information as to the cost of installing and operating such a plant is also given, together with additional illustrations designed to make the explanation of such systems more clear. The book also explains the apparatus and installation of plants adapted for lighting several residences grouped together in a suburban section. Investigation of the apparatus by those who have the facilities for taking up its sale is invited by the manufacturers.

A Low Down Siphon Jet Closet.

Since the advent of the low down flush tank for water closets, this type of fixture has acquired a wide popularity, and special attention has been given to the construction of closets adapted for use with this device. The Great Western Pottery Company, Kokomo, Ind., make a variety of closets designed for use with low pressure flush tanks. In the accompanying illustration is presented a sectional view of their low down siphon jet closet. This closet is of special construction, having two distinct jets, one opening into the trap at the lowest point and throwing the water resting in the bowl and outlet, forming a seal, up and over into the back leg of the closet, at which point it is met by a downward jet, thus producting a rapid, strong and effective siphonage. This arrangement of jets is looked upon by the company as the best, although they also make the closet with two jets leading to the lower jet opening, where such is preferred. Closets constructed as shown, with the slight pressure afforded by low down flushing tanks, insure a prompt siphonage and scouring of the closet bowl through the use of the two jets, which fill the back leg of the closet with water to the practical exclusion of air. This produces as effective a siphonage as can be desired.



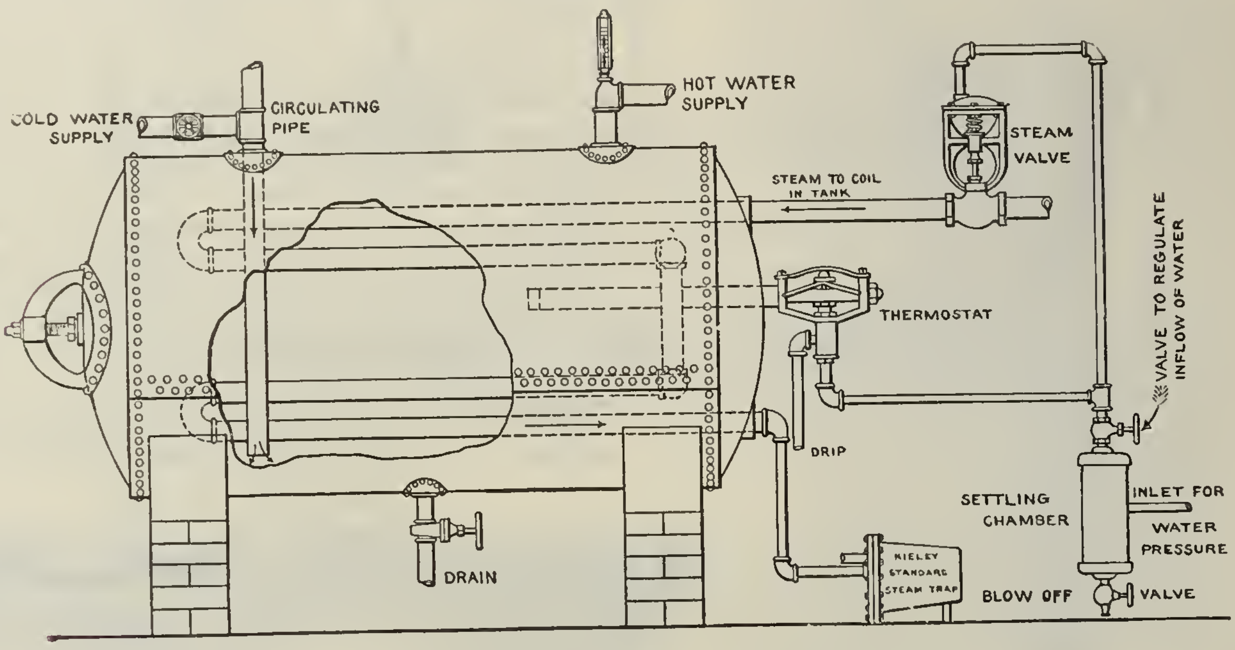
A Low Down Siphon Jet Closet.

In addition to this closet the company make an extensive variety of siphon jet wash down and wash out, plain and embossed. The closets are all made of a high grade of vitreous china and are stamped with the trademark of the company, so that those who buy can be sure of the character and quality of the goods they receive. The company's catalogue, recently issued, not only gives cuts and descriptions of the goods and the various fixtures used in connection with them, including vitreous china flushing tanks, but also contains plan views giving all the dimensions that may be needed by a plumber for roughing in the pipes to suit the goods to be connected with them when the building is ready for occupation.

The Thomas Iron Company, Waukegan, Ill., issue a 48-page catalogue devoted to the extensive line of Radiator Valves for steam and hot water heating, also Gate Valves and Stop Cocks, Check Valves, Meter Cocks, Safety Valves and Pressure Reducing Valves, used by the heating contractor in his work. Water Gauges are also shown in the catalogue.

The Thermo Hot Water Temperature Controller.

A substantial saving of steam, consequently of power and expense, has been effected wherever care has been taken to shut off the steam supply when the temperature of the water furnished in apartment houses, hotels and institutions has reached a satisfactory temperature. Where this has been left to the engineer or caretaker the water often becomes overheated and the steam wasted through want of attention at the proper time. This has led to the production of various thermostatic devices for shutting off the steam supply when the water is sufficiently heated. In the accompanying illustration is shown one of the many ways of applying the thermo hot water temperature controller made by Kieley & Mueller, 7 to 17 West Thirteenth street, New York City. The thermostat extends into the boiler, so that the temperature of the water in it directly influences its operation. When the water reaches the desired temperature expansion affects the controlling features of the thermostat and shuts off the steam valves supplying steam to the water heating coil. The simplicity of its construction and operation enables the device to be readily attached by the plumber and to continue durable in use.



The Thermo Hot Water Temperature Controller.

American House Heater Gauge.

To meet the requirements of the manufacturers of steam and hot water boilers and of heating contractors, the American Steam Gauge & Valve Mfg. Company, Boston, Mass., have brought out a special house heater gauge, as shown in the accompanying illustration. These gauges have been adopted by several of the large manufacturers of house heating boilers. They are of the Bourdon single spring type and are so constructed as to prevent corrosion of the moving parts. Consequently, they are well adapted for use in cellars and basements, where the heating apparatus is usually placed. The figures marked on the dial are large and plain, making the gauge easy to be read under the conditions in which it is usually found. The company state that a siphon should be used in the connection of these gauges.

The American House Heater Gauge.

THE WRECK OF A COPPER BOILER.

BY BEANTOWN.

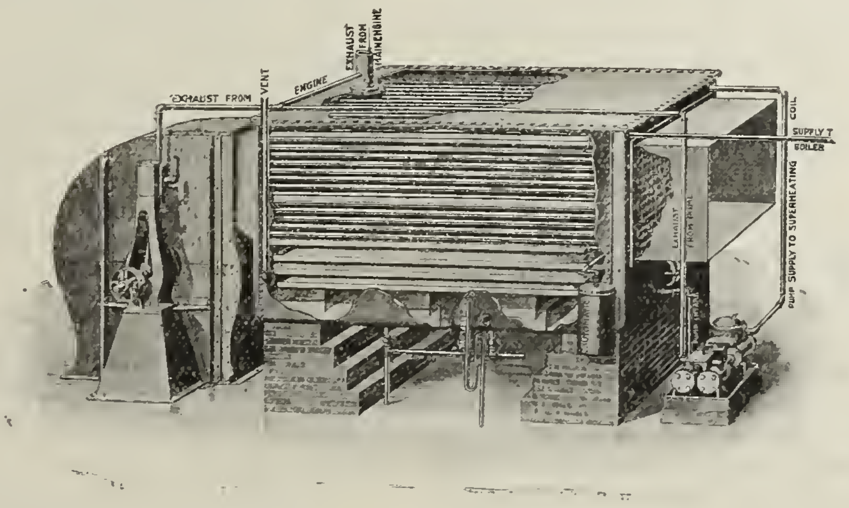
The wreck of a copper boiler recently occurred in New England under circumstances that on consideration somewhat lessen the surprise at the event. The boiler was of the seamless variety, joined in the center with a band over the point of connection and soldered. It was operated under a pressure of 125 pounds. No water had been drawn for some time and the water back was subjected to a heavy firing. When the wreck came, the upper section of the boiler parted from the lower section and struck the floor beams, assuming somewhat the shape of a dish pan. The downward force was sufficient to break the circular rim of the boiler stand and push the bottom down over the two upright cast iron supports. The floor above the boiler was raised about four inches and a pail that was on the floor was thrown forcibly up against the ceiling. The door of the apartment in which the boiler was placed was wrenched from its hinges and driven bodily through another door several feet distant.

The damage is of less interest, however, than the search for the cause of the wreck. In my opinion, with the boiler working under such a heavy pressure and being so strongly fired, the water in it was raised to such a temperature that the strength of the solder joining the two parts was reduced until it would not stand the pressure, and the parts were driven asunder. Naturally, as soon as the boiler sections separated, the water it contained changed at once to steam and gave all the appearance of the boiler having been filled with steam previous to the wreck. But, in my opinion, the water was at as high a temperature in confinement as the steam when it was liberated, and this led to the weakening of the soldered joint and permitted the separation. According to a table before me, water at a pressure of 125 pounds would be heated to a temperature of nearly 350 degrees, and in all probability it reached in this case a higher temperature before the break.

John Stuckenburg, St. Louis, Mo., has purchased property which he will remodel to make it a first-class plumbing establishment.

The Keller Feed Water and Air Heater.

In the accompanying illustration is presented the Keller feed water heater, purifier, condenser and hot air blast apparatus combined, which is being put on the market by the National Steam Economizer Company of Springfield, Mass. It is designed to utilize the exhaust steam from power plants for heating the feed water to boilers, for extracting the grease from exhaust steam condensation, and for heating the building in which it may be installed, by means of the hot blast system. As will be seen from the cut, the apparatus consists of a steel chamber through which a series of tubes pass for the double purpose of condensing the steam and heating the air, the claim being made that air delivered from the heater has a temperature of about 160 degrees. After the exhaust steam passes over these pipes and a spray of feed water has been thrown into it to effect the condensation of the steam it reaches the settling chamber. When the condensation reaches the settling chamber, instead of boiling, it is quiet and allows any sediment to settle to the bottom. In passing to the settling chamber the exhaust steam passes over baffle plates for the purpose of allowing the grease and oil to become deposited where it can readily be drawn off, and preventing the return to the boiler to form scale. From this lower chamber the condensation is pumped through the superheating coils surrounded by exhaust steam into the upper part of the heater, and is sent to the boiler at a boiling temperature to aid in the quick generation of steam.



The Keller Feed Water and Air Heater.

The heater is made both with a hot air attachment, as shown, and without it. When used in connection with a fan the hot air can be used for heating a building, for drying paper, lumber or other materials, for preventing the freezing of the ore and material going through rock breaking and ore crushing machinery, and to prevent the dirt from adhering and freezing fast to them. A portion of the hot air may also be used directly under the grates of the boilers for promoting a more perfect combustion. The company issue a catalogue fully illustrating and describing the apparatus and the various uses to which it can be put, with instructions for its installation.

The Saturday Half Holiday in the New York Supply Trade.

For several years past the tendency of the firms in the plumbing supply and steam heating supply trade in New York City has been toward closing down for a half holiday on Saturdays during the summer months. At first this took the form of closing by certain concerns during two or three months of the hottest part of the summer, but within recent years the custom has spread to such a great extent that it may now be considered general. Through the efforts of four or five men connected with the supply trade the closing down on Saturdays this year was started much earlier than in previous years and as a consequence all of the houses in the supply trade have been closed since the first Saturday in May. This is to continue until the last Saturday in September. The jobbing trade have issued notices to their customers that their stores in the metropolitan district will be closed at 1 p.m. on Saturdays during the summer months, commencing with Saturday, May 3. In order to facilitate matters, they have asked out of town customers to arrange that all their communications shall reach the jobbers as early on Saturdays as possible, in order that they may receive prompt attention.

New York City Notes.

Frederick Schlüchtner, former president and an active member of the Brooklyn Master Plumbers' Association, died suddenly last Wednesday morning. Under the firm name of Schlüchtner Brothers, he and his brother conducted a large hardware, roofing and plumbing business, at Atlantic and New Jersey avenues, in the East New York section of Brooklyn. The business was established many years ago by his father. The funeral, which took place on Friday, was largely attended by members of the Brooklyn branch.

⁂

Many plumbers are getting ready for a good season's work. Among the jobs reported since last week are those of J. J. McGrath, who has a loft and business building on Broadway, north of Nineteenth street; and Charles Hensle, with a row, 100 x 86 feet, at 140th street and Eighth avenue, and a large apartment on Forty-seventh street. W. G. Jack & Co. have two tenements at 94 and 96 Lawrence street.

⁂

The plumbers in Manhattan begin to feel easier, now that they about know how to figure wages, as it has been practically settled that the prevailing rate of wages will be $4.25 a day from June 15, with a half holiday on Saturday. This will be all right on new work, but many plumbers doing a jobbing business have had hard work to keep up when the rate was $3.75.

⁂

There are many private houses or mansions going up in the Murray Hill section of the city on the West Side, and east of Central Park. James Muir is plumbing one five-story building, 50 x 85 feet, at 3 East Seventy-fifth street; James Armstrong has one at 11 and 13 West Fifty-third street; Griffin & Seddon have one of 50 feet front on Fifty-first street near Madison avenue, and W. H. Quick has another of 34 foot front at 165 and 167 East Seventieth street; J. F. Boyle is doing the plumbing in a row of 16 houses on Seventy-fourth street west of Central Park West, while H. P. Mills & Bro. are practically replumbing the house at 124 West Seventy-second street, and James Armstrong is plumbing the telephone building at 126 to 130 Orchard street.

⁂

Among the large jobs downtown are those at the Hanover Bank, which is being done by J. N. Knight & Son, and the building at 72 and 74 Broadway, which is being built by Fuller Construction Company and the plumbing of which is being done by W. G. Cornell.

New German Acetylene Generator.

In answer to inquiries from the United States, Consul-General O. J. D. Hughes of Coburg reports that Erik Cornelius, chemist at the carbide factory at Trollhattan, has invented a new acetylene generator. This generator, says the Consul-General, is described as being much simpler in construction than any yet placed upon the market, and occupies but little space. In its operation, the falling of the carbide into the water is automatically regulated by a hollow rubber ball, which, as soon as it is filled with gas, closes the valve between the carbide and the water. When the volume of gas decreases, the rubber ball contracts and the feed valve again permits the carbide to drop. The gas is stored partly in the rubber ball and partly in the space between the funnel-shaped carbide magazine and the water. If more than the normal amount of gas is generated, it secures more room by forcing the water through valves into the water jacket in the sides of the apparatus. A separate gas tank is therefore not needed. Should too much gas be produced, both the water and the gas escape through a safety valve. Common carbide is used; no cartridges. The gas is dried by being allowed to pass through the carbide magazine, where the carbide absorbs the moisture. As there is no gas tank, and as the quantity of gas thus stored is insignificant, it is considered that the fire insurance companies will, without raising the premiums, approve of the apparatus, even when it is placed in dwelling houses.

Heating and Plumbing Notes.

It is reported that President Trainor of the Maryland State Board of Plumbing Examiners stated a short time since that there were in Baltimore 500 plumbers working without licenses, and that the Police Department had been authorized to apprehend those violating the law. In future no plumbing permit will be granted in Baltimore unless the applicant presents evidence that he is a licensed plumber.

The Board of Examining Plumbers of Rensselaer, N. Y., held their regular meeting on Monday, April 28. Two applicants for a plumbing license were examined, one of whom secured a percentage of 82 and was awarded a license. The other made a percentage of 24 and his application was refused.

The Hubbard Furnace & Steam Heater Company, 420 North Calvert street, Baltimore, Md., issue an attractive little pamphlet showing a variety of Steam and Hot Water Furnaces, as well as single and double length Ranges for kitchen use.

The Master Plumbers' Association of Plainfield, N. J., has petitioned the local Board of Health to make provision for the issue of licenses under the new sanitary code to plumbers doing work in that city.

Plumbers will be interested in the catalogue of the Cleveland Faucet Company, Cleveland, Ohio, which is devoted to Brass Work and a variety of Fittings used for the fitting up of restaurants and bars, including Beer Pumps, Air Compressors and also a complete line of fixtures for soda water fountains. A large portion of the catalogue is devoted to Iron Boxes and Cabinets for keeping beer, ale and other liquids cooled.

The Buffalo Forge Company, Buffalo, N. Y., report the usual brisk demand for the goods which they manufacture. Among important contracts recently awarded to them is the equipment of the Pennsylvania Steel Company's forge shop with 20 Buffalo Down Draft Forges, by means of which all smoke and gases are completely exhausted. Three large Buffalo fan system heating plants for heating and ventilating the wood working mill, passenger coach paint shop and freight car repair shop on the Lake Shore & Michigan Southern Railroad, at Collingwood, are also in hand, and the Bowery Bay Building & Impovement Company, New York City, are being furnished with a 200 horse-power horizontal center crank engine for an electric lighting plant. The latter company bought the Buffalo Forge Company's engine which was awarded the gold medal at the Omaha Exposition in 1898. The order just entered calls for the same type of engine of larger horse-power.

The American Warming & Ventilating Company, Elmira, N. Y., have sent us a copy of their catalogue A, devoted to Sanitary Appliances. The catalogue consists of 20 pages and shows Ventilating and Water Flushing Latrines for urinals, especially adapted for use in schools and public buildings. Plate pages show broken views of a range of Closets having an automatic dumping tank at one end, which thoroughly scours and flushes the Latrines periodically, and which is connected with the vent flue at the back. This, in turn, connects with a large ventilating flue in which one of the company's Stack Heaters is designed to be placed, to create a continuous up draft. These fixtures are so constructed that they can be extended in length to meet the requirements of the buildings in which they are placed. The text gives such explanation as is needed to make the construction and operation of the fixtures, shown very clearly by the engravings, more readily understood. Tables give the prices. Those who are called upon to do this class of work will be interested in the fixtures shown in the catalogue.

R. W. Reid, manufacturer of Plumbers' Brass Goods and Supplies, sustained a loss by fire in his factory in Brooklyn, N. Y., last Saturday.

John M. Taylor, general manager of the Dominion Radiator Company of Toronto, Canada, and his brother, Adam Taylor, assistant manager of the company, have resigned to enter into the foundry business at Guelph, Ont. Both have been with the Dominion Company since its inception in 1887.

Plumbers who are called upon to connect plumbing fixtures and nickel plated pipes and fittings will be interested in the circular of the Parmelee Girdle Pipe Wrenches, which are designed for screwing up highly polished nickel plated pipes without marring their surface.

A fire, doing damage to the extent of $1000, recently occurred at the establishment of the Gainesville Plumbing Company, Terrell, Texas.

C. W. Fowler has been appointed Plumbing Inspector of Des Moines, Iowa.

We have received from President E. D. Hornbrook of the National Association of Master Plumbers a copy of the issue of May 1 of the "Directory of Recognized Master Plumbers," which shows an increase in numbers.

The strike of the Plumbers', Steam and Gas Fiteers' Union, at Louisville, Ky., has been settled by compromise, the employers agreeing to pay a wage of $3.50 for a day of nine hours.

Thomas Kelly & Brothers, Chicago, Ill., distribute some interesting literature relating to their Automatic Operating Water Closets, Self Closing Cocks, Water Cushions, and a variety of specialties adapted for plumbers' use.

Edward D. Preston, Inspector of Buildings in the Department of Public Safety, Baltimore, Md., will receive bids until May 21 for a heating and ventilating system to be installed in the school building at Lakewood avenue and Orleans street.

A piece of trade literature very attractively prepared and illustrated is issued by the Humphrey Mfg. & Plating Company of Kalamazoo, Mich., in the interests of the Crescent Instantaneous Water Heater, adapted for use in residences, barber shops and restaurants, or any place where a supply of hot water is needed quickly. With the catalogue come circulars giving prices and also showing Stands for supporting the Heaters.

Louis P. Bitz, Rye, N. Y., has removed his plumbing shop from the Daly Building to Justice Baruch's building on Purchase street, which has recently been remodeled.

The catalogue issued by the C. M. Kemp Mfg. Company, Baltimore, Md., contains many specialties that can be used with profit by the plumber, including Cellar Drainers, Soil Pipe Test Plugs, the Climax Wrench and Die Stock, Pipe Wrenches, Pipe Vises, Fire Pots for tinners, and the Climax Gas Machine, designed to manufacture illuminating gas from gasoline for lighting country residences.

David Price, Quartermaster, Fort Getty, S. C., will receive sealed proposals in triplicate until June 4 for heating one double barracks, one single barracks, one commanding officer's quarters, five captains' quarters and three liutenants' quarters by the hot air system; also for heating the hospital by the hot water system. All the buildings are located at Fort Getty.

Red Jacket Mfg. Company, Davenport, Iowa, are distributing their catalogue No. 30 of 216 pages, which illustrates with list prices the company's Red Jacket Hand and Power Pumps, Tubular Well Valves, Cylinders and Rod Couplings, Well Supplies, Galvanized Pipe, &c.

The American Steam Gauge & Valve Mfg. Company of Boston, Mass., with branch offices in New York and Chicago, make an extensive line of Valves adapted to the use of the heating contractor, and also a variety of Gauges for recording steam and air pressure.

J. P. B. Sadtler, 231 Park avenue, Baltimore, Md., is sending to the trade a circular showing the Heller Heater using gas for fuel and designed to be used in connection with an ordinary kitchen boiler, without interfering with the water tank connections. The Heater is so made that it slips around the bottom connection and can be removed when not in use.

The Harrisburg Pipe & Pipe Bending Company, Harrisburg, Pa., are about to erect a $30,000 addition to their plant, including two new buildings of steel construction.

Manufacturers and plumbers who are called upon to devise Ball Cocks to operate under high pressure will be interested in the price-list issued by the Hercules Float Works, Springfield, Mass., who make Seamless Copper Floats, both round and oblong in shape, and also Air Chambers guaranteed to work under a pressure of 150 pounds.

The New York Blower Company of Bucyrus, Ohio, are building four 15-foot Mechanical Draft Fans for the new power plant of the Third Avenue Elevated, New York. They are also building eight 9-foot Fans for Government installations.

Further additions are shortly to be made to the plant of the Sanitary Supply Company, at New Castle Junction, Pa., consisting of two new kilns for burning the clay, and the construction of new stock and storage rooms.

George H. Porter, Jackson, Mich., has secured the contract for plumbing and heating the Otsego Hotel in that city.

A fire visited the plumbing shop of W. C. Mayhew, at 36 North Connecticut avenue, Atlantic City, N. J., on Saturday last. The loss sustained by Mr. Mayhew is said to be covered by insurance.

The Philadelphia Master Plumbers' Association has elected the following delegates to the National convention at Atlantic City, N. J., June 17 to 19: H. L. Righter, H. Smith, C. S. Warfield, J. McNally, E. Mackay, C. Groeling, S. W. Barnes, J. Gormley, W. Jones, W. McCoach, R. J. Hoben, S. Louis Barnes, W. S. Clark, L. J. Sommers, A. M. Hicks, G. Krouse, D. R. Burns, W. H. Doyle, William Harkness, D. D. Whealin, J. Harnett, H. Boon, R. H. Watson, F. P. Brown, H. Neilson, J. Dwyer, J. E. Eyanson, I. T. Hirst and D. Kennedy.

The announcement is made that the National Tube Company have decided that with the building of new tube mills by the United States Steel Corporation, probably at Neville Island and Lorain, Ohio, the company's Tube plant, at McKeesport, Pa., may be abandoned. The company had options on 25 acres of ground, on which they at one time proposed to build extensions, but it is said that the options have been returned and the project either postponed or relinquished.

Quartermaster Thomas H. Slavens, Fort Adams, R. I., will receive bids until June 4 for plumbing, heating and wiring a brick bath house at Fort Adams.

John F. Johnston, Fall River, Mass., has been awarded by the Board of Trustees of the Textile School, that city, the contract for heating and ventilating the school building, at his bid of $3837.

The directors of the City Hospital and Dispensary at York, Pa., have awarded the contract for heating and ventilating the new hospital annex to the Broomell, Schmidt & Steacy Company of that city.

Bids will be received until May 21 by the Board of Awards, Baltimore, Md., for a heating and ventilating system for a school building at Lakewood avenue and Orient street, that city.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until June 2, for the construction, including the plumbing and heating apparatus, electric wiring and conduits, of the Hygienic Laboratory of the United States Marine Hospital, at Washington, D. C.

T. D. Dempsey & Co., plumbing contractors, of Dubuque, Iowa, have removed their business into larger and more commodious quarters at Eighth and Locust streets, that city.

P. J. Moran of Salt Lake City, Utah, has been awarded the contract for the plumbing in the Emery apartment house in that city at his bid of $8000. Mr. Moran also secured the steam heating contract for the same building at $5492.

The New York office of the Kelsey Heating Company of Syracuse, N. Y., which has been for the past five years at 239 Water street, was moved on May 1 to more commodious quarters at 156 Fifth avenue. The change to this more central and accessible location was made for the benefit of those dealers who might want to send their customers to the office of the Kelsey Heating Company for inspection of their goods. L. V. Sanford, the New York manager, reports that he has never known a spring when he has been so busy, and that as the Kelsey Generator becomes better known, the demand increases at a very rapid rate.

Wilfred E. Mansur, Bangor, Maine, will receive sealed proposals until May 29 for plumbing the Penobscot County Court House.

Proposals for plumbing and heating a new school building at Conway, Mass., will be received until May 24 by A. O. Delabarre, Conway, Mass.

James Bannon, Providence, R. I., has been awarded the contract for plumbing and heating a new grammar school building at Warren, R. I.

A fire visited the plant of W. A. Chase & Co., Buffalo, N. Y., on Thursday, doing damage to the extent of $130,000, which is said to be covered by insurance. The company make and handle Engineers' and Plumbers' Supplies.

The City Council of Bucyrus, Ohio, have granted a franchise to J. W. and E. F. Gwynn for a hot water heating plant to be installed in that city. The plant will be run in connection with the local gas and electric light company. The price to the consumer is fixed at not over 20 cents per foot of radiation per year.

The Kewanee Boiler Company, Kewanee, Ill., announce that they have recently made some important improvements in their Tabasco Hot Water Heaters, and to meet the increasing demands of plumbers in the United States and Canada they have just put on the market an extra heavy Tabasco Heater. It is made of heavy plate, and the company guarantee every Heater tested to 150 pounds pressure before leaving the factory, safe for a working pressure of 100 pounds. The extra heavy Heaters are made in two sizes—viz., 200 and 300 gallon capacity per hour. A large stock of the extra heavy Heaters is carried and the immense stock of the Regular Tabasco Heaters and Storage Tanks in all sizes is still unbroken. A new and complete circular describing this line is now in the press, and the company will be glad to mail one, when ready, upon application. Something else new, of interest to the heating trade, is also in the printer's hands and announcement will be made in these columns subsequently.

The Advance Packing & Supply Company, manufacturers of Engineers' and Mill Supplies, Steam Pumps, Packings and Brass and Iron Goods, 55 South Canal street, Chicago, Ill., advise us that they have a continually increasing demand for their products, which has obliged them to make constant additions to their working force.

New Firms and Changes.

The Steamfitters' Supply Company, Chicago, Ill., were recently incorporated with a capital stock of $15,000, for the manufacture of Plumbers' Supplies. The incorporators are Bertrand Hayes, Richard Hayes and H. I. Shaw.

The Higham, Burton & Taylor Plumbing Company have been incorporated at Salt Lake City, Utah, with a capital stock of $10,000, divided into shares of the par value of $1 each. The officers of the company are John S. Higham, president; Elbert T. Burton, vice-president, and William S. Hughes, secretary and treasurer.

T. K. Conway has opened a plumbing shop at 93 Franklin avenue, Hartford, Conn.

The Central Heating Company of St. Paul, Minn., have been organized with a capital stock of $50,000. The incorporators of the company are J. P. Adamson, R. G. O'Malley and O. H. West.

The American Pipe & Foundry Company of Bessemer, Ala., have been incorporated with a capital stock of $100,000, by W. J. Long, T. Y. Hoffman and H. C. Mead. The company propose to make and sell Iron Pipe, Hydrants, Valves and other foundry work.

Charles Mayhew, who for nearly 50 years has conducted a plumbing, tinsmithing and house furnishing goods business at Edgartown, Mass., has sold his business to Thomas H. Chirgwin. Mr. Chirgwin has been engaged for some years past in the same line of business at Cottage City, Mass., and is well equipped to carry on the trade built up by his predecessor. It is understood that he will also continue his Cottage City shop.

The Pittsburgh Valve & Fitting Company of Pittsburgh, Pa., are being organized by M. J. Alexander and W. D. Hautupee of the Pittsburgh Plate Glass Company and others. A charter will shortly be applied for and ground has been secured for a manufacturing plant in Barberton, Ohio.

James Gray, Rensselaer, N. Y., advises us that he has disposed of his plumbing business to Fowler & Babcock, two young business men of that city. The new firm will be pleased to receive catalogues and price-lists from jobbers and manufacturers in their line.

Frank A. Heinlein has opened a plumbing establishment at 324 Washington street, Brighton, Mass.

The Standard Mfg. Company, Galesburg, Mich., manufacturers of Wind Mills, have been incorporated under the same name, with a capital stock of $200,000, for the purpose of extending their business.

Pleuger & Henger Mfg. Company, St. Louis, Mo., have added to their line California and Chicago patterns of hose valves, Siamese hose connections and compression sill cocks, which they are now making and are prepared to supply to the trade.

E. A. Allen, formerly of Old Town, Maine, has opened a plumbing shop at Millinocket, Maine.

Kneisser & Co., 916 Summit street, Toledo, Ohio, have recently put on the market a Cement for thoroughly sticking together greasy or dirty belts. No pegs, rivets or sewing is necessary, it is explained, when using the cement. It is prepared in a dry form for marketing, put up in 1, 2, 3 and 5 pound packages, and is also sold in bulk. It is alluded to as standing any climate, and as not being affected by heat, cold or dampness. The Cement has been used on belts from 2 inches up to 87 inches in width.

Church Ventilation.

Those who are called upon to heat and ventilate churches will be interested in the experience of St. John's Protestant Episcopal Church, Jersey City, N. J. The matter of church ventilation is not always so simple a problem as to make the solution easy. That it receives more attention than the congregation are oftentimes aware of can be learned by reading the following letter prepared by Rev. Dr. Stoddard, the rector of St. John's:

> St. John's is "not well constructed for good ventilation without a draft." When the people are once seated, it has been found impossible, except in mild weather, to have any windows open without an immediate complaint from the congregation. In former days when this was tried, 20 people have stayed after service to protest against it, and so they did a few Sundays ago when the rear doors were left open a little while. Years ago, therefore, the idea of opening windows above the heads of the congregation was given up and orders were made strict that, save in mild weather, this should not be done.
>
> But is the ventilation bad? We think, on the whole, not. Every Sunday without exception the rector is in the church at from 10 to 10.15 to personally look after this matter. The church is entirely thrown open until the people begin to assemble, so that by that time the whole air is perfectly fresh. The thermometer, by the time the people arrive, is never allowed to be over 62, and during the service is never allowed to rise above 65 degrees.
>
> With the air perfectly fresh at the beginning of the service, with a regulated thermometer, with a church as high as St. John's, 50 feet from floor to roof peak, and with a service only 1 hour and 15 minutes long, there should be very little inconvenience from foul air. The fact that many of the children go out before the sermon, opens the doors midway in the service, makes a current and brings relief.
>
> My answer to any complaints on the score of insufficient ventilation is that windows cannot be open in cold weather when the congregation is in the church: that there is the greatest care taken personally to have the church full of pure air when the people meet, to keep the thermometer down and to make the service short; also that there is almost no complaint about the air, and that as soon as it can be afforded the rector will advocate the adoption of some of the improved systems of ventilation, which, nevertheless, from his experience, is really not very much needed and perhaps never will be until the sermons are an hour long.

Facts About Lightning.

Many people admit, and more experience without admitting, fear of lightning. The feeling ranges all the way from vague uneasiness to frantic terror, and the aggregate amount of mental discomfort thus caused is very large. The *Electrical Review*, in noting the approach of the thunderstorm season, calls attention to the disproportion between the popular apprehension and the actual danger, but there is small consolation in that for the timid ones, all of whom know that the number of deaths from lightning is a negligible fraction in mortality reports, and still they are afraid. The *Review* disbelieves utterly in lightning rods; at least it says that, "as usually put up, they are of practically no use." A tin roof, with metallic spouts connected with underground pipes, it credits with some protective power, but for the dweller in the country no close approximation to safety is attainable. The urbanite, on the contrary, is in no measurable peril, even if he takes no precautions at all, for, though city buildings are often struck, in hardly any instance does serious harm follow. It is well to avoid trees during thunderstorms, and stables containing animals and barns filled with new hay are also to be shunned. It is important to know that people are rarely killed outright by lightning. Many who die from its effects would recover if resort were had to artificial respiration, long continued. The production of lightning is thus explained: "When clouds are formed by the condensation of very minute drops of water from the vapor in the air, under certain conditions these drops exhibit a small electrical charge. As the drops coalesce the capacity increases less rapidly than the quantity of charge, for the reason that two drops of equal size, when they flow together, produce one of only slightly larger diameter, and the capacity is determined by the diameter. On this account the drops formed by the flowing together of the small mist particles, long before they attain such size as to be precipitated as rain, acquire an electrical charge of enormous voltage, sufficient often to leap a distance of a mile through the air."

Seven Months of Extraordinary Activity.

It is now about seven months since the iron trade began to develop the extraordinary activity which has broken all records for volume of business. Prior to that time no indication had been shown of an approaching tidal wave of heavy buying. On the contrary, not a few of the most experienced members of the trade had formed the opinion that the crest of the wave of prosperity had passed, and that a gradually declining demand and a lowering of prices were to be expected. They were fortified in their opinion by a number of conditions which seemed to them conclusive. Prominent among them was the partial failure of the corn crop, the main reliance of a great section of the country. Again, important additions to the producing capacity of iron and steel works had been made during the summer and autumn of 1901, and it was a serious question whether a market could be found for the increased product without disturbing values. Further, European countries were suffering from the collapse of their commercial and industrial activities and European manufacturers had again become keen competitors for international trade, to the great detriment of our export business. We had grown to regard the export trade in iron and steel products as a permanency, and the prospect of its curtailment caused serious misgivings. We had also been educated to the export trade as a profit yielding adventure, owing to the protracted prevalence of higher prices abroad than at home, and the outlook in this direction was thus doubly disquieting.

But the unexpected happened. Instead of a heavily reduced movement of merchandise to the afflicted agricultural districts of the West, it was found that the people of even the worst drought-ridden sections were apparently as freely buying luxuries and necessities as though they had enjoyed a bountiful crop. Their accumulations in previous years of abundance easily enabled them to endure one season's failure. Railroads continued to report increased earnings in these as well as all other sections of the country. After the bogey of crop failure had been thus effectively driven off, it seems as though business interests generally must have acquired a fresh stock of courage. The demonstration of the substantiality of the prosperity of the country was certainly most convincing. From that time the demand for iron and steel products grew as it had never grown before. In an amazingly short period, it will be remembered, the fairly large stocks of pig iron disappeared. When new blast furnaces were blown in or idle stacks were started their product was so easily absorbed as to surprise the entire trade. Contracts for all kinds of materials were freely placed for delivery far into the future. All classes of consumers bought so freely and in such large volume that in every branch of the iron and steel trade manufacturing establishments oversold their capacity, and have ever since been in trouble with their customers because of unsatisfactory deliveries. Instead of the decline in the export trade depressing the market, we have been obliged to go abroad to purchase additional quantities of iron and steel. The whole development of these seven months has thus been most surprising.

The most extraordinary feature of this remarkable period, however, is the fact that notwithstanding the enormous volume of business, surpassing anything previously known, and the marvelous demand which at times caused decided scarcity, the usual accompaniment of a boom has been absent. Prices were maintained on a reasonable basis notwithstanding the temptation to advance them. On previous occasions of this character we have seen prices enhanced beyond all reason, even with less encouragement than that afforded during this period. It would have been an easy matter to have put the price of steel rails several dollars higher, as well as the prices of Bessemer pig iron, steel billets, structural steel and other iron and steel products. That prices have not been unduly advanced may be placed to the credit of the great manufacturing corporations, who have done everything in their power to maintain values at a reasonable level in order to continue to encourage consumption. A remarkable concert of movement obtained among these large manufacturers, even though engaged in dissimilar lines. The lessons of the past were borne in mind when it was determined that so far as they could prevent them no wild advances should be made which would inevitably be followed by a reduced consumption and a considerable slump in prices. We thus see that at the present time, although the producing resources of this country are so overtaxed that it is necessary to import considerable quantities of materials from abroad, the great business of the country is being conducted on the basis of reasonable prices. It is true that some consumers, and possibly a considerable percentage of them, have not been able to cover their requirements, and these are now compelled to pay premiums above the regular or official price to secure the early delivery of such materials as they require. Nevertheless, the large manufacturers continue to exert their utmost influence to supply the trade as far as possible and to prevent an undue expansion in price. It is certainly a most remarkable exhibition of restraint to see these manufacturers avoid the opportunity which might enable them to secure much greater profits.

Some speculation exists as to what the effect on the trade may be of a general revision of prices, which some think must be inevitable by the close of this year, after many contracts taken at comparatively low prices have expired. It is assumed that the price of foundry pig iron, for instance, may be advanced as much as 50 per cent. above the rate ruling on contracts running through the greater part of the current year. Those who take this view of the situation are inclined to the belief that such an advance in cost will greatly diminish the consumption of pig iron, as it will so seriously increase the cost of all articles into which pig iron enters. It remains to be seen, however, whether by that time the conditions which now exist may not be changed. It is almost inconceivable that the high pressure for materials should continue beyond the present year. It is more rational to suppose that by that time the high tide of business will have diminished to such an extent that our manufacturers will be able to take care of the consuming interests and that reasonable views with regard to prices can be maintained.—*The Iron Age.*

New Publication.

Dipping, Burnishing, Lacquering and Bronzing Brass Ware. By William Norman Brown. Publishers, D. Van Nostrand Company, New York, 1900. Price, $1.

The object of this practical little hand book is to reach the local gas fitter, decorator or general "hand man" of the metal trade, in small country towns, and to give him a few good practical hints, so that he may himself be able to do the work offered, and not be compelled to "send it up to London" every time.

Mr. Brown enumerates the articles necessary to constitute the outfit for doing the kind of work he describes, and has an eye to utility and first cost in what he advises. Having been for a considerable time in a London brass finishing shop, he speaks from personal experience. He speaks directly and plainly to the local artisan, much as a shop foreman might instruct his men. For that reason, probably, Mr. Brown does not supply his readers with definitions. This is, perhaps, to be regretted, because when the observations of a skilled worker take the permanent form of a published work it is likely to reach a wider circle of less technical readers than the author may first have anticipated.

Chapter I deals with cleaning and dipping into acid, and "pickle." Chapter II, scratch brushing, burnishing and polishing. Chapter III takes up the subject of lacquering, and enumerates the tools, describes the process, and gives the methods of making lacquers, for the benefit of those who cannot readily obtain them, or who prefer to make their own. In Chapter IV, under the head of bronzing, the process of applying and the composition of black bronzing, Florentine red bronzing and green bronzing are described. A small index is appended.

The book is eminently practical, and contains many useful shop "kinks." The reader may feel very certain that good work has actually been done in the way and with the materials described. The book is also published in London.

◆

Proposed Legislation for Ventilation.

A movement was begun at the meeting of the National Educational Association held at Detroit, Mich., last summer in the interest of school house sanitation, which has been supplemented by work done in Milwaukee, Wis. The association appointed a committee, consisting of one member from each State and Territory, in the United States, whose duty it was to frame a law which should specify the essentials of a sanitary school house in the matter of lighting, heating and ventilation.

William George Bruce of Milwaukee was selected to make the first draft of such a law and present it to the various members of the committee for modification and approval. After it has passed muster with the committee it will be submitted to the association for adoption. It is intended to introduce the measure in every Legislature of the United States for enactment.

Following is the text of the bill submitted to the committee:

AN ACT—Providing for the heating, lighting and ventilating of public school houses and fixing penalties for a violation of the provisions thereof.

Section 1. Be it enacted by the people of the State represented in the ....: It shall hereafter be unlawful to let any contract for or to construct any public school house, or other building, to be thereafter used for school purposes, the lighting, heating and ventilation of which is not in full accord with the provisions of this act.

Sec. 2. All public school buildings hereafter constructed or remodeled for school purposes must be lighted by windows placed in one rear or side wall of each class and study room, and such windows shall contain glass surface of not less than one-fifth of the floor space of each room; and all desks and seats shall be so arranged that the windows will be on the left, or in the rear, so far as possible, of the pupils.

Sec. 3. All class and study rooms shall contain not less than 15 feet of floor space and not less than 180 feet of air space for each pupil.

Sec. 4. All public school houses or school buildings of more than three rooms each, which shall hereafter be constructed or remodeled for school purposes, must be provided with such heating and ventilating apparatus as will facilitate the introduction of warm air, when occasion requires, into each class or study room, not less than 8 feet above the floor line, with provision for the exit of impure air at the floor line; and the whole shall be so arranged that the required temperature of 70 degrees can be maintained throughout each room even in the coldest weather, and the air changed in each room (combined average measured at inlet and exit openings) at least eight times in each hour, without lowering the temperature or creating a noticeable draft at or below the breathing line.

Sec. 5. All closets and urinals must be so constructed as to provide for the absolute seclusion of the pupil using the same. They must also be provided with vent flues, so arranged that all foul odors and air will be carried out below breathing line.

Sec. 6. Any contract for the construction or remodeling of any school building, not in conformity with the requirements of this act, shall be void; and any public school officer or contractor who shall violate the terms and conditions of this act by letting or accepting any contract for the construction or remodeling of any public school house or school building not in conformity with this act shall be deemed guilty of a misdemeanor, and shall be subject to a fine of not less than $200 nor more than $1000 for each offense.

◆

The strike of boiler makers, which has been on in Cleveland since January, is at an end, having been settled by arbitration through the good offices of Sheriff Barry of Cuyahoga County. The terms of settlement were: An advance of 15 cents per day; ten-hour work day; half holiday during June, July and August; time and a half for overtime on new work, and double time for overtime on old work. The agreement to continue until January 1.

Oil Fuel and Oil Burners.

BY EGBERT P. WATSON.

With the discovery of new oil fields in various parts of the world interest in the use of liquid fuel has been revived. Many large steamship lines have adopted it extensively and are establishing depots of supply in various ports. Texas oil can be had so cheaply at present that experimental trials have been made with it in lieu of coal by the United Fruit Company, running a line of vessels from New Orleans to the Belize. It was a first test, but proved entirely satisfactory from every point of view. Not only was the round trip the fastest ever made by the company's steamers, but it was also the cheapest. Six firemen were dispensed with and the actual consumption of oil was 850 barrels, as against 218 tons of coal for a similar service. The company are, it is reported, about to adopt oil fuel upon all of their vessels and set up tanks at both ends of the run to supply them. The saving annually is estimated at $9250 for each ship.

It is somewhat anomalous, in view of all the circumstances and previous experience with oil as fuel, that it has not been more generally adopted in years gone by. One reason has been the uncertain supply. Another is the high price of oil as compared with coal in certain places remote from mines. Still another is the unsatisfactory results obtained from oil fuel at different times, on one day giving no trouble and on others nothing could be done with it. This last is by no means unusual, but it is nearly always caused by water in the oil, either as it came from the well or getting into it subsequently. However this may be, oil fuel at present prices is likely to be extensively used, but in comparison with the quantity of coal in sight and known to exist it is still very doubtful whether it will become a formidable rival. Notwithstanding the views of "well-known scientists," whose names are not given, there is no positive knowledge of the extent of the new oil fields, and as soon as the supply is restricted the price will go up until coal will be the cheaper.

In any event, the oil reserve underlying this country will have to be of incredible extent in order to compete with coal for a long term of years. The consumption of the latter is enormous, so great that it would take a very large number of even 300-barrel daily spouters to appreciably lessen its consumption. The spouters aforesaid come into action at once upon striking the oil veins, and cease flowing as suddenly as they commenced, while coal mines continue prolific through decades. It would seem better to make haste slowly in deciding between coal and oil fuel, for although the supply of the latter is adequate to the present demand, it is more than doubtful if it would continue if there was a general call for it.

Many, if not most, of the difficulties and dissatisfaction with the results obtained by using oil as fuel arise from defective burners or from neglecting them. The popular idea of a burner is one that acts as promptly as a household lamp; but even this gives no light unless it is properly managed. If the wick is turned too high there is much smoke and no light, owing to an excess of oil. It is the same with oil burners designed to furnish heat instead of light, for the majority of them, or a large number, are run with a red-yellow flame. If the furnace is filled with this the burner is supposed to be doing its best, but there may be a sea of flame and comparatively little heat. A properly designed and managed burner affords a blue-purple flame and no smoke whatever, the oil vapor only being burned, as with the so-called wickless blue flame oil stoves in domestic use. There are a great many burners for fuel oil in the market, and those who are interested should take pains to see that they get a practicable one before condemning the fuel itself.

◆

Luther Brothers, Milwaukee, Wis., manufacturers of Gas and Gasoline Engines, Emery Grinding Machines, &c., have been incorporated under the name of the Luther Brothers Company, with a capital stock of $50,000. The officers are: S. S. Newton, president; G. M. Luther, vice-president, and C. J. Luther, secretary and treasurer.

THE LETTER BOX.

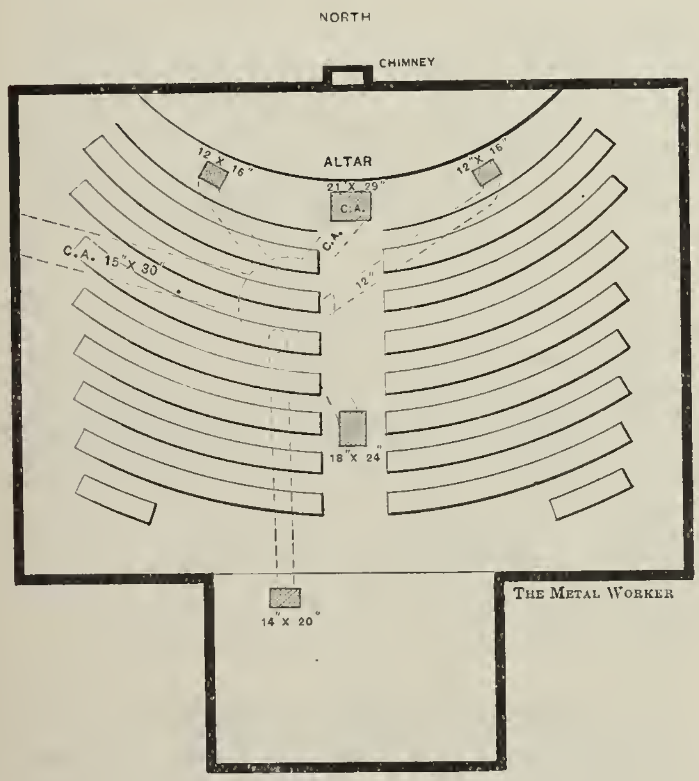
Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

SCANT AIR SUPPLY HINDERED HEATING.

From Nut Meg, Connecticut.—The church heating plan of "L. P. C.," Leipsic, Ohio, given in *The Metal Worker* of April 26, seems to me radically wrong, inasmuch as the whole system—smoke flue, furnace, hot air pipes and registers—is clustered in the south end of the church. I do not know the conditions of the cellar, but if all clear and the southeast corner, marked "Entrance," is the front, why, in the name of all that is holy, was not the smoke flue located on the north end or at the northwest or northeast, so as to accommodate the location of cold air, and the registers distributed in proper positions?

There is a church in the upper part of this State having a hot air system which consists of one 21 x 29 inch register in the center and over the furnace, and one register in each vestry 25 feet due north from the furnace. A 21 x 29 inch register for taking out cold air and creating a circulation is placed in front of the altar. There is also a cold air duct from the northeast corner and air is taken from outside, each being run independently when the conditions permit. Now this church is heated to perfection, and it is but a few feet larger than the one shown by "L. P. C." One advantage I had was the location of the smoke flue. The cellar also was clear. Another reason, I had a 29-inch fire pot furnace placed in the center of the cellar, and according to wishes of the authorities in the church was allowed only one register in the auditorium. The secret of the success was a furnace of sufficient capacity, ample cold air inlet and means for relieving the church of cold air early in the morning; also, the setting of the furnace a little northerly in the cellar. The registers in the vestries were 9 x 12 inches.



Scant Air Supply Hindered Heating.

The only remedy I see in "L. P. C.'s" case is to relocate the furnace more to the north. Place registers for warm and cold air as indicated in the accompanying sketch, and, instead of a 24-inch fire pot, let there be not less than a 29-inch fire pot in the furnace. The pipe in the Sunday school room would, of course, be a long one; but it has one advantage in running southerly. The 21 x 29 inch exhaust cold air register, of 406 square inches area, less fret work, is ample to collect and draw in from the church sufficient cold air to create a circulation. Then when the audience gathers it can be shut off and outside air taken. The total area of pipes, as indicated in the sketch I submit, is 635 square inches. The area of outside cold air supply is 450 square inches. In my opinion the above proportions are sufficient and would give satisfaction. As "L. P. C.'s" sketch shows a wide divergence from the correct principles of hot air heating by furnace, he can congratulate himself that it was some "other feller's" job and none of his fish. If "L. P. C." has the contract to renovate, let him alter and amend this job. A little change may be needed from the sketch I inclose owing to conditions.

JOB BELONGS TO SHEET METAL WORKERS.

From D. D. Hughes, Titusville, Pa.—In *The Metal Worker* of May 10 appears a communication from "F. T. P." of Dallas, Texas, relative to the putting up of steel ceilings. He asks whether the carpenter or the sheet metal worker would be the proper person to do this work. As a metal worker of over 50 years' experience in the trade, it is my opinion that the question never should have been brought up by the trades unions for settlement. It is too ridiculous for mechanics of common sense to discuss the matter as to which class—carpenters or sheet metal workers—belongs the right of putting up steel ceilings, sheet metal cornices, roofing and siding, &c. The writer is the senior partner of the sheet metal working firm of D. D. Hughes & Son. Our firm have in the past 12 or 15 years put up more steel ceilings of the Kinnear & Gager Company's make than any concern in Northwestern Pennsylvania have put up of all other makes of ceiling combined, and we have yet to learn when or where a carpenter or other mechanic, outside of the sheet metal worker, has ever laid claim to placing in position a steel ceiling, sheet metal cornice, siding or roofing, or any other kind of sheet metal work and made a satisfactory artistic or mechanical job of it.

The question raised seems more than strange and should not be entertained for a moment. Any person of common sense and a little good judgment must know that the sheet metal worker, while being the proper person to put up a steel ceiling, would not shine as a stair builder or carpenter and joiner, and *vice versa*. By way of illustration, we will suppose that, in putting up a steel ceiling, a carpenter has to cut a lot of deep panels to fit angles where it might be necessary to make changes in the plan or style of ceiling as made out at the factory. Then the carpenter is in a sorry plight and will have to seek a sheet metal worker if the work is to look neat when done. It is not to be supposed that the hammer, hatchet and saw of the carpenter can be used to as good advantage as the hammer, shears and soldering implements of the metal worker.

Again, many of the ornamental center pieces of metal ceilings are made from galvanized iron and zinc, and should any change be required to be made in them, the handiwork of the sheet metal worker would be necessary to make the work presentable and substantial. I have seen in my time a few cheap steel ceilings put up by carpenters and it was annoying to see how the work was done. The marks of the hammer and saw were plainly visible throughout the whole job. No, it is far from being the work of a carpenter to do the work of a practical sheet metal man, and the carpenter or decorator, so called, who tries to do this work is an interloper and is very apt to be a poor carpenter.

A word to the trades unions, in conclusion. Let men who have spent an honest apprenticeship at the trade work at it and do it alone. Do not try to make poor sheet metal workers out of carpenters. You will have no trouble placing a good carpenter. He knows his business and can always find work at his trade. If a person wants a neat fitting suit of clothes, the practical merchant tailor is the proper one to apply to and not the shoemaker.

STRENGTH OF GALVANIZED IRON.

From A. T., New York.—Kindly oblige a subscriber with a reply through the Letter Box to the following question: What pressure per square inch will galvanized iron from 28 to 20 gauge withstand?

Answer.—On the basis of a tensile strength of 40,000 pounds per square inch for galvanized sheet iron with the grain, No. 20 should have a tensile strength of 1276 pounds per inch in width, and No. 28 a tensile strength of 505 pounds, it being less than one-half the thickness of No. 20. Then the breaking strength of the longitudinal seams, if well riveted and soldered, cannot be trusted for more than 60 per cent. of the total strength, which for No. 20 will be 765 pounds, and for No. 28 303 pounds per inch in width. Then the resulting tensile strength per inch in width divided by one-half the diameter of the cylinder gives the breaking strain per square inch. The safe working pressure should be no more than one-quarter of its breaking strain. As an illustration, the safe working pressure in a cylinder 12 inches in diameter of No. 20 galvanized iron will be $\frac{762}{4} = \frac{191\frac{1}{2}}{6} = 32$ pounds per square inch.

No. 28 will be $\frac{303}{4} = \frac{75.7}{6} = 12\frac{1}{2}$ pounds per square inch.

All thicknesses between these numbers will bear working strains in proportion to their thickness in decimals of an inch.

COLD WATER FROM BOTH FAUCETS.

From G. B., Orange City, Ill.—In *The Metal Worker* of January 11 there is a communication from "I. D. H.," complaining of cold water coming from both faucets. I do not see how this could be otherwise, as the hot water pipe is connected to the cold supply from the street. Is this an actual mistake in the piping, or only an error in the drawing?

Answer.—Investigation based on the inquiry of this correspondent shows that an error was made in the preparation of the cut used, although a correct drawing was furnished to the engraver. The connections at the top of the boiler were transposed.

PROTECTION FROM BREATHING ACID FUMES

From X, Waynesboro, Pa.—Will some of your readers please inform me through the Letter Box where I can obtain a contrivance to put in a man's nostrils so that he can breathe air from a distance? In soldering galvanized iron with the use of acid there is a very disagreeable, unhealthy vapor arising therefrom, and I wish, if possible, to avoid the effects of inhaling this vapor.

BEADING GUTTERS

From the Universal Machine Company, Canton, Ohio.—In *The Metal Worker* of May 10 we notice the inquiry of "C. A. S.," Mankato, Minn., for a suitable method of making various sizes of beads on sheet metal work. In answer, we would say that he should have one of the Universal all steel beading machines, in long lengths, such as are used extensively by sheet metal workers all over the country.

LETTERING CANS.

From C. D., Marshalltown, Iowa.—We should like to find out some cheap, quick means of doing the lettering on cans, the lettering to be in two colors, either printed or stenciled on a painted surface.

HOW DO YOU CONNECT EXPANSION TANKS?

From J. T. W., Philadelphia, Pa.—Will the readers of *The Metal Worker* kindly give their ideas in regard to connecting an expansion tank with a hot water system? Is it best to use a one-pipe connection from the system, or a double connection, making a complete circulation to the tank? I should like to learn from practical men which method is the best and safest and best adapted to the heating of ordinary dwelling houses.

Manufactures in the State of New York.

The census returns for the State of New York for the year 1900 have just been issued by the Census Bureau, Washington. The reports show a capital of $1,651,210,220 invested in manufactures and mechanical industries in 78,658 establishments reported for the State of New York. This sum represents the value of land, buildings, machinery, tools and implements, and the live capital utilized, but it does not include the capital stock of any of the manufacturing corporations in the State. The total value of the products of these establishments for the year is returned at $2,175,726,000, to produce which involved an outlay of $82,075,648 for salaries of officers, clerks, &c.; of $408,855,000 for wages, $221,886,000 for miscellaneous expenses, including land, taxes, &c., and $1,143,791,000 for materials used, supplies, freight and fuel.

The value above given of the products of the manufacturing industries of the State, it is pointed out, is the gross value and not the net or true value. This gross value is found by adding together the value of the products of the separate establishments. But the finished product of one concern is often the raw material for another, in which case the former reappears in the latter, and thus the original cost of certain materials may be included several times in the gross value. The net or true value has been found under the present census by subtracting from the gross value the value of all materials produced in a partly manufactured form. In this way the duplications in the gross value are enabled to be eliminated. Thus the gross value of the manufactured products of New York State for 1900, as stated above, was $2,175,726,000, while the value of materials produced in a partly manufactured form was $850,428,000. The difference is $1,325,298,000, which is the net or true value of the products.

The increase in the amount of capital invested in the manufacturing industries of the State in 1900, as compared with 1890, amounts to about 40 per cent., and the increase in the value of products to over 27 per cent. The number of manufacturing establishments shows a growth of 19.5 per cent. for the decade. The total population of the State is given in 1890 as 7,263,110, an increase of 21.1 per cent. over 1890, while the average number of wage earners has grown from 752,066 in 1890 to 849,056 in 1900, or 12.9 per cent. This shows that about 15 per cent. of the total population of the State are employed in its manufacturing industries.

Pin Holes in Aluminum Castings.

A correspondent of the *Aluminum World*, who complains of being troubled by numberless small holes in his aluminum castings, in consequence of which, when the metal is polished, the holes drag and tear and give the surface an unsightly appearance, asks for a method of avoiding the difficulty, and is answered as follows by the journal referred to:

This is one of the most common difficulties with which the aluminum foundryman has to contend. It almost invariably happens to a more or less extent if copper is the hardening ingredient which is used with the aluminum and is caused by overheating the metal in the crucible. "Soaking" or allowing the metal to remain in the fire, even at a moderate temperature, will also do it. With the alloys in which zinc is used for the hardening ingredient the presence of pin holes is not so apt to occur, but unless the temperature of the melted metal is kept down as far as possible, it is likewise liable to occur with such alloys. In short, the cause of these pin holes is the overheating of the metal.

◆

The exports to the United States for the ten months ended April 30, 1902, aggregated in value $1,180,158,674, being a falling off of over $70,000,000, as compared with those for the corresponding period of the previous fiscal year. The imports, on the other hand, amounted to $734,517,725, showing a comparative increase of over $78,000,000. The balance of trade in favor of the United States for the period named was $435,640,949, or $148,675,063 less than for the same months of 1901.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin has advanced 1½c. a lb., with light demand.

Copper has fluctuated somewhat; demand is not heavy.

Pig Lead is dull and firm.

Spelter is rather firmer, but dull.

Antimony is unchanged.

Nickel is active and without change.

Aluminum is firm and in good demand.

Tin Plates are quiet, with prices unchanged.

Black Sheets continue in good demand, with prices strong.

Galvanized Sheets are not in quite such heavy demand, but are still active and firm.

Old Metals are quiet and rather weak.

Foundry Iron is very scarce, with prices high and little doing, by reason of scarcity.

Sheet Copper is in good demand, with prices firm.

Sheet Zinc is without change.

Hardware is moving in good volume and prices remain strong.

Wrought Iron Pipe has been advanced 10 per cent. by New York jobbers.

Cast Iron Soil Pipe and Fittings are expected to be advanced in price shortly.

Plumbers' Copper Goods have been marked up 10 per cent. in price.

Solder is 1c. a lb. higher on strength of Pig Tin.

Rivets have stiffened in price.

Wire Nails are firm and active.

Cut Nails are still somewhat scarce and prices firm.

Window Glass is firm at the advance, with light demand.

White Lead is more active and prices very firm.

Spirits Turpentine has advanced 2c. a gallon.

METAL MARKET.

New York, May 16, 1902.

Pig Tin.—Through continuance of the manipulations of the market, both here and abroad, prices of Pig Tin have advanced sharply. Business is, however, still light as to actual consumptive demand, most of the consumers being well supplied. The net advance for the week since our last report has been about 1½c. Jobbers now quote Straits Pig in small lots at 31c. to 32c. per lb., according to quantity. The market at the close was strong, with every appearance of still higher prices. The metal at the present time is thoroughly under the control of large interests, both here and abroad.

Copper.—A manipulating influence was also apparent in this metal. It is believed in the trade that a number of prominent parties, who are interested in the floating of a new Copper company, have endeavored to advance prices and have succeeded to some extent. A number of bullish reports have been floating about the market which have had some effect. A premium on Lake Copper prevailed during the week, but it is regarded in the trade as unwarranted by conditions and therefore not likely to prevail for any length of time. So far as the consumptive demand is concerned, the market was dull, but considerable speculative buying was reported. Lake Ingot in small lots is quoted by jobbers at 13c. to 13½c. per lb., and Casting Copper at 12¾c. to 13c. Exports thus far this month amount to about 5600 tons, showing a heavy falling off as compared with April, which was 4000 less than the month of March.

Sheet Copper.—The demand for Sheet Copper keeps up in good volume, and all the material that the mills are producing appears to be going into consumption. Prices remain firm on the basis of 18c. per lb. for Sheet Copper from store.

Pig Lead.—The market is without change. It is dull and uninteresting, but steady. American Pig in small lots is quoted at 4.45c. to 4½c. per lb. St. Louis advices indicate dullness in the Lead market at that center, with the movement of prices within narrow limits.

Spelter.—This metal is a shade firmer in price, but without any notable increase in the consumptive demand. Western brands in small lots rule at 4.65c. to 4.75c. per lb. St. Louis advices report that the consumptive demand for Spelter at that point is light, and the market in a dull condition with no change in prices.

Sheet Zinc.—The demand for Sheet Zinc is of fair proportions. Prices are unchanged at 6¾c. per lb. for 600-lb. cask lots and 7c. to 7¼c. for smaller quantities.

Antimony—Is unchanged. Hallett's in small parcels is quoted at 8⅝c. to 8¾c. per lb.; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—There is no change in the market for this metal. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues active, and prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates remains under the same conditions reported for some weeks past. New business is comparatively light, while the deliveries on old contracts continue heavy. The retail trade has picked up somewhat under improved weather conditions. Prices are without change. American Bessemer Coke Plates, IC, 14 x 20, in moderate sized lots delivered at New York and corresponding points, are quoted at $4.85 to $4.95 per box. A further advance of 1½ pence per box in the price of Welsh Plates was reported this week, making 13 shillings 7½ pence, f.o.b. Swansea.

Sheets.—The demand for Sheets continues in large volume, although it is, perhaps, hardly so urgent as it was some time ago. The mills, however, are comfortably filled with orders. It is said that some of the new independent mills are unable to furnish stock to fill the requirements of their customers at the present time, owing to their inability to obtain the raw material. Reasonably prompt deliveries of both Black and Galvanized Sheets can now be had from mills, however, and the stringency which prevailed some time back seems to have entirely disappeared. Jobbers' prices are firmly maintained. No. 27 One Pass Cold Rolled Soft Steel Sheets are selling at about 3.85c. to 3.90c., and No. 24 Galvanized at 4c. to 4.20c.

Chicago advices are as follows: Less demand has been experienced for Light Sheets, there being an absence of large sales and even less movement in jobbing lots. No. 27 Black Shets in small lots from store are quoted at 3.45c. to 3.55c. Galvanized Sheets are quoted at net prices, small lots from store ruling at 4.70c. to 4.75c. for No. 27.

Old Metals.—No change is noted in this market. Demand is on a light order and prices are not very strong. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb.	9¾c.
Light and Tinned Copper	per lb.	8¾c.
Heavy Brass	per lb.	8 c.
Light Brass	per lb.	6¼c.
Lead	per lb.	3⅝c.
Tea Lead	per lb.	3¼c.
Zinc	per lb.	2⅞c.
Pure Aluminum Sheet	per lb.	25 c.
Cast Aluminum	per lb.	20 c.
No. 1 Pewter	per lb.	16 c.
No. 2 Pewter	per lb.	8½c.
Tin Plate Scrap, per gross ton	....	to $5.00
Wrought Iron Scrap, per gross ton	$13.00	to 13.50
Heavy Cast Scrap, per gross ton	12.00	to 12.50
Stove Plate Scrap, per gross ton	8.50	to 9.00
Burnt Iron, per gross ton	7.00	to 7.25

M. S. Brooks & Sons, Chester, Conn., manufacturers of Bright Wire Goods, are building an addition to their plant, 64 x 30 feet, of wood, three stories high.

THE PIG IRON MARKET.

New York.—The scarcity of spot Pig Iron continues and large premiums are being paid. Quite a number of consumers are helping themselves with Scotch Pig Iron, which is being sold in small lots. We quote, for summer delivery, Northern Iron, at tidewater, No. 1 X, nominal, $21.50 to $22; No. 2 X, $19.75 to $20; No. 2 Plain, $19.25 to $19.50. Tennessee and Alabama brands are as follows: No. 1 Foundry, $20.50 to $21; No. 2 Foundry, $19 to $19.50; No. 3 Foundry, $18.25 to $18.50.

Chicago.—There has been an increased volume of business in Pig Iron during the week and the market has developed a steadier tone, prices being less unsettled and varying between relatively narrow limits. Sales have been mainly of Northern Iron and, as a rule, have been confined to small lots, from carloads to some hundreds of tons. In the aggregate the tonnage has been considerable, considering the difficulty in placing of contracts. Sales, however, for immediate delivery have been rare, the little Iron offering being held at prices which are practically prohibitive. Compared with those current a week ago there has been an advance of about $1 a ton on Northern Iron and 50c. to $1 on special makes of Southern Iron. We quote as follows:

Lake Superior Charcoal	$23.00	to	$24.00
Local Coke Foundry, No. 1	22.00	to	22.50
Local Coke Foundry, No. 2	21.00	to	21.50
Local Coke Foundry, No. 3	20.50	to	21.00
Local Scotch, No. 1	22.00	to	23.00
Ohio Strong Softeners, No. 1	24.00	to	24.50
Southern Silvery, according to Silicon	20.40	to	20.90
Southern Coke, No. 1	19.65	to	20.65
Southern Coke, No. 2	19.15	to	20.15
Southern Coke, No. 3	18.65	to	19.15
Southern Coke, No. 1 Soft	19.90	to	20.65
Southern Coke, No. 2 Soft	19.15	to	19.90

Philadelphia.—The scarcity of Iron for prompt delivery appears to be as great as at any time during the year. Relief has been expected by the arrival of foreign Iron. So far, however, the deliveries from that source have been very small and very much behind time. Where any Iron can be obtained for prompt delivery anything from $20.50 to $21 for No. 2 X, Foundry, and even higher than that, is paid. The scarcity of Iron for May and June shipment is very great and is not likely to be overcome for many weeks, and it may be two or three months. In a general way quotations are about as follows for Philadelphia and nearby points, with 50c. to 75c. additional for May, June and July shipments:

No. 1 X Foundry	$20.50	to	$21.50
No. 2 X Foundry	19.75	to	20.50
No. 2, Plain	19.25	to	19.75

Pittsburgh.—The scarcity of Pig Iron shows no relief and many of the foundries and other plants are running short handed for want of material. It is clear that in spite of our enormous production of Pig Iron the consumption is in excess of it. No. 2 Foundry Iron is selling at $20.75 to $21, Pittsburgh, with some sellers asking higher prices.

Cincinnati.—Word has finally been received that the $12 Birmingham agreement was rescinded and the association disbanded on May 1. It is believed that the leading Southern interests are already so well sold up as to be out of the market for the next three months, but it is understood that there is quite a little lot of unsold Iron among other furnaces for delivery after this month. This Iron has been put on the market and is selling on the basis of $16 to $16.50, Birmingham, for No. 2 Foundry Iron, for delivery beginning with July. Most of the furnaces are asking and getting $16.50 to $17 for the same grade of Iron for May and June delivery. It is thought that in about 90 days the deliveries will become pretty closely abreast of the demand. The situation at present is an exceedingly strong one. While Iron may go somewhat higher, the general feeling is that it is now somewhere near the limit of the advance. We quote f.o.b. Cincinnati, as follows:

Southern Coke, No. 1	$19.25	to	$19.75
Southern Coke, No. 2	18.75	to	19.25
Southern Coke, No. 3	18.25	to	18.75
Southern Coke, No. 4	17.75	to	18.75
Southern Coke, No. 1 Soft	19.25	to	19.75
Southern Coke, No. 2 Soft	18.75	to	19.25
Southern Coke, Gray Forge	17.75	to	18.75
Southern Coke, Mottled	17.75	to	18.75

St. Louis.—Very quiet conditions rule in the Pig Iron market, and while scattered sales are being made, the present demand is neither heavy nor urgent. For the limited amount of material that is available at this time, however, there is an active demand at good round figures. A considerable volume of buying is expected to come into the market to cover requirements for the last half of the year. The position of the furnaces to meet this demand is a topic much discussed in Iron circles. The following is about the range of prices for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$19.25	to	$19.50
Southern, No. 2 Foundry	18.50	to	18.75
Southern, No. 3 Foundry	18.00	to	18.25
Southern, No. 4 Foundry	17.50	to	17.75
No. 1 Soft	19.00	to	19.25
No. 2 Soft	18.50	to	18.75

CHICAGO REPORT.

Scrap Iron and Steel.—There have been freer offerings of Old Rails, and prices for such have declined, but other kinds of Scrap have been well maintained in sympathy with the strong market for Pig Iron, while Turnings have been advanced 50c. per ton. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.		
Country Wrought Scrap	$14.00	to	$14.50
Machinery Cast	....	to	13.00
Malleable Cast	12.00	to	12.50
Stove Plate (free from burnt)	10.00	to	10.50
Burnt Iron and Grate Bars	8.00	to	9.00
Sheet Iron and Hoops	8.00	to	9.00
Plow Steel	12.00	to	13.00
Breaking Stock	....	to	11.00
Old Boilers—whole (Iron)	9.50	to	10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00	to	12.50
Old Gas Pipe and Boiler Tubes	12.00	to	12.50
Cast Borings	8.50	to	9.00
Turnings	12.00	to	12.50
Horseshoes	14.00	to	14.50

Old Metals.—A little firmer tone has prevailed for Copper, and other kinds of Old Material have been well sustained with a fair volume of business. Following are the prices paid by dealers in this market:

	Per lb.
Copper Wire and Heavy	10½c.
Copper Bottoms	9⅝c.
Copper Clips	10½c.
Red Brass	11 c.
Yellow Brass	8¼c.
Red Brass Borings	9¾c.
Yellow Brass Borings	7¼c.
Light Brass	6½c.
Pipe Lead	3.70c.
Tea Lead	3.35c.
Zinc	3 c.
Tin Foil	21 c.
Pewter, No. 1	17½c.
Pewter, No. 2	10 c.
Aluminum	20 c.

Old Rubber.—A firmer tone has been developed, and Old Rubber Shoes are higher, with less free offerings and a good demand. White Rubber is also stronger, and prices ¼c. higher. Other articles are unchanged:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7.10c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6 c.
Black Rubber	....	4 c.
White Rubber	....	8½c.

Rags.—The market has remained slow and easy with liberal offerings and only a moderate demand. Rags, Chicago delivery, 70c. to 75c. per 100 lbs.

Anthracite Coal.—Since the advent of the strike of the operators in the coal fields no new orders have been accepted for Anthracite Coal here; everything at the moment being held in abeyance, dependent upon the action to be taken by the workers. Under the circumstances, prices are entirely nominal. The following is the schedule of prices in force for all shipments to be made in the month of May, subject to a discount of 40c. Should work be resumed another advance of 10c. per ton will become operative on June 1, when the discount will be 30c. per ton.

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

Thomas J. Creighton has opened a Brass foundry on Chase street, Fall River, Mass. Mr. Creighton has been connected for 30 years with the Fall River Machine Company.

THE HARDWARE TRADE.

The past week has witnessed a continuance of the excellent trade which has prevailed since the opening of the season. Retail merchants report business as active, although the attention farmers are giving outdoor work interferes somewhat with the current trade. As a rule, however, they are enjoying such a measure of prosperity as justifies them in purchasing rather more liberally than usual. The activity in building, too, has a stimulating effect on business. Practically all mechanics are fully employed and at good wages. The Hardware market has not been affected by any important changes in price since our last report, but is characterized by a firm tone with something of a tendency toward higher prices. Almost every day the representatives of jobbing houses, who are in correspondence with manufacturers, find that there is a stiffening in the price of some line or article, not usually in the way of open and general advances, but rather in the withdrawal of some special discount or concession which has previously been in force. There is a good deal of difficulty in obtaining season goods, and those who have not covered their requirements are likely to be short of the articles when the demand sets in. In a great many other lines, too, manufacturers are behind their orders and the merchants are obliged to hurry up shipments of goods. Export business feels, perhaps, a little more than it has the effect of the great activity which prevails in the home market, as some manufacturers are disposed to neglect their foreign business. Others, and undoubtedly the greater number and the wiser, are taking care of their customers abroad and endeavoring to extend still further their export trade.

NOTES ON PRICES.

Wrought Iron Pipe.—The jobbers of steam goods in the metropolitan district have announced under date of May 16 an advance of 10 per cent. on the prices of Wrought Iron Pipe on all orders filled from New York stock. There has been no advance whatever in the price of goods shipped from the mills. It is said that the scarcity of Pipe has become more marked within the past few weeks and that comparatively few of the jobbers have excessive quantities of Pipe on hand. Owing to this condition of affairs the steam jobbers determined to take advantage of the situation and make the consumer pay for whatever material he needs for prompt shipment from New York stock. It is also understood that there will be an advance within a short time in the price of Cast Iron Steam Fittings and Steam Goods of all kinds. Continued and increasing scarcity of all lines of goods made from iron and steel is said to be the chief element prompting these advances.

Plumbers' Copper Work.—An advance of 10 per cent. has been made in Plumbers' Copper Goods. This advance affects Copper Boilers, Copper Sinks, Copper Lined Tanks and all goods in which irregular or special sized sheets of Copper are used in the manufacture. There has been no change whatever in the price of regular Sheet Copper, but special Copper Sheets have been advanced. The manufacturers of the goods above mentioned have each their particular size and weight, and as their stock is ordered in limited quantities and is not considered of a "regular" nature, they find considerable difficulty in getting their wants promptly attended to by the makers.

Cast Iron Soil Pipe and Fittings.—Despite the fact that at a meeting, which was held about two weeks ago, the manufacturers of Cast Iron Soil Pipe and Fittings decided to make no change in the prices of these goods, it is now announced that they are about to issue new prices, which will show a slight advance over the prices which now prevail. It is said that the deliveries of Pig Iron are not coming up to the requirements of the foundrymen and that unless relief comes immediately, the trade will suffer considerable hardship in procuring their supplies. The jobbing trade expect an advance at any time, and the retailers need not be surprised if the jobbers announce the change prior to that made by the manufacturers. We understand that such a change is now under advisement.

Solder.—The further sharp advance made this week in Pig Tin has been accompanied by higher prices in Solder. Jobbers now quote Half and Half, guaranteed, in small lots, at 20 to 20½ cents per lb., and No. 1 at 17½ to 19 cents.

Rivets.—Some of the manufacturers of Rivets have recently been withdrawing some of their extremely low quotations, and as a result the market is more even and has a somewhat better tone than heretofore. The demand is active.

Cast Iron Goods.—In view of the condition of the market for the raw material the prices of Cast Iron Goods are, as a rule, decidedly firm, and on some lines, such as Grindstone Fixtures, Well Wheels and Stebbins' Molasses Gates, higher prices have recently been announced.

Washers.—The demand for Washers is heavy and prices are firmly maintained, as a consequence, it is said, of agreement among the manufacturers of these goods.

Wire Nails.—An active demand continues for Wire Nails, and there is a noticeable improvement in the promptness with which mills are making shipments. In New York the local stocks are becoming better assorted. Prices are well adhered to, small lots from store being quoted at $2.30 per keg.

Cut Nails.—There continues to be some difficulty in getting shipments of Cut Nails from mill as promptly as the trade requires. The demand is of good proportions, and the market is firm. Small lots of Cut Nails from store, New York, continue at $2.30 per keg.

Window Glass.—The demand for Glass in the New York market is light. Prices are firm, Window Glass of single and double strength from store being quoted by jobbers at 89 per cent. discount.

White Lead.—A considerable quantity of White Lead in Oil is going into consumption daily. Trade is referred to as being more active than for some time past. Quotations are firm and unchanged. White Lead in Oil in retail quantities is selling at 6½ to 6¾ cents per pound.

Spirits Turpentine.—The local market for Turpentine has a stronger tone than last week, resulting from Southern advices of light receipts and large buying by export houses. The demand here is light with a firm market. Jobbers' prices rule about 2 cents higher, at 48 to 48½ cents per gallon.

Experiments With Acetylene.

Experiments to determine the liability of liquids and compressed acetylene to explode were tried recently at Berlin, Germany, says the *Scientific American*. Several cylinders loaded with 4 kilos of liquid acetylene were placed in position with a valve at the top. The gas which collected at the upper part of the cylinders was under a pressure of 725 pounds per square inch. A cartridge containing 1 kilo of picric acid was then applied and exploded by electricity, with the result of blowing off the top of the cylinder, but the acetylene was not detonated, and the cylinder emptied itself on the gaseous acetylene. Another cylinder was charged with 3½ kilos of liquid and a 200 gram cartridge placed in the bottom; when the electric current passed through into it the liquid acetylene exploded, destroying the cylinder. A cylinder of liquid acetylene was fired at with a rifle without explosion resulting. neither was a cylinder of acetylene disturbed by the explosion of a quantity of picric acid close to it. The experiments proved that acetylene is undisturbed by sympathetic discharges, but that the liquid will explode always if a detonator is in contact with it.

THE MAX AMS MACHINE COMPANY, 372 Greenwich street, New York City, have been incorporated with a capital stock of $220,000. The company recently erected a shop at Hoboken, N. J., for the manufacture of Canning Machinery. The incorporators are Max Ams, Charles Ams and Julius Brenzinger.

Gas Asphyxiation,

The treatment of cases of "gassing," as our British brethren term it, where workmen are rendered unconscious by breathing atmosphere charged with gases which are not life sustaining, is rather vague in the minds of many superintendents, and it has occurred to us that the rules covering such cases might be of interest to our readers. Inert gases do not produce such serious results as carbonic oxide, which has a decidedly toxic effect, paralyzing the red blood corpuscles, or sulphurous and cyanogen gases. The former class can be cured by the following rules, while the latter can be relieved until hospital treatment is available. These rules were compiled in 1896 by the *Chemical Trade Journal* of Manchester, England, a journal devoted to manufacturing chemistry:

RULES FOR DEALING WITH DANGEROUS GASES.

GENERAL REGULATIONS.

No person must enter any boiler or tank which has been recently used for the storage of any poisonous liquid or gas, or enter any dangerous workings, drain, sewer, culvert, gas purifier, flue, vitriol chamber or tower (whether closed or open), except under the following conditions:

1. A respirator properly charged and in good condition must be worn. If the gases cannot be absorbed a safety pipe and face piece supplied with air or oxygen must be substituted, according to the manager's instructions.
2. The person entering must be efficiently secured around the waist by a rope, the opposite end of which must be securely fastened to the ground at the surface or at the top of the tower or flue, &c.
3. A man must be in attendance and ready to render assistance if necessary. For underground work and in difficult positions two men must always be at the surface ready to assist.

HOW TO TREAT WHEN GASSED.

Remove as speedily as possible into the open air and place in a well ventilated position near the boiler, so as to keep as warm as possible.

In bad cases use the oxygen bottle and lung exercise simultaneously from the outset.

USE OF OXYGEN BOTTLE.

The bottle must never be used without a reducing valve.

If Conscious.—Very slightly turn on the valve so that the oxygen flows in a gentle stream. Place the glass tube in the mouth and let the oxygen be breathed until relief is obtained.

If Unconscious.—Place the oxygen delivery tube in one corner of the mouth, closing the lips around it. Keep the oxygen flowing in a gentle, continuous stream, alternately closing and opening the nostrils to inflate and deflate the lungs. (Gently pressing the chest when the nostrils are open assists the deflation.)

If the Teeth are Set.—Close the lips, insert the oxygen tube in one nostril, and alternately close and open the other in the manner just described. The complete inflation of the lungs is indicated by the blowing out of the cheeks. Carefully avoid too great a pressure in the lungs.

LUNG EXERCISE.

This is not often necessary, but if the oxygen does not act within a reasonable time use the following additional help to respiration: Lay the body at full length, face upward, slightly raising the shoulders with a folded coat, the head falling well back. Loosen the clothing around the neck and chest. Grasp the arms above the wrist and steadily draw them straight out above the head, holding them there for two seconds. Then turn the arms down, bending the elbows and at the same time pressing them firmly against the sides of the chest, and hold them in that position for two seconds. Continue this treatment about 15 times a minute for 20 minutes without cessation, or until consciousness is restored.

TRADE NOTES.

The Federal Mfg. Company, with main office at 419 Market street, Camden, N. J., have been incorporated with a capital stock of $300,000 by Nicholas H. Wagner, Samuel Hawkins and George H. B. Martin, to manufacture Cream Separators.

The Syracuse Heater, made by the Syracuse Heater Company, Syracuse, N. Y., forms the subject of an advertisement on another page of this issue. This Heater is described as a "Twentieth Century Surprise," and as the only full flue base Heater on the market.

In consequence of the death in April of N. M. Beach, former treasurer and general manager of the Bridgeport Brass Company, J. F. Kingsbury, Jr., who was secretary, has been made treasurer of the company, and W. F. Malloy, for some years manager of the New York branch, has been chosen secretary to fill the vacancy made by Mr. Kingsbury's advancement. Mr. Malloy will continue in charge of the business at 19 Murray street, New York.

FOR SALE.

A valuable manufacturing property, situated at 23d and Smallman Streets, Pittsburg, Pa. Remarkably well located as to shipping facilities, consisting of new steel constructed building 118 x 154 feet, thoroughly equipped with suitable machinery and tools for working in sheet metals. This establishment has a long ground lease, on very favorable terms and a large trade that will naturally follow it. It is the only concern in the Pittsburg district, with all machinery, for making corrugated conductor pipe, eaves trough, ridge roll, etc. This is an opportunity to secure a bargain for one desiring a business, that can be operated at once. Any one caring to investigate, with object of buying the building, machinery, etc., or any practical party, with capital caring to take an interest in the business, please address

H. L. IRWIN, Receiver for
Marlin & Co., Inc.,
Pittsburg, Pa.

For Sale.

Owing to having other interests in the manufacturing line, will sell Hardware, Stove, Furnace, Mantle and Jobbing business, at a very reasonable price and on very reasonable terms. Installed 83 furnaces last season and 55 Mantles.

TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES
= By H. K. VosBurgh =
NEW AND IMPROVED EDITION

A USEFUL handbook for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion $1.00

Section 1 — Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 — Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 — Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

Cloth Bound, $1.00 Postpaid

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price **$2.00.**

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Another Plain Talk About Metal Ceilings.

VARIETY OF DESIGNS.

The same design won't suit everybody.

Hence, the necessity of a variety to choose from.

The greater the variety you can offer, the better your chance of getting the business.

That's one reason it is to your advantage to handle our line; we have the largest and most complete assortment obtainable.

We furnish artistic Classified Designs in Greek, Roman or Romanesque; Gothic or Moorish; German, French or Italian Renaissance; Rococo, Empire or Colonial.

In each of these Classified Designs, an almost endless variety of combinations and effects can be secured.

We also have Miscellaneous Designs to select from.

With our line you can meet the requirements of all kinds of people and for all kinds of rooms.

If one design or combination does not suit your customer you have plenty of others to fall back on.

No competing firm can furnish you anywhere near the number or variety of patterns to select from that we can.

SPECIALTIES:
Ceilings, Roofing, Siding, Eave Trough, Conductor, Hangers, Etc.

Ceilings.
An Argument.

When accepting the agency for a line of ceilings, remember that time means money to you, and if it takes twice as long as necessary to erect a cheap metal ceiling because of faulty construction, what matters a few cents difference in the original price? You depend on making your profits by the time it takes to put the ceiling in place. Get

"CANTON" CEILINGS

METAL CANTON CEILINGS

and you have a winner. They are artistic in design and are easy to apply because all parts match perfectly, alignment is straight and regular and joints are tight fitting, requiring no putty to close cracks, which will mean a saving to you of 50 per cent. in labor.

Let us demonstrate what we say. Give us a trial order and others will follow.

Complete assortment of classified designs.

If interested, our mammoth catalog is yours for a postal.

JOSEPH DIXON CRUCIBLE COMPANY, - Jersey City, N. J.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
1. MITER CUTTING.
2. FLARING WORK.
3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

THE ELECTRIC CITY GUTTER FORMER
THE DOUBLE TRUSS CORNICE BRAKE CO.

New in Principle.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical, Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

"Satisfaction Garland, Jr."

SIX-HOLE STEEL RANGE. **FOR SOFT COAL OR WO**

The Most Desirable Range on the Market at Popular Prices.

Full-sized cabinet construction. This Range is durable in all parts which are su to wear and excessive use. Its general construction is the best, and it is most econo in the use of fuel.

The new PORTABLE reservoir—which has flush top, is made of cold-rolled ye metal and fits all sizes—admits of a Range being changed in a moment from SQU to RESERVOIR construction, there being no bolts to put in or remove. There are no around to fill up or clean. Reservoir holds 10 gallons of water and heats FASTER any other construction. The heat of the oven is not affected by the reservoir, and Range is ready for baking at all times.

Mounted with Wellsville Polished Steel, has square steel oven with bottom brac prevent warping, and is a very quick and perfect baker. The oven-top is protected cast-iron plate; the oven racks, the back of oven and inside of oven door, as well a inside of all flues, are ALUMINIZED, producing a bright surface, always clean, and vents rusting. Folding Teapot-Holders on high shelf and high closet. All parts which subjected to intense heat are protected with ASBESTOS, which not only protects all of the sheet steel but produces a UNIFORM temperature of heat.

This Range has end combination feed or broiling door, as well as end draft regist poking door. VENTILATED oven, effective ash-guards, large steel ash-pan, large cleaning door, end shelf on square Range, rapid-heating water-back. Very attra high shelf and high closet, all made of Wellsville Polished Steel, same as body of Ra nickeled trimmings. A three-ring cover sent free with each Range.

Made for hard coal or wood under the name of "SENSATION GARLAND," whi the same in appearance and general construction, only the fire-box being changed to duce the best results from hard coal.

Dealers desiring to lead the market should order sample of this Range at once so t may examine it carefully and place their order early to secure their supply, as we pre a very large sale for the "Satisfaction Garland, Jr."

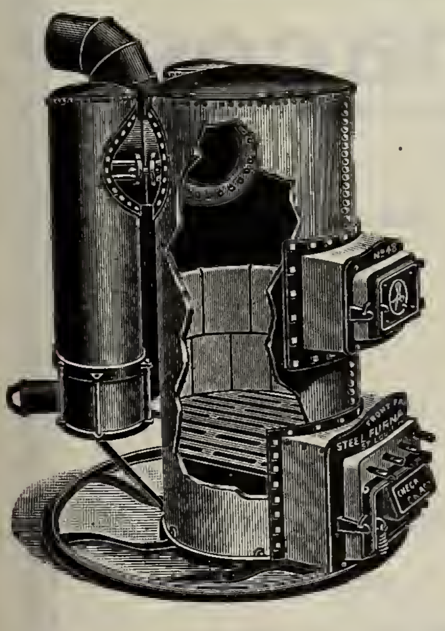
The Robinson Tubular Warm Air Furnaces

give universal satisfaction wherever used.

They are up-to-date in every respect and have many special features not found in other furnaces.

WRITE FOR CATALOG.

ROBINSON FURNACE CO., Chicago.



Front Rank Hot Air Furnaces

are built on vertical lines; air comes in direct contact with entire heating surface.

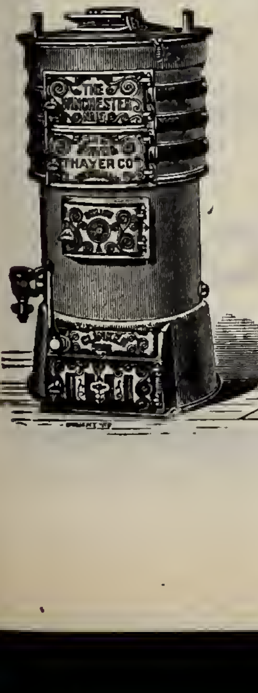
The Front Rank Fire Chamber is one solid sheet of closely riveted steel; being lined above the fire lines with genuine fire clay tiling it is the most durable made.

The radiators are very large and have an unusual area of heating surface in comparison with the size of fire pot.

These furnaces burn hard or soft coal or coke. We also make wood burning furnaces.

Send for our catalogue, it will give you a better idea of what we make.

FRONT RANK STEEL FURNACE CO.,
2301 to 2309 Lucas Ave., St. Louis, Mo.



WINCHESTER

Good company makes the way seem shorter. To the steamfitter it is a pleasure to travel in company with a "WINCHESTER" heater. His steam or water jobs are places it is a pleasure to visit, and they lead to more business. The "WINCHESTER" is for sale by Smith & Thayer Company, Boston, Mass.; 106 Beekman Street, New York.

HEATER.

OUR POSITION

The familiar story about the shield at the roadside and the two knights errant approaching it from opposite sides and exclaiming, the one: "It is silver!" and the other: "It is gold!" reminds one of Heating Apparatus.

We Manufacture

Hot Water Heaters,

Low Pressure Steam Boilers,

Warm Air Furnaces.

The advocates of each line swear by its merits. Perhaps, like the knights of the story, they are right.

Like a man who fixed a place for his neighbor's hens to lay, we enter no protest.

We manufacture all kinds of heating apparatus and we are in a *POSITION* to supply you with the most comprehensive line of each kind in the world.

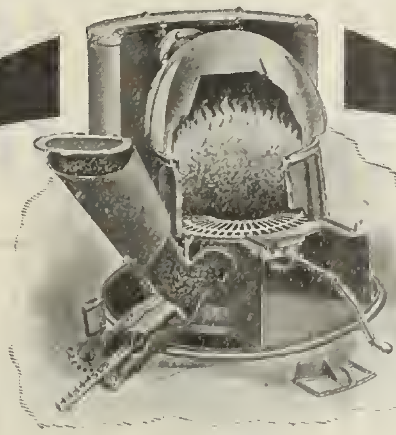
PITTSBURG, 210 Ferguson Bldg.
CHICAGO, Chicago Heater & Supply Co.
ST. LOUIS, Rumsey & Sikemeier.



PATENTED.

There is a point about the

Peck-Williamson Underfeed Furnace

which your customer will appreciate all the way through. It is the eliminating of smoke and gases and dust which usually attend the "firing up time" of the ordinary furnace. Sometimes this nuisance is very noticeable—even visible. Sometimes it isn't. But it is there just the same dirtying up the whole house.

In the **Peck-Williamson Underfeed Furnace** a pull or two on the lever forces the new coal up to the fire.

As the new coal ignites its volatile gases and free carbon are drawn up through the upper burning coal and thoroughly consumed. There is no other outlet.

This is the very simple and logical reason why the **Peck-Williamson Underfeed Furnace** is a clean furnace, and why it is practically smokeless, and why it utilizes every bit of the heat in the coal.

If you should tell a prospective buyer these things, what effect would they have? He is after the furnace that he believes will consume the least coal and give the most heat.

You can show him as clearly as two and two are four that the **Peck-Williamson Underfeed Furnace** will do things no other furnace on earth is able to do. They are the very things every furnace buyer is after.

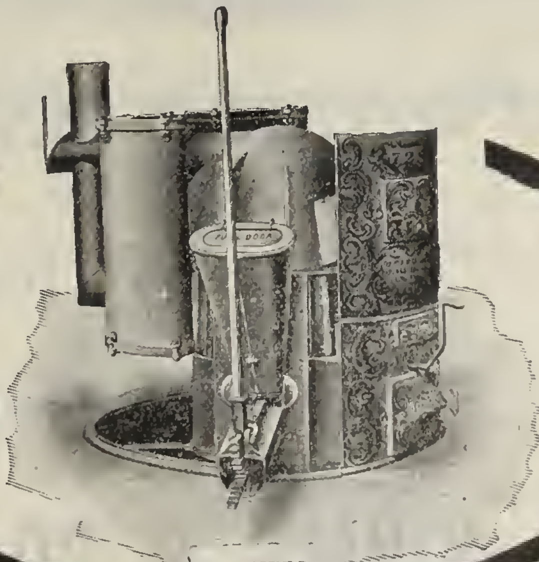
If you sell just one of these furnaces, it will open the way for you to usurp the furnace trade of your community.

There are some trite truths in our new booklet, which you may have for the mere asking.

Our Laundry Dryer is a household necessity. Drys clothes sun or storm in 20 minutes. The women want them.

The Peck-Williamson Company,

Cincinnati, = = = = = = = Ohio.



PATENTED

HIGH GRADE HEATERS

Some Dealers Look to the profit they make on the sale of a single furnace, and if a cheap furnace is used the profit looks large when the contract

Is Made

When this cheap furnace fails to heat, and gives out in the middle of winter, the dealer is obliged to alter and readjust the setting, secure repairs for his furnace, and in the end the entire profit

Is Wiped Out

and great disgust follows to both the purchaser and the dealer.

OTHER DEALERS INSIST

on using

Good MATERIALS
WORKMANSHIP
FURNACES.

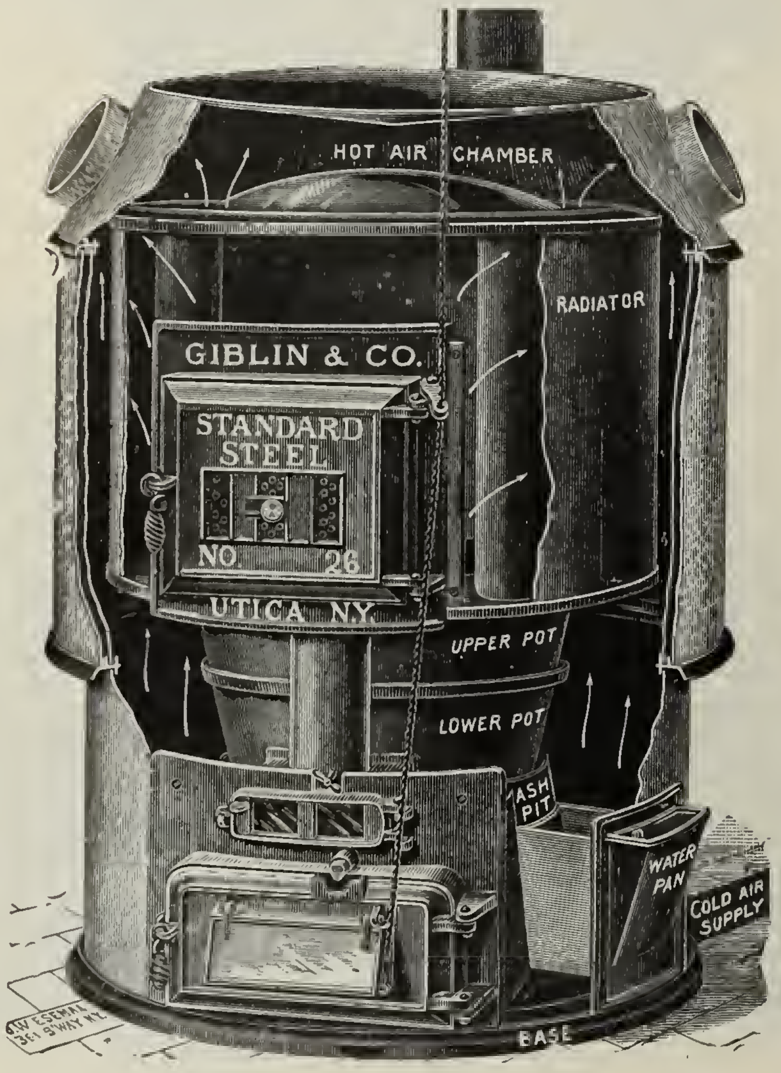
The result of such choice is satisfactory heating, pleasant feelings between the purchaser and the dealer, and the

WARMEST RECOMMENDATION

of the furnace and the dealer.

A GOOD BUSINESS REPUTATION

is obtained, and when good work is wanted this dealer is sought out and fair prices paid for his work.



The Basis

of all heating is a

Good Furnace,

one that is
SIMPLE in operation,
ECONOMICAL in fuel
and
LONG-LIVED
without the need of repairs.

The furnace shown here has all these merits, and the actual use of

Many Thousands

of these heaters has demonstrated its superiority.

FURNACE DEALERS

who are trying to establish a

Good Furnace Business

should place themselves in communication with us, obtain our catalogue, see the line of heaters we make and get in position to do business on a good basis for the balance of the year 1902.

Our Prices are reasonable, and our treatment of our customers is

More Reasonable.

The Financial Argument.

Some of the heaters on the market are not worth their price because better value can be secured for the same money. That's the great argument in behalf of

"GURNEY" HEATERS,

BRIGHT IDEA DORIC and 400 SERIES.

They furnish decidedly greater value yet they cost no more than ordinary heaters. Not only do we say so but a host of testimonials from present users corroborate this statement.

That one fact alone ought to be sufficient to induce every dealer who wants the fullest measure of business to handle "Gurney's." If you are in that class we shall expect to hear from you relative to an agency. Latest trade catalogue for the asking.

AMERICAN RADIATOR COMPANY

Lake and Dearborn Streets,
Chicago, U. S. A.

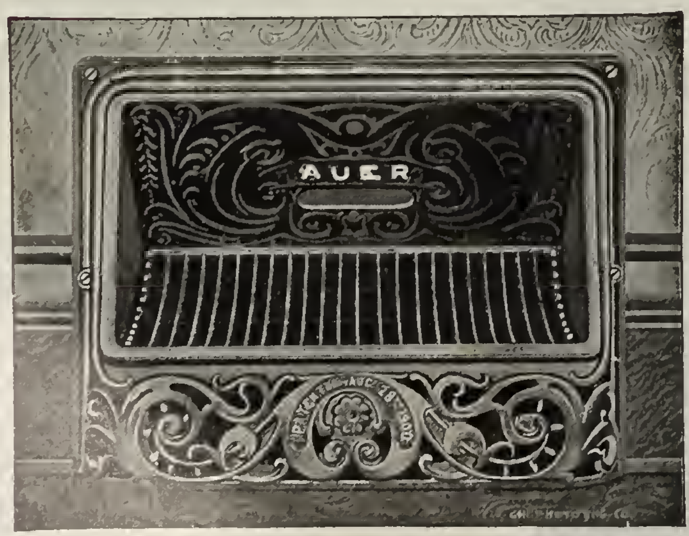
New York. Philadelphia. Buffalo. St. Louis. Minneapolis. Denver.

Have You

SEEN THE

AUER SIDE WALL Register

AND VENTILATOR?



When the Register is Open the Door Reflects the Air Across the Room.

If Not

YOU SHOULD IF YOU ARE A WIDE AWAKE, LIVE, UP-TO-DATE FURNACEMAN LOOK INTO IT AT ONCE. IT

HAS THE cheerful appearance of a grate or open fire place. No soiled walls. Ventilation and safety against fire are assured through the ventilator near the floor.

FOUL AIR is taken out instead of musty cellar air into the rooms.

NO KNOBS or sharp corners projecting into the room.

NO GRILLE WORK to obstruct the air exit and accumulate dust.

THE MERITS OF THE AUER REGISTER are acknowledged by so many new concerns attempting to imitate it, which also proves that the old floor register is undesirable and out of date.

THE AUER REGISTER has been tested and used for years, therefore not an experiment.

THE AUER REGISTER has no knobs or sharp corners projecting (as is the case with others) to endanger the life or disfigurement of children.

THE AUER REGISTER has no grille front suggestive of prison bars, obstructing the air exit, accumulating dust and making the register impractical as a foot warmer, which is the case with all others.

No Cutting Carpets. No Soiled Walls.

No Floor Register to Walk Over and Catch Sweepings.

VENTILATION and safety against fire is assured through the VENTILATOR near the floor. Foul air is taken out instead of musty cellar air into the rooms.

HOT AIR.

THE YANKEE EXCELS.

Above All—Cheapness—a dealer cannot possibly make dampers as cheaply as we sell the Yankee. Easily put in and taken out of pipes. Stiffest, quickest-working and neatest damper on the market.

It is impossible for this rod when in position to move either way.

ROD POINTS: Has wood enameled handle. Wood handle cannot come off. Washer and spring cannot fall off the rod. Same size of holes are punched on each side of pipe. Rod is made of ¼ in. cold-rolled steel and slips into damper very smoothly. **Sample sent to any Dealer without charge.**

A NEW AND ENLARGED EDITION.

KITCHEN BOILER CONNECTIONS.

A SELECTION OF PRACTICAL LETTERS AND ARTICLES RELATING TO WATER BACKS AND RANGE BOILERS.

The attention of readers of THE METAL WORKER is directed to the *fifth and enlarged edition* of Kitchen Boiler Connections, just published. Four editions of this practical book have been sold, giving apparently universal satisfaction, but with a view to presenting a more thorough treatise on the subject, and to enhance the value of the book to the Plumber, Architect and Mechanic, we have incorporated with this edition about sixty-five pages of new matter, together with over forty additional illustrations.

These additions cover many important phases of the subject not discussed in the earlier editions, giving practical solutions of numerous other problems often met with.

The new contents include among other important subjects:

In Chapter I. Kitchen Boiler Below Range.
" VI. Water Hammer in Boiler Connections.
" VIII. Proper Connection for a Horizontal Boiler.
" VIII. Double Water Back Instead of Double Boiler.
In Chapter VIII. Two Horizontal Boilers Connected with One Water Back.
" IX. Supplying Hot Water in Large Buildings.
" X. Lime Deposit.
" XII. Hot Water Supply and Heating a Barn.

Examples from actual practice only and which have arisen in the daily work of plumbers and pipe fitters are given in this book, which is therefore practical from beginning to end. Every mechanic, whether expert or novice, should have on hand for constant use or for reference a copy of this the new fifth enlarged edition.

It tells How to Connect Kitchen Boilers and Water Backs Under all Conditions.
It explains Remedies to apply to all kinds of Difficult Cases.
Heating from Kitchen Boilers is fully described.

194 Pages. Size 6 x 9 Inches. 113 Illustrations. Cloth Bound.

Price One Dollar, Postpaid.

Practical Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the ***best methods of doing gas fitting.***

It fills a need experienced by American mechanics for a handbook giving ***plain and simple instructions*** in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

TABLE OF CONTENTS.

FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

SENT, POSTPAID, ON RECEIPT OF PRICE, BY

The Heating Trade.

The condition of business in the heating trade seems to be generally satisfactory. Many houses report that their sales this year, so far, have kept pace nicely with those of preceding years. This is evidence that the steam fitters are not only reasonably well engaged, but are also fairly satisfied with the prevailing prices. The enterprise of the manufacturers catering to this branch of trade is shown in the number of new boilers that have already been put upon the market this year, and in the improvements in goods that were previously popular. New radiators have also been brought out by some of the old houses in the business, and circulars are being distributed by a new radiator concern who are just entering the field. The information will doubtless be received with satisfaction that not only has the market for this class of goods held steady so far, but that, at a recent meeting of the manufacturers it was deemed inexpedient to unsettle the market by advancing prices. This policy reflects the conservatism of the trade, as the prevailing conditions would provide a sufficient reason for an advance at this time. The price of pig iron is holding remarkably steady at what is considered a high level, while molders' wages and the price of supplies have been advanced. In view of these facts it is natural to find some who strongly advocate advancing prices to meet the increased cost of production. The advisability of such a step has not lacked earnest and intelligent support when the matter has been under discussion, but after a thorough consideration of the subject the different views have become reconciled and the decision reached to maintain prices at their present level, for a time at least.

The Steam Supply Consolidation.

Evidence is now manifest that the lures of consolidation have attracted the manufacturers and distributers of steam goods and supplies. The subject first received attention about two months ago, and on discussion gained sufficient consideration to secure the appointment of a committee of representative manufacturers east of the Ohio River. Originally there was some intention of consolidating much wider interests, but the work of the committee has been confined to the territory mentioned. Apparently the plan of this consolidation has been eminently practical, for it includes not only the manufacturing plants, but also the distributing agencies. Some of the houses invited to consider the proposition with a view to final acceptance are large jobbers in their respective cities, while others are both manufacturers and distributers of supplies in this line. As far as can be learned, the basis on which the committee is working is that those who enter shall place a value on the plant, stock or whatever they have to offer, such as would meet the approval of careful business men, and receive cash in return. The book accounts of all that may enter the consolidation are to be retained by the old concern and collected by them. Should the combination be effected on such lines, the new company would be relieved of the work of a collective agency that would otherwise engross a considerable amount of their energy and attention. At the present time, however, the enterprise has not reached the point where it can be said that it is certain to be carried into effect, but those who buy valves, steam goods and supplies of that character undoubtedly will be informed of the consolidation through the proper channels, should the labors of the committee end in the organization of a large company devoted to this branch of industry in the East.

The United State Steel Corporation's Statistics.

The statistics of production recently issued by the United States Steel Corporation present the opportunity for some interesting deduction and comparisons. Considered alone, the figures are stupendous. They are particularly significant to those who are familiar with the general statistics of iron and steel production by the various countries of the world. Pre-eminence is especially shown in the output of steel. The total production of steel ingots in the company's fiscal year ending March 31, 1902, was 9,034,580 tons, which was 67 per cent. of the quantity turned out by all the steel works of this country in the calendar year 1901; over 40 per cent. more than the entire production of Germany in the same year, and over 80 per cent. more than the largest annual production of Great Britain. Taking the combined steel ingot production of Germany and Great Britain the figures show that the United States Steel Corporation turned out fully 80 per cent. as much. In pig iron the comparison is not so striking, as the furnaces of the corporation are almost wholly operated on pig iron for steel making purpose, while all iron making countries turn out a considerable product for foundry use. Nevertheless, a very good comparative showing was made in this branch. The total furnace product of the corporation in the same twelve months was 7,152,121 tons, or 45 per cent. of the quantity produced in the United States in the calendar year 1901; 80 per cent. of the largest annual output obtained in Great Britain and 84 per cent. of the largest annual production reached by Germany. If comparison could be made with the production of pig for steel making purposes alone it would undoubtedly be found that in this branch the corporation would display the same pre-eminence as in steel ingots.

Turning to another view of this matter, it should be observed that these figures show that the United States Steel Corporation have by no means the monopoly in steel or pig iron with which they were credited when the great project was launched. It will be remembered that various writers at that time estimated that the combined constituent companies would turn out from 80 to 90 per cent. of the steel product of the country and much more than 50 per cent. of the pig iron product. Their product, however, falls considerably below these percentages and would be still lower if comparison could be made with the country's output in the same twelve months as those covered by the corporation's statistics. The first three months of the calendar year 1901 were considerably less active than the first three months of 1902, and the product was therefore less. The statistics consequently show that a considerable part of the iron and steel production of the country is turned out by independent manufacturers. Their output is further increasing more rapidly than that of the United States Steel Corporation, as shown by current news regarding improvements in old works and the establishment of new ones.

St. Louis Fair Postponed.

The announcement by the management of the Louisiana Purchase Exposition, or, as it is generally called, the St. Louis World's Fair, of the postponement of the enterprise until 1904 was generally expected and therefore was not received with any surprise. It had been evident for some time past that the progress made with the buildings and grounds for the proposed exposition had not reached such a point as to make it probable that the exposition plant would be ready for opening in May of next year. The experience of other large expositions has shown that throwing them open to the public before they are completed, or in anything like regular shape, has been detrimental to the interests of such enterprises, and the St. Louis Exposition managers are wise in declining to run the risk involved in a premature opening. Moreover, the postponement of date will probably enable them to secure a better representation of American manufactured products and also to offer more of those attractions which are relied on to commend an enterprise of this kind to the general public. For example, in the matter of flying machines; some of the prominent inventors and others interested in the field of aerial navigation expect by 1904 to be able to make a much better demonstration than would be possible next year. If the managers of the St. Louis World's Fair are able to arrange with their exhibitors to have everything in place and in running order, without fail, on the day of opening, so that the public may be admitted to see the full attractions of the exposition from the very first, they will make an enviable record in the history of such enterprises.

Suggestions to American Exporters.

In a recent report to the State Department at Washington, Consul Thornwell Haynes of Rouen, France, presents, for the benefit of American exporters, some useful suggestions in regard to methods to be followed in order to successfully secure a market for their goods in France. He says that improper introduction often causes prejudice against American goods in that country, and he gives an instance in which American machinery was recently installed by a manufacturing concern in the city of Rouen. All the details were carefully looked after and the circumstances of climate, care, use, &c., were taken into consideration, the machinery being erected under the personal supervision of Americans. The success of the installation in question promises a considerable market for that particular class of machinery in France. In a neighboring city some American machinery of another kind was improperly constructed and installed. The result was failure, loss of reputation and the closing of that market, and perhaps others, to the sale of the machinery referred to. Not only, says the Consul, must attention be paid to the customs of the country when making a sale, but care should be taken that the goods are delivered in proper shape and condition. No American exporter can hope to build up a permanent and successful business in France unless he works for the good of his customers on that side.

The Consul believes that expositions of American goods in the principal cities of France would do much to extend American trade there. A Frenchman must have ocular and tangible demonstration of the validity of every claim made for an article. All the United States consuls abroad reiterate in their reports the uselessness of sending circulars, letters, &c., in English. The representative of a firm manufacturing heating apparatus told the Consul recently that he had learned that English circulars were worth nothing; that French circulars were better, and commercial travelers understanding the French language still better; but that an exposition of the goods most fully met all the requirements. The gentlemen referred to represents an American company who regard France, where only coal stoves and grates were known, as a splendid field for trade, and are not content with an exposition of their products, but have established a large factory near the center of France, in which they produce modern, up to date cooking appliances. The raw product comes from America, and the finished goods are gradually being sold all over France. So far this enterprising firm have a monopoly of the business and are succeeding wonderfully. Among the points suggested by the Consul as tending to facilitate an increased American export trade in France are to include all costs, such as freight and insurance, when quoting prices; to give long credits; to adhere strictly to the metric system of weights, measures and money values; to endeavor to sell the buyer what he wants, regardless of what the seller may think he ought to have, and to give the most careful attention to the question of packing and the manner in which the goods will reach the customer.

The crop prospects have improved materially during the past week, because of weather conditions. In the winter wheat belt especially, the weather has been all that could be desired at this season, needed rains having fallen over the region in which there has been a marked deficiency of moisture heretofore. Favorable reports are received from the Ohio Valley and also from the Northwest and California. In the Government May report the condition of winter wheat is regarded as indicating a total crop of between 340,000,000 and 350,000,000 bushels, which, if maintained, will mean a yield that has only been exceeded four times in the past ten years.

The Executive Committee of the National Association of Manufacturers have decided to move the general offices of the organization from Philadelphia to New York City. One reason for the removal is that it has been found difficult to get foreign buyers to go to Philadelphia, whereas in almost all cases they pass through New York. Moreover, the Empire City is more centrally situated for the convenience of the majority of the members of the association.

THE WESTERN STOVE TRADE.

Seldom, if ever, has trade been more active or more satisfactory in all lines of stoves, furnaces, boilers and other heating appliances than at the present time. Most manufacturers in this section have orders booked for fall delivery much in excess of last year or, in fact, any previous time, one or two reporting that they have booked more orders during the past five months than they did in nine months last year, and another more business 30 days ago than was taken the whole of last year. More business, too, has been done for spring, although up to the present time this has not been of a character to call for special comment. At this season of the year a lull is usually expected, and a number of salesmen are returning home preparatory for the fall trade. One foundry, finding business so active, was compelled to lay off salesmen for one month, but they are again on the road. The large volume of fall business already placed is attributed, in a measure, to the scarcity of and high prices prevailing for raw material. A general feeling among the consuming trade that whatever change there may be will be for the better has stimulated buying. Business in boilers and furnaces is in excess of the average business booked at this season, but notwithstanding the great volume of trade in this line for large buildings, there is a steady growth in stove and heater consumption. The activity in building small houses in the suburbs due to the increased number of salaried men who are providing homes accounts for this continued growth. Dealers are enjoying liberal sales of gas, gasoline and oil stoves and other summer goods. Little difficulty is experienced in obtaining full prices for all lines of goods into the construction of which iron and steel enter. The growth of the trade encourages manufacturers to enlarge their field of action, and more salesmen are being employed than at any previous time.

Considerable interest is felt in the trade regarding the agitation of a manufacturers' combination, but the impression seems to prevail that conditions, especially at the present time, are against the consummation of such a project.

MORE WALDORF-ASTORIAETTES.

BY JEEMS.

The nation has become so used to war that we are rapidly drifting into a grand military organization, and now have a well defined corps of business men, who rank by popular consent as "captains of industry," and the stove manufacturers have their industrial commandants, and some of those are of the regular old fighting stamp who used to make the captured walk the plank. They can chew iron and scuttle a stove and hang a man to the foreyard as good as any of the old buccaneers.

* * *

As business is conducted now it is war, and it is run on war methods. Raids are planned regularly from some industrial headquarters and the fun begins. The solitary vidette dodges along the road, then the skirmishers and finally the squadron, and then the whole caboodle rush on somebody's customers and the peaceful and quiet business relations of years are razooed off the earth. In the language of Captain Abe Mott: "It's Hell," as old Pop Sherman said.

* * *

Now no one would think for one instant that Captain Boal or Captain Barbour or Captain Kahn or Baron Van Cleave countenances these raids, although there are some who are unkind enough to say that they would, but the fact is in evidence that they are fully alive to the danger and unpleasantness of these raids on the enemy's territory, and, like General Grant, they say, "Let us have peace." Amen.

* * *

One of the prime reasons adduced in favor of consolidation is that it largely represses the greatest of all evils in business, "undue and pernicious competition." Now is that a good thing to do? Read the following extract from one of Dr. Rainsford's sermons:

> When we denounce competition we denounce a divinely ordained process for weeding out the imperfect. Nay, further, we denounce the only conceivable process by which sorrow, pain, imperfection and at last death itself can be done away. Let us gird up the loins of our minds, face facts and cease crying for the moon. By competition we are what we are. By competition our children shall be, please God, better than we. God's great competitive examination board is ever in session, and through it our nation has been lately passing, as you well know; for what after all is war but the competitive examination of nations?

Some will say the doctor is "nutty," but should it be proved that "competition was a divinely ordained process" you might just as well give up at once. You cannot succeed.

* * *

There were a great many wise Mikes around, inside and outside the meeting, who could point out exactly the proper caper and the cheesy thing to do, but they got no chance to get off their bazoos. One of those said: "Nixy wixy" (that's Bowery for "you don't get it") "unless I get a cheque for the whole business. No stock for me." This shows what many expect when they hand over their valuables. We will see about all this later.

* * *

The all-together plan is nearer completion than many think. The fact leaked out that they had secured the second floor of the "Flat Iron" on Broadway and Twenty-third street for offices, &c. They wanted the first floor, but Morgan got it for his steamboat lines. It was a great stroke of business to locate there, so handy to everything. It is just like a country foundry office—it's so different. It is fair to say that the report is denied, "but what the deuce was that crowd always looking up at that building for," said a member.

* * *

President Parlin delivered his address and presided in true New England style. The fact is you would think you was in the "Old South" in Boston listening to one of those good old homilies that the church was famous for. Squire Parlin, as he is known "to hum," is a mighty big man, and a sterling man in all respects.

* * *

In spite of all the attractions around New York it is doubtful if ever a larger number attended the sessions. The room was always full, and the consequence was that things were dispatched on time.

* * *

"Them air camp followers air a great lot, ain't they?" exclaimed one of the members from an outlying district after he had been called from labor to refreshment by some of the troop. Right he was. There was Captain of Industry Latty that kept them all in line. He had dress parades of the squad several times a day, also at stated intervals in the evening *à la militaire:*

Sergeant (saluting): "Mornin', Cap'n."

Cap'n: "Mornin, min. Yez look as fine looking as a lot of down East quahogs waiting for the tide to rise. Shure you need it. Sarjint Ireland, take the min down to the beach and fill them up. There will be a big spring tide this day."

"What's the matter with Cap'n Latty?"

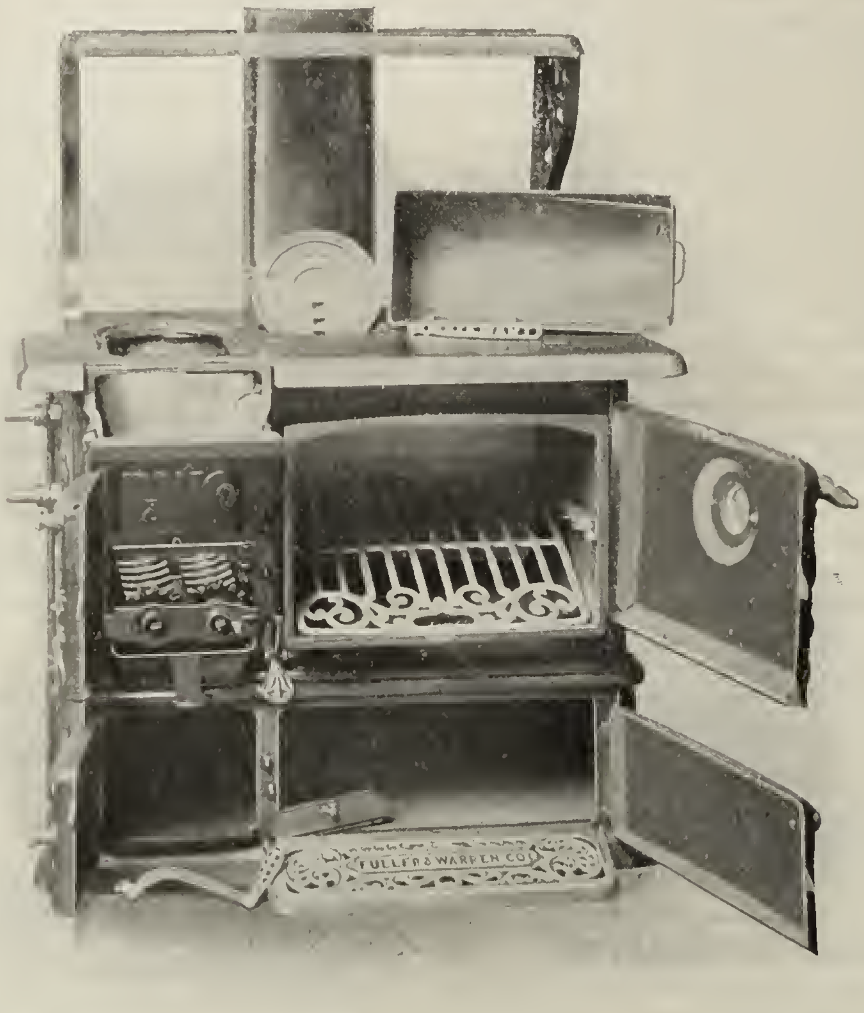
"He's all right!"

* * *

A very strong effort was made to hold the next meeting in New York, but the claims for other places to have it were conceded, and Cleveland was chosen. Cleveland can really claim the honor of being one of the landmarks of the association. It was there that the Defense Association was first formulated and organized and a salaried secretary was appointed, which contributed so materially to the success of the organization. It was also the scene of an oratorical outburst of Jake Smyser of Louisville, Ky., regarding prices of one of the prominent members at that time. Jake was old Kaintuck out and out, and would stand for no fooling. He was a powerful advocate then for consolidation, but as it did not work he went out of the stove business and took to car building, got it in big shape and went into a so-called trust. The consequence is Jake is living on Easy street, with nothing to do but play Ping-Pong or Bridge and hack off coupons. How lucky! Jake always practiced what he preached, and he was a right powerful preacher.

The Ideal Stewart Range.

The stove dealer who is desirous of securing a range capable of meeting a wide variety of requirements will be interested in the Ideal Stewart French or flat top range, made by the Fuller & Warren Company, Troy, N. Y. The illustration given in Fig. 1 shows this range as adapted for general and house use where a high grade range is desired. As may be seen, the grate can be readily removed from the fire box. An ash sifter is provided beneath the grate, and a large ash pit with an ash pan. Beneath the oven is a warming closet, and the oven door is provided with what is now proving to be a great convenience to housewives—an oven thermometer. The top is equipped with Boston covers, so that cooking utensils of different diameters may set directly over the fire. Fig. 2 shows the damper construction and arrangement by which the operation of the range is governed. It is pointed out that the damper lever, or rod, is entirely outside of the range, instead of in the flue, and in consequence is not exposed to the fire or its effect and is practically indestructible. The damper is balanced so that it is readily operated. This range is made with large water backs, and is also provided with large reservoirs attached to either the right or left hand ranges. The ranges are made with 6, 8 and 9 inch covers, ovens 18 and 20 inches square, high shelves and warming closets, and all the usual conveniences.



The Ideal Stewart Range.—Fig. 1.—View Showing Features of Convenience.

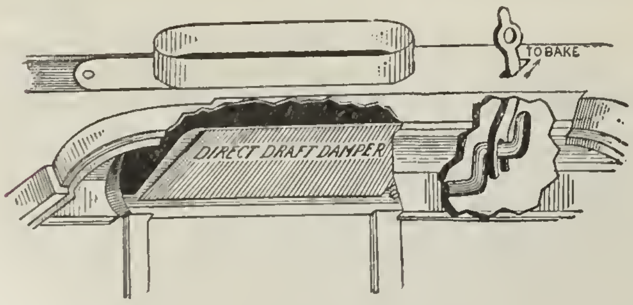


Fig. 2.—The Damper Construction.

A new feature is the twinning of these ranges for use in hotels or large boarding houses. By the use of special castings the oven ends of a right and left hand single oven range are connected, giving a fire at each end, 12 8 or 9 inch boiler holes and two 20-inch ovens, the top being 28½ x 83½ inches long. The advantage of having two fires at opposite ends of the range is a great convenience where a great deal of cooking is done. Above these ranges, a three-section hot closet is provided. They are also equipped with extra large water fronts. Another advantage is that it is not necessary to run both fires when only a small number are to be cooked for. The company make, as a part of the equipment for kitchens where these ranges are used, a special boiler fitted for the use of either hard coal or charcoal.

PHILADELPHIA HEATER AND RANGE ASSOCIATION.

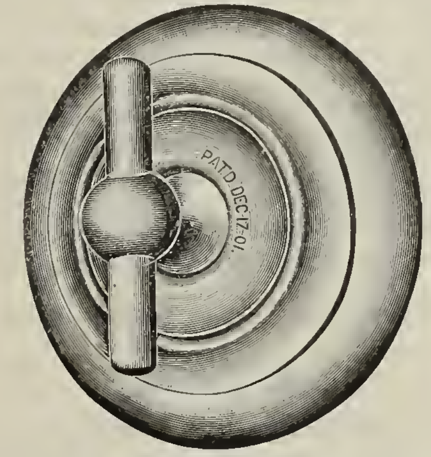
The regular meeting of the Philadelphia Heater and Range Association was held at the Builders' Exchange in that city, Wednesday, May 14. There was a good attendance, and after the regular business of the meeting the election of officers for the ensuing year was held, resulting as follows:

President, Edward Richards.
Vice-President, Robt. Baile.
Secretary, J. H. Osmond.
Treasurer, C. C. Augustine.
Trustee, William Earley.

An interesting address was made by the president, in which he explained the object and the benefits which have resulted from the efforts of the association. The interest displayed by those present is an indication of a successful future for the organization. At the close of the meeting luncheon was served.

Sheet Metal Draft Register.

The H. A. Matthews Mfg. Company, Seymour, Conn., well-known manufacturers of stove trimmings, have recently put on the market the patented sheet metal draft register of which an illustration is given herewith. The threads are cut and the disk is securely fastened without cotter pins or washers and the register can be made either loose or tight, as required. The company manufacture these registers in stock sizes—2½, 3, 3½, 3¾, 4, 4⅛, 4½ and 5¼ inches—but they are also prepared to make them in quantity in any other sizes.



PAT'D DEC.17.01.

Sheet Metal Draft Register.

ODD PLATES.

The H. Adler Mfg. Company, Pittsburgh, Pa., are receiving bids for the erection of a new plant, which they are about to put up at Carnegie, Pa.

The Syracuse Stove Company, Syracuse, N. Y., have advanced the wages of their employees from 5 to 10 per cent.

The Glazier Stove Company, Chelsea, Mass., will erect a brass foundry in connection with their plant containing six furnaces.

The Novelty Wickless Blue Flame Stoves are the subject of a little pamphlet lately issued by the Novelty Mfg. Company of Jackson, Mich. The goods are illustrated and briefly described, and in connection with the matter is a table showing the comparative cost of gas and oil for fuel purposes. Strong claims are made for the Aluminum Oil Heaters, which the company manufacture, these being offered in several sizes with oil founts ranging in capacity from 3 quarts up to 1½ gallons. These Heaters are claimed to be smokeless and odorless, and it is said the flame will not climb up after lighting, as it does in some of the old style Heaters.

A neatly printed catalogue sent out by the Lithgow Mfg. Company, Louisville, Ky., illustrates and describes the various lines of Capitola Stoves and Ranges turned out by this enterprising concern. The goods are made in such variety as to meet all reasonable requirements, special attention being called to the Capitola Steel Range, which is made with single and also with double oven. The ornamentation of the company's Cast Cooks and Ranges is rich and effective, and the constructive features are of the modern type. Numerous lines of Heaters, which are shown, include Oak, Franklin, Globe, Cannon, Box and Laundry Stoves. A miscellaneous line of Hollow Ware, with prices and dimensions, constitute a feature of the closing pages of the work.

The North Dighton Co-operative Stove Company, with office and foundry at Taunton, and post office address North Dighton, Mass., call attention to the merits of the Oakland Queen Range in a four-page folder which they issue. The Range is made in three sizes, adapted for using wood or coal as a fuel, has a large oven with two racks, and the company claim it will cook evenly three tiers of food at a single baking. The back of the oven is covered with aluminum, thus rendering the oven light and at the same time filling the pores of the iron, thus tending to prevent the heat from escaping through the back. A neatly printed pamphlet in colors illustrates and describes the Oakland Ranges and Parlor Stoves, which are offered in several varieties and embody the latest features of construction and ornamentation.

The Central Oil & Gas Stove Company of Gardner, Mass., set forth the merits of their Blue Flame Oil Stoves and other specialties in a profusely illustrated pamphlet designed for general distribution among the trade. These Stoves are offered in a variety of styles and sizes and embody such features of construction as to render them the basis of strong claims on the part of the manufacturers. In addition to Automatic Blue Flame Oil Stoves the company call attention to a great variety of Lamp Stoves, to the Fairy Queen, Summer Queen and Reliance Oil Stoves, Hot Plates, Nursery and Heating Burners, &c.

The Safety Furnace Pipe, which is claimed to be manufactured on scientific principles by the Safety Furnace Pipe Company of Detroit, Mich., is the basis of an interesting pamphlet which the makers have issued for distribution among the trade. The Pipe is referred to as economical, safe and durable, each and every section being double and so constructed that air passages running its entire length between the inner hot air duct and outer casing are supplied with cold air through a foot piece of peculiar construction. It takes up the heat radiated from the hot air duct and brings it again into use through the upper section of the register box, thus keeping the outer casing cool and safe, and at the same time saving the heat thrown off by the inside duct.

The annual meeting and election of officers of the Keely Stove Company was held on May 12, at their office in Columbia, Pa. The reports of business transacted during the fiscal year were highly satisfactory, showing the enterprise to be in a flourishing condition. The election of directors resulted in the selection of the following: Horace Detwiler, Hiram Wilson, H. F. Bruner, William Patton, J. H. Herr, D. H. Detwiler, W. B. Given, William Morris and Frederick Bucher. The board organized by electing the following officers: President, H. F. Gruner; secretary and treasurer, Edward Shomier, and solicitor, H. M. North.

The *Bee* of Toledo, Ohio, says that H. L. Slosson, secretary and treasurer of the Charles Thatcher Company of Waterbury, Conn., has been in conference with representatives of the Toledo Chamber of Commerce with a view to selecting a site for a proposed factory for the manufacture of Asbestoline Non-Rustable Stove Pipe and other goods, which will be manufactured by a company now being organized with a capital stock of $50,000. The company are anxious to locate themselves in the Middle West, and the advantages of Toledo for this purpose are being carefully considered.

The Malleable Steel Range Mfg. Company of South Bend, Ind., are offering the Malleable Range for families and hotels in a great variety of styles and sizes. This Range embodies the modern features of construction, and the company state that only the best materials and workmanship are employed. The makers also turn out a Combination Coal and Gas Range, this being offered in two sizes and intended for using artificial or natural gas. There are several sizes of Range suitable for hotels, and in addition to Gas Ranges the company are prepared to furnish kitchen outfits, including Steam Tables, Carving Tables, Charcoal Broilers, Coffee and Tea Urns, &c. In a catalogue which the company are sending out directions are given for operating the Malleable Range, and there is a short chapter on malleable iron.

The H. E. Hessler Company, Syracuse, N. Y., have issued a catalogue devoted to Water Fronts for Stoves and Ranges. A feature of the catalogue is a notice that "the Water Fronts and Repairs for the Stoves and Ranges sold by the house are not made from original patterns and are sold with this understanding, no attempt being made to deceive the purchaser. The Repairs are warranted to fit the Stove or Range called for, and if not satisfactory may be returned." The catalogue consists of 32 pages, and an alphabetical list of the names of a large variety of Stoves for which Water Backs are carried in stock. The concern also state that in addition to Water Backs they carry a large stock of Stove Repairs, as well as a full line of Tin Shop Supplies, Tin Plate, Sheet Iron, Rivets, Stove Bolts, Stove Putty and Fire Clay.

The American Vapor Stove Company are having plans prepared for an addition to the power house of the Dangler Stove & Mfg. Company, recently absorbed by them. The plan is to install additional electrical equipment with a view to operating the plants of the Standard Lighting Company and the Schneider & Trenkamp Company, both of which have also been absorbed by the American company. All machinery in the three plants will be driven by motors.

George H. Barbour, vice-president and general manager of the Michigan Stove Company, Detroit, Mich., has been appointed chairman of the Legislative Committee of the National Association of Manufacturers. This is the largest and strongest organization of its kind in America, embracing in its membership all classes of manufacturing interests. The Legislative Committee will look after some of the most important interests of the organization, and the chairmanship of this committee is therefore a position of honor as well as great responsibility.

The Art Stove Company, Detroit, Mich., have secured a building seven stories in hight, 43 x 90 feet, at 79 to 83 South Jefferson street, Chicago, which they have fitted up as a sample room and warehouse for the product of their foundry. They already have nearly a full line of their 1902 Stoves and Ranges on exhibition, not a few of which show improvements over the patterns of a year ago. Henry H. Sanford, who has long been located at Detroit, is the manager of the Chicago branch, and there can be little doubt that a vigorous policy is to be adopted and maintained in that territory.

In announcing in our issue for May 10 the organization of the New Century Stove Company, the location of the place was inadvertently given as Moxham, W. Va., instead of Moxham, Pa.

The St. Louis Enameling Company, Ninth and Monroe streets, St. Louis, Mo., have just issued an interesting little pamphlet setting forth the merits of the Enameled Steel Ranges which they manufacture in varieties adapted to meet many requirements. The manufacturers point out that "the greatest merit in the artistic Enameled Steel Range is that the regulation of heat has been reduced to such mechanical precision that perfect results in cooking are insured even to the most inexperienced." Special reference is made to the economy and durability of these Ranges and to the fact that while the company only carry in stock the blue mottled and brown mottled Ranges, they can furnish them in any color, such as white, light brown, light blue, delft, yellow, &c., with very handsome decorations. In addition to the illustrated description of the Ranges, there are presented numerous testimonial letters from some of those who have used the company's goods.

W. H. Colebrook Sons & Co. of Syracuse, N. Y., are distributing an advertising novelty in the shape of a card, measuring 5 x 7 inches in size, to the upper portion of which is fastened a miniature shovel. Above and below the shovel is the inscription, "We mean to keep digging at you to secure your Cement order." Attention is called to Colebrook's Asbestos Furnace Cement and Stove Putty, which is strongly recommended for making Furnaces and Stoves gas tight. The company have selling agencies in Chicago, Baltimore, Philadelphia and Boston.

The improvements in the plant of the Excelsior Steel Furnace Company, 38 and 40 West Monroe street, Chicago. which were begun about three months ago, are nearly completed. The enlarged premises give the concern almost 100,000 feet of floor space, all well lighted and admirably adapted for the purposes intended. Two elevators and four shipping doors afford ample facilities for handling the product of the plant. The basement and main floor are devoted to offices, storage and shipping, the second and third floors to the manufacture of Furnace Pipe and Fittings, and the fourth and fifth to the production of Stove Pipe, Adjustable and Stationary Elbows. The improvements cost in the neighborhood of $25,000.

The Michigan Stove Company have been remodeling the offices and salesrooms in their six-story warehouse building on Clinton street, Chicago. The changes as made are highly satisfactory, the new arrangement of the offices, especially, providing the clerical force much needed light from which they had heretofore been cut off by the old arrangement. The offices are now commodious and attractive, artistically furnished and equipped with all modern appliances. The arrangements in the salesrooms are practical, facilitating the exhibition of the samples of the complete stock carried. Many carloads of goods are now being received preparatory to filling the heavy orders booked for the fall trade. It is notable that the advertising matter, the liberal use of which has made the product of this company well known throughout the country, is carried in large volume, and is conveniently arranged for speedy distribution.

H. M. Kellogg.

In a letter received from H. M. Kellogg of Cortland, N. Y., he informs us that he has sold out his hardware, stove, plumbing and furnace business to the firm of Cramer & Spencer, who will continue the business along the same lines. Mr. Kellogg began his mercantile life in Cortland on April 1, 1871, in the firm of Cloyes & Kellogg, dealers in crockery and groceries. In 1876 the business was sold out to Mr. Cloyes and Mr. Kellogg formed a partnership with Colonel Frank Place, who had been clerk of the county for nine years. The firm of Kellogg & Place purchased the hardware business of Wickwire Brothers. In 1881 Mr. Kellogg bought out his partner's interest, and for the past 21 years has conducted the business under the firm name of H. M. Kellogg. In 1884 the entire business was wiped out by a disastrous fire, which destroyed several blocks, but he purchased a complete new stock and resumed business as soon as the block was rebuilt. When the business of Wickwire Brothers was purchased the firm had begun in a small way to weave wire cloth and to manufacture coal sieves, having two or three hand looms in operation. This was the beginning of what has grown to be a great industry under careful and excellent management. It is now among the leading industries of Cortland, and is said to be one of the largest enterprises of its kind in the world, employing million of dollars of capital and 1000 workmen, and still expanding.

After 31 years of active, strenuous business life, on duty nearly every day, Mr. Kellogg now proposes to take a little vacation and rest. He says that it is with regret he severs his business associations with the hardware trade, with which he has so long been identified and in which he has formed so many pleasant business acquaintances. He has been a reader of *The Metal Worker* for many years and an occasional correspondent. In bidding good-bye to the "old boys" in the trade, he extends his thanks to them for many favors and courtesies extended to him, and says that he will always be proud to have been associated with such a body of solid, substantial business men, and wishes them, as well as *The Metal Worker*, abundant success in the future.

The store of F. P. Beachy, Carleton, Neb., was badly damaged by fire a short time since. A portion of their Hardware stock in store was saved, and all of their Agricultural Implement and Vehicle stock, the latter being kept in a separate warehouse. Mr. Beachy has resumed business, and expects to continue on a larger scale than in the past. With this in view he is intending to erect a large brick block before the year is out, and will then have a modern up to date store. Mr. Beachey's library of catalogues, price-lists, &c., was destroyed in the fire, and as he is desirous of duplicating them he will value printed matter relating to Shelf Hardware, Stoves, Tinware, Agricultural Implements, Vehicles, Sporting Goods, &c.

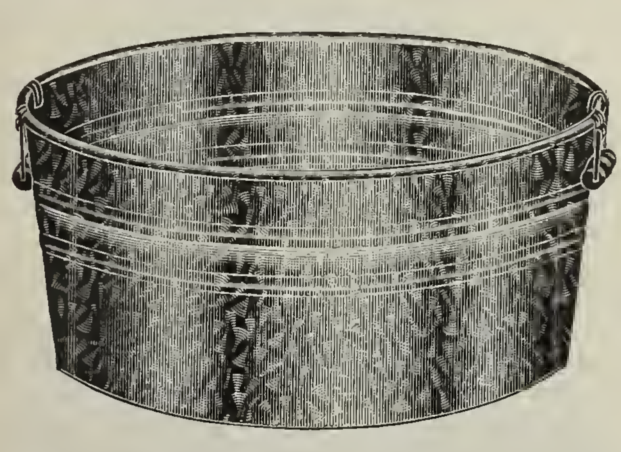
Century Rural Mail Box.

The Century Rural mail box made by Briscoe Mfg. Company, Detroit, Mich., is one of the boxes approved of by the Post Office Department. Since acquiring this business from the Century Rural Mail Box Company last fall the company have improved it in a number of particulars, so that as now offered they are confident it fills all requirements. This box has heretofore been almost entirely handled through agents and canvassers. The company have, however, decided that this business belongs legitimately to the hardware trade, and they are making every effort to induce country merchants to handle the mail boxes, in view of the market created for them by the Government and the good profit connected with their sale. To this end they issue a circular in which particulars are given of an offer by which merchants are enabled to secure a sample of their Rural mail box free of charge.

◆

The Brosi Galvanized Steel Washtub.

In addition to the regular line of galvanized washtubs, the Fred. T. Brosi Company, Quincy, Ill., are just placing upon the market the Brosi patented wood handle galvanized steel washtub, a general view of which is given in Fig. 1. These washtubs are made of high grade steel sheets, thoroughly galvanized. They are furnished with heavy bail wood handles, as shown in Fig. 2. In fitting the handle to the tub no rivets are used, but the construction is so arranged that it is practically impossible to tear the bail from the tub. The fastening used for this purpose is shown in Fig. 3. The handles are made of the best selected hard wood and are insured against splitting. By means of these handles the tub can be lifted with much greater ease than tubs having rough iron or wire handles, which are apt to cut the hand.



Brosi Galvanized Steel Washtub.—Fig. 1.—General View.

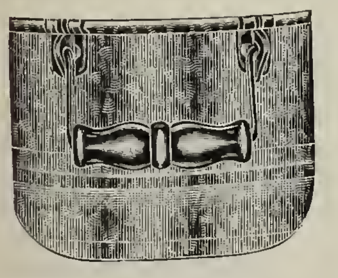


Fig. 2.—Handle and Attachment.

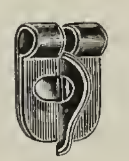

Fig. 3.—Patent Fastening.

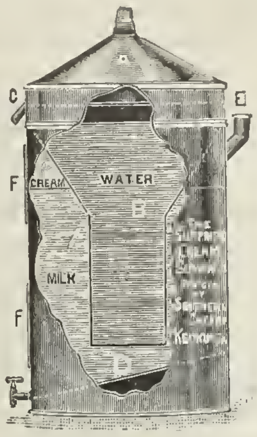
◆

The Surprise Cream Separator.

The Seither-Cherry Company, Keokuk, Iowa, are offering the cream separator shown herewith. The letter A represents the cover and strainer; B, the inside reservoir; C, the overflow tube; D, the sloping bottom; E. the filling tube, and F F, the glass gauges. The separator is referred as being of good heavy tin and durable. In operation the separator is placed on a box or platform that is high enough to permit a bucket to be placed under the faucet. The inside reservoir is filled with cold water, and the cover or strainer is placed in the tube of the outside can. The milk is then poured into the outside can and allowed to stand for 30 minutes. Cold water is then poured in, which will force the warmer water out through the overflow tube. The changing of the water is to hasten the separation. It is stated that the separator is not complicated; that the inside can may be lifted out easily; that it is easily cleaned, and that if used as directed it will separate cream from milk in from three to five hours.



Patent Applied For.

The Surprise Cream Separator.

◆

The Sayres Corn Grater.

The accompanying cuts represent corn graters manufactured by Chas. W. Sayres, York, Pa., McClellan & Gotwalt Company, of the same city, selling agents. The grater is neatly made of clean poplar wood, 5 x 11 inches in size, having a tinned steel scraper and steel cutters. It is designed to remove fresh corn from the cob, for making fritters, puddings, &c. With the grater, it is explained, the grain and milk of the corn are removed while the hull remains on the cob. The graters shown in the illustrations are the same, except that the one in Fig. 1 is intended to use in a bowl or similar vessel, while that in Fig. 2 is designed to be placed over a low vessel.

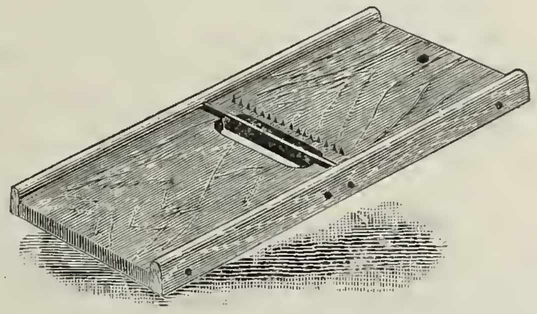


Fig. 1.—The Sayres Corn Grater.

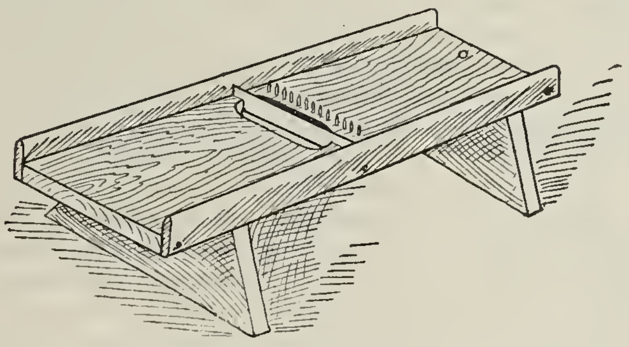

Fig. 2.—The Sayres Grater with Feet.

◆

Wm. Inglis Wire & Iron Works, Detroit, Mich., have issued a catalogue section B. This is devoted to illustrations and descriptions of Heater and Ventilator Screens, in grille and wicker ornamental metal work. The concern also manufacture Metal Work for various purposes, Electric Lamp Guards, Window and Door Screens, &c.

New York State Association of Retail Hardware Dealers.

A special meeting of the directors of the New York State Association of Retail Hardware Dealers was held in Saratoga on the 14th inst. A large proportion of the directors were present, which was very gratifying, in view of the fact that this is a season of the year when the average hardwareman finds it difficult to get away from the store. A number of important matters concerning the new association were discussed, and several resolutions were passed giving the efficient and aggressive secretary, John R. Taylor, of Little Falls, certain powers which will make it unnecessary for the directors to come together again for some time. In the evening the visitors were handsomely entertained by O. D. Towne and F. W. Gardner of Saratoga at a banquet at the Worden Hotel. The president of the village and a number of persons well known locally were also present. Addresses were made by some of the gentlemen, and the occasion was a most enjoyable one.

A New Freezer Company.

The Alaska Freezer Company, Winchendon, Mass., incorporated under the New Hampshire law with a capital of $100,000, held their first meeting Monday, May 12. The following officers were elected: Wm. H. Brown, president; Wm. H. Barron, vice-president; E. D. Sargent, treasurer and general manager. The above named, with Arthur L. Brown and Mary E. Brown, constitute the Board of Directors. The new company are erecting a substantial main factory building, 40 x 120 feet, two stories and basement, and a galvanizing room, 24 x 40 feet. The plant will be supplied with power from the wooden ware establishment of Wm. Brown & Sons. The product of the company will be known as the Alaska Freezer, and will be made in 12 sizes. The general design of the Alaska, we are advised, will be along established lines and will embody the latest and best in freezer construction, varying considerably, however, from the goods now in common use. Leading features will be a new device for protecting the gears from the salt and ice, spoon shaped floats set at angles from the dasher, and the triangular shape of the complete dasher, making it very easy to free the frozen cream when removing the dasher from can. E. D. Sargent, the treasurer of the company, was formerly Eastern representative of the White Mountain Freezer Company, and is well known among the jobbing trade.

New Miller Lamps.

Edward Miller & Co., Meriden, Conn., and 28-30 West Broadway, New York, have now on exhibition a large number of handsome new designs in lamps for various purposes. There is a large assortment of hanging lamps in new finishes, one of which is a fine green, another a rich shaded red, together with old brass effects, Ionian red and a deep green that harmonizes with almost any interior decoration. These finishes are on brass bases. The lamps take 14-inch opal plain or decorated shades, and have bands pierced so that they can be completed with glass prisms if desired, the latter decoration being especially effective in connection with the export trade. The new table or reception lamps range in size from 12 to 24 inches high to the top of the burner. These to a great extent have the same color effects as found in the hanging lamps. There are richly ornamented as well as plain designs. One is a mat green with metal parts finished in Etruscan gold. Another is in spun brass base with cast feet, the two parts being finished in two colors of brass—one bright and the other an antique finish—for contrast. There are in all about 75 styles from which to make a choice. Another new feature in lamp goods is the electric portables or table fixtures, of which there are about 24 new styles and patterns. These are used the same as the gas portables, except that instead of conveying gas through a tube the electric current is conducted through wires from the chandelier or other source of supply. A new feature in this portable is a beaded chain, by a pull of which the lamp is lighted, another pull extinguishing it.

Stove and Hardware Dealers.

The Retail Hardware Merchants' Association of Ontario, Canada, which was organized May 16, 1901, held its first annual meeting on the 8th inst. in Toronto. The following officers were elected for the ensuing year: E. R. Rogers, Toronto Junction, president (re-elected); Mr. Hawkins, Oshawa, first vice-president; S. Pearsall, Toronto, second vice-president; Jas. Ivory, Toronto, third vice-president; S. J. Greer, Toronto, secretary, and John Caslor, Toronto, treasurer (re-elected). The new Executive Committee comprises the above officials and Albert Welch, T. Hunter, Geo. T. Munn and M. W. Shepherd. This association, while just one year old, is doing good work and will doubtless become increasingly influential in correcting or minimizing some of the evils which confront the trade in the territory covered by it.

The Chicago Wooden Ware Company, manufacturers of Step and Extension Ladders and Wooden Ware sundries, have issued a small illustrated catalogue, together with a list of their specialties of manufacture. Special stress is laid upon the Step Ladders made by the company, in which Southern pine is utilized, strength being one of the features to which attention is called. The company have factories in various places in the South, as well as at Chicago, and they are now calling special attention to their lawn goods, such as Swings, Settees, Chairs, Hammock Frames, Stools, &c. The company have recently placed upon the market a patented Extension Clothes Line Prop. The Prop can be folded to a 5-foot length and is adjustable to any length from 5 to 9½ feet. It is made strong and has galvanized iron mountings, and there is, it is stated, nothing to get out of order or to break.

Frank Grim has opened a new Tinware store at Sharpsburg, Md.

J. M. Hoefer & Son, dealers in Hardware, Stoves, Farming Implements, Sporting Goods, &c., Kildare, O. T., has been succeeded by Watts & Harper.

U. G. Fowler has succeeded U. G. Fowler & Co. in the Hardware, Stove and Sporting Goods business in Huron, S. D.

Geo. H. McCrea is the proprietor of a new store in Chewelah, Wash. Mr. McCrea handles Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements and Sporting Goods.

John P. Ackerman has lately opened a store at Monaca, Pa., handling Shelf Hardware, Stoves and Tinware and Sporting Goods.

A disastrous fire, which visited the town of Houlton, Maine, on Saturday, May 17, destroyed the Stove store of C. F. Thorn.

The Wagner Mfg. Company, Sidney, Ohio, have recently installed at their factory a new power plant consisting of a 150 horse-power engine and boiler. The company are making a number of other improvements in their plant. They report that their new Aluminum foundry is running satisfactorily and turning out the full capacity of production.

The Blacklock Foundry, South Pittsburg, Tenn., have made an addition to their foundry, and put in a new cupola and blower, by which their capacity is doubled. Their lines of manufacture are Sinks, Sad Irons, Stove Hollow Ware, Sugar Kettles, Grate Fronts and general Foundry Castings, the first four named being specialties. Business last year was very satisfactory. This year so far has not been so favorable, but present indications are that on its termination the total will be larger than that of 1901.

St. Louis Enameling Company, St. Louis, Mo., issued a circular calling attention to their line of Enameled Steel Signs. These Signs are said to be practically unbreakable and require no polishing or cleaning. Originality in design and lettering can be embodied in an attractive and effective manner, and the cost is said to be on an economical basis. Many Signs of general demand in office and factory are kept constantly in stock. A special department is also conducted with every facility for prompt execution of orders for enameling of all varieties of specialties.

DEATH OF SAMUEL L. MALCOLM.

The news of the sudden death of Samuel L. Malcolm, at his home in New York City, on the afternoon of Saturday, May 17, at the age of 61 years, will be received as a shock by the plumbing trade, owing to his wide acquaintance with plumbers throughout the United States and the firm friendships established by his kindly nature and the cordial greeting which he gave to all who came in contact with him. Mr. Malcolm attended a meeting of the local master plumbers' association last Friday and died the following day, at his home, 313 West 112th street, without any intimation of serious illness, passing away quietly from heart failure while one of his daughters was reading to him.

He was born in Lebanon, N. Y., June 1, 1842, and was the head of the plumbing firm of Malcolm & Taylor, at 626 Sixth avenue, New York City. Mr. Malcolm had been prominent in plumbing circles for a number of years, taking an active interest in trade protection and lending his assistance in all efforts to that end. He filled different offices in the master plumbers' association in his city and had been honored by being its president. He had also been a delegate to the conventions of the National Association of Master Plumbers for a number of years and won the confidence of the members all over the country by his sagacity and conservatism in its councils. When the convention of the National Association was held in New York on June 17, 1897, Mr. Malcolm was elected vice-president, and at the National convention at San Antonio, Texas, on April 15, 1898, he was elected president of the body. As ex-president, his counsel was always sought by those who directed the affairs of the National Association after his retirement.

SAMUEL L. MALCOLM.

Mr. Malcolm was a veteran of the Civil War, a Free Mason and a member of a number of societies and charitable organizations. He is survived by a wife and five grown children. The funeral services, which were held at his late residence in New York City last Tuesday evening, were attended by a large number of the members of the master plumbers' associations of New York and adjacent cities.

Alfred H. Gilby has been appointed Inspector of Plumbing by the Health Board of Bellville, N. J.

CALL FOR THE ANNUAL CONVENTION OF THE NATIONAL ASSOCIATION OF MASTER PLUMBERS.

Under the date of May 15 President E. D. Hornbrook has issued the following convention call to the members, State and local associations affiliated with the national body:

The twentieth annual convention of the National Association of Master Plumbers of the United States will be held in the Auditoroum on the Steel Pier, Atlantic City, N. J., June 17, 18 and 19, 1902.

The opening session will be called to order at 10 o'clock on Tuesday morning, the 17th.

The New Rudolf Hotel will be headquarters of the National Association.

The letter of April 19, 1902, sent you from the National Executive office gave hotel rates, instructions as to the election of delegates and inclosed blank form on which to report delegates and alternates to this office as soon as elected—an item of importance that should be attended to promptly.

Arrangements are about completed whereby the Western Passenger Association, Central Passenger Association and Trunk Line Association will make rate of a fare and one-third for the round trip on the certificate plan for those attending the convention, and secretaries of local associations will be advised more fully as to this matter a little later, when all details are made up.

The Atlantic City convention will be the most important in point of attendance and interest yet held by the National Association, and no local organization or would be down to date master plumber can afford to miss it. Remember you will be admitted to the Auditorium on the Steel Pier, where the convention sessions are to be held, whether delegate or not, and entitled to all privileges in the way of hotel and railroad rates.

The fact that we meet this year in Atlantic City, one of the most delightful seaside resorts, should insure an unusually large attendance, and it is hoped will produce an enthusiastic interest in the work that will reach the extreme of our membership.

All local, district and State organizations should see to it that their full quota of delegates are elected and present at the convention. The important item to be considered is the Cleveland Resolutions, which are universally considered the most effective yet adopted for our mutual benefit.

The National Association of Master Steam and Hot Water Fitters will meet in Atlantic City, June 12 to 14, the week preceding our convention, and our delegates can attend both gatherings if they choose to go early. The bathing, which is always the best, will hold good during the interim of the two conventions; so will hotel and railroad rates.

Everybody to Atlantic City this time.

The Independent Practical Boss Plumbers' Association.

As a result of the strike in the plumbing trade in Bloomfield and Montclair, N. J., the Independent Practical Boss Plumbers' Association was organized at a meeting held in Cranley's Hall, Montclair, on Saturday night, May 17, with 19 members of the trade in attendance. After discussing the matters of contention in the strike and agreeing that the plumbers should be allowed to work for anybody who was willing to pay them the union wage scale, the work of organization was perfected. Officers were elected as follows:

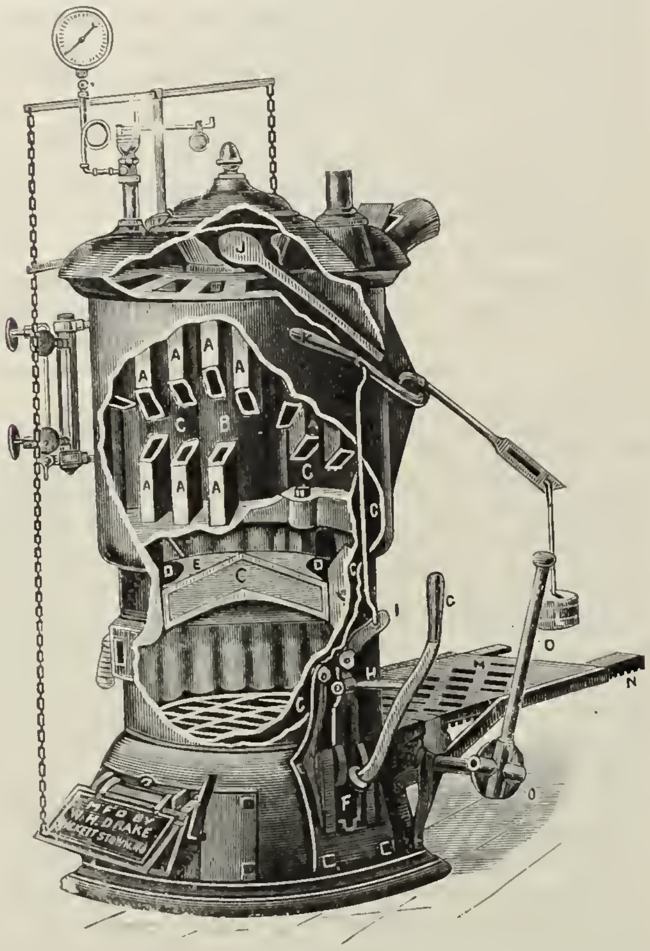
President, John Stanford, Bloomfield.
Vice-President, John Kaveney, Montclair.
Treasurer, Raymond Keisted, Upper Montclair.
Secretary, William Crystal, Montclair.

The following Executive Board was also named: George Gasser and John Meyers of Montclair, and John Stanford of Bloomfield.

Frank C. Van Scoy, plumber, has removed his place of business to 53 South Main street, South Norwalk, Conn.

The Torrid Fine Coal Boiler.

An illustration is presented herewith showing a broken view of the Torrid boiler especially designed for burning fine coal, which is made by W. H. Drake, 36 Clinton street, Newark, N. J. These boilers have been used by the trade for the usual grades of coal for some years, and have established a fine reputation for efficiency and economy. The construction provides for a large amount of surface against which the water lays and against which the products of combustion play in passing through the smoke outlet. The special feature of the new boiler is its arrangement for burning fine coal. The boiler is of the self feeding type, having a coal reservoir through the center. It is claimed that, by a simple adjustment of the grate levers, the fuel is delivered to the fire chamber automatically. The grate will hold the bed of the fire at a uniform depth sufficiently thin to admit air so as to burn fine fuel and yet keep the fire alive and free from ashes. A cut off slide is provided at the rear and so arranged that, by means of levers, it can be passed through the fire box between the live coal and the ashes, thus separating them, when the grate can be turned and all the ashes and cinders discharged into the ash pit, keeping the fire intact, after which the slide can be removed and the grate brought up to the bottom of the fire. It is claimed that the boiler will feed and burn buckwheat coal successfully and without constant attention. Circulars giving full particulars of this boiler can be secured on application. It is made in three sizes, with 15, 18 and 22 inch grates and rated to carry 300, 450 and 650 square feet of direct steam radiation.



The Torrid Fine Coal Boiler.

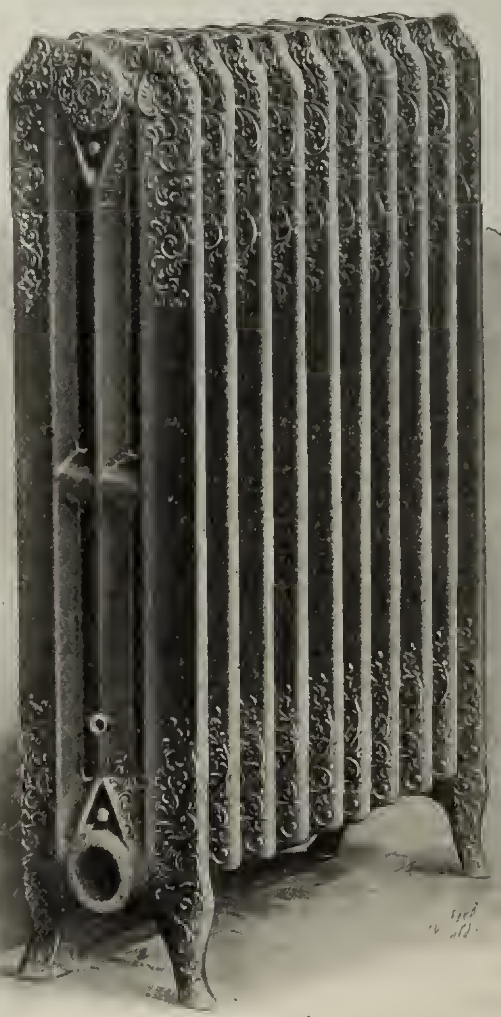
Feed Water Heater Catalogue.

The Whitlock Coil Pipe Company, Hartford, Conn., are issuing a very attractive catalogue of 30 pages devoted to the American Standard copper coil feed water heater. The first cover bears a design in black, green and gold on a dark background, and the catalogue is printed in two colors. Half-tone engravings show general views of the heater, and also the specially constructed coils of copper used in them and the method of connecting the steam supply with the coils through the shell of the heater. The heaters are made in 25 sizes, from 5 to 3000 horse-power capacity. The method of connecting the primary and auxiliary feed water heaters for condensing steam plants is shown by means of illustrations. The catalogue also contains a long list of those who are using the American feed water heaters, and gives the number of horse-power they are taking care of. The closing pages are devoted to useful information, showing the saving of fuel obtained when a good feed water heater is used. Accompanying the catalogue are two little circulars, one devoted to the American exhaust head and the other to the American steam separator.

The New York Radiator.

The latest candidate for the favor of the heating contractor in the radiator field is the New York radiator, made by the New York Radiator Company, Utica, N. Y., with branch office at 235 Water street, New York, and 79 Lake street, Chicago, Ill. The New York Radiator Company are erecting what they claim to be the most complete radiator plant in the United States at Utica, N. Y., for the manufacture of the entirely new line of steam and water radiation shown herewith. The patterns of the two and three column steam and water radiators are completed and radiators are now being constructed. The machinery for equipping the new plant is on the ground, and the new buildings, which are being substantially constructed of brick and iron, will be completed so that the plant will be in operation about July 1. The company state that they will be in a position to furnish two and three column radiation in all hights for steam and hot water, in ornamental and plain surface, in August.

In these radiators beauty of design has been combined with great strength and uniform thickness, giving full efficiency, together with the full amount of claimed surface, and in the three-column radiator the objectionable feature of unsightly bolts in plain view has been avoided. Having unlimited facilities for manufacturing, combined with the latest and most improved machinery, an ample and competent staff, under the supervision of an experienced radiator superintendent, the company are in a position to produce goods that will be attractive in design, ornamentation, construction and efficiency.



The New York Radiator.

Plumbers' Essay Committee's Request.

The following letter is being sent by M. W. Manwaring, 519 Washington avenue, Bridgeport, Conn., chairman of the Essay Committee of the National Association of Master Plumbers, to the officers of local and State associations:

Will you kindly solicit from your membership short essays upon subjects of interest to the National Association.

While not confining the writers to these, we would suggest as subjects the following:

1. Future of the master plumber.
2. Trusts, effect upon our trade (non-partisan from a business point of view).
3. Necessity of a more thorough organization of the trade.
4. How can our membership be increased ?
5. How should the plumbing business be conducted to be most successful ?
6. Is the present system of credits for the interest of the trade ?
7. Why is subcontracting detrimental to the plumber?
8. Why is the publishing of net prices and discounts hurtful ?
9. Is the present plan of organization of the National Association conducive to the best interests of all sections ?

If you can assist our committee in securing something to present to the coming convention at Atlantic City you will greatly oblige the committee.

Bathtubs for Royalty.

Royalty has come to Pittsburgh for her bathtubs and sanitary apparatus, says the *Times* of that city. The royalty includes Russia, Italy and England, and within the next few months the members of the royal families of the last two mentioned will take their baths in tubs made in Pittsburgh. The tubs will be the product of the Standard Sanitary Mfg. Company and altogether the orders amount to a considerable sum.

The order from Russia is for all the tubs, sanitary and operating room fittings that will be used in a maternity hospital that is being erected at St. Petersburg by the Empress of Russia. This hospital, which will be copied after the famous maternity hospital in New York, will be the most magnificent institution of its kind in the world, and its total cost will be over $1,000,000. The Empress is paying for it out of her private purse and sent her personal representative to this country to contract for the fittings. He was met in New York by Francis J. Torrance, who brought the contracts with him to Pittsburgh. The contracts are for tubs, showers, lavatories and fittings for the operating rooms, and all will be made of the finest porcelain enameled iron. The contract will amount to about $35,000.

The order from England is only a small one, but it will amount to a considerable sum. It is for six bathtubs that will be installed in Buckingham Palace, the home of King Edward VII, and they will be of the finest quality that the local company can produce.

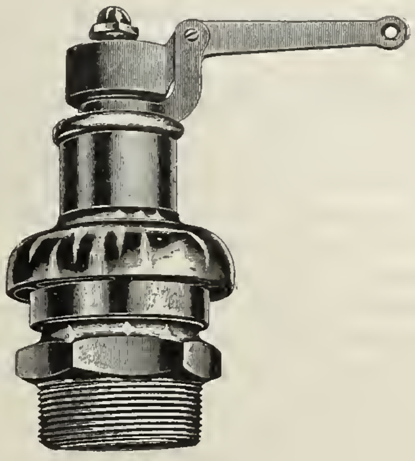
The order from Italy is a personal one from the King for five bathtubs. They are to be installed in the royal palace at Turin, and will also be of the finest quality. The three contracts will amount to nearly $50,000.

The National Radiator Company's Catalogue.

The first catalogue issued by the National Radiator Company of Johnstown, Pa., since they became the successors of the Fowler Radiator & Mfg. Company, has just come to hand. It is a very attractive piece of trade literature, and consists of 24 pages, bound in a dark green cover, upon which a design is worked including sections of the company's three-column Solus radiator. This radiator is made in two and three columns and with either high or low feet as desired. The catalogue shows cuts of radiators curved to suit bay windows, as well as window radiators, stair radiators and dining room radiators, with warming closet. The Solus is also made as a semidirect radiator, with a box base to suit, equipped with dampers for regulating the air supply. Several pages are devoted to the Imperial wall radiator, which can also be assembled as a low window radiator. The text fully explains their merits and gives the various hights in which the radiators are made and the sizes of air supplies best adapted for semidirect heating, and also the size of connections provided for both steam and hot water.

Safety Valves for House Heaters.

Having made a specialty of the construction of safety valves for house heaters, the American Steam Gauge & Valve Mfg. Company of Boston, Mass., have recently put on the market some new valves, shown herewith, which have met with favor from the manufacturers of boilers for house heating apparatus. In Fig. 1 is shown a new pop safety valve with a combined cap and top lever, constructed in the same manner as safety valves for high pressure, which is not usually the case with low pressure house heater safety valves. This valve discharges downward, preventing the dirt from lodging in the valve casing, although it can be made to discharge upward if preferred.



Safety Valves for House Heaters.—Fig. 1.—New Pop Safety Valve.

Fig. 2 gives a sectional view of another safety valve which is furnished without a lever and constructed on the same principles as high pressure safety valves, although it is not intended to work under higher pressure than 30 pounds. The construction and operation of this valve is readily noted from the sectional view presented. A large cap covered set screw at the top regulates the pressure at which it will blow off. Fig. 3 is a spring valve and not a pop valve, but it operates the same as the ball and lever safety valve which is now being discarded by some boiler houses. This valve is not so slow to open and closes quicker after relieving the boiler to a very small amount. This valve has been thoroughly tested by boiler manufacturers and has come to be preferred by a large number of them.

Tests on Heating with Radiators in Window Recesses.

BY CHARLES F. HAUSS.

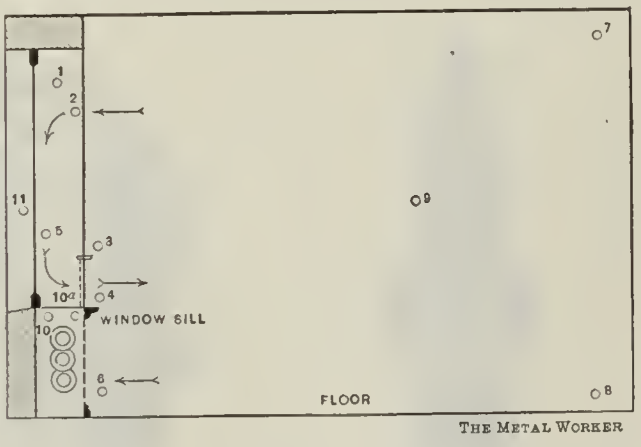
Some tests have recently been made to determine the temperature in different parts of a room heated by radiators set under the window seat to determine the necessity of using diaphragms or dampers to direct the current of heated air as it leaves the radiator and to know what direction the air currents travel in.

In cases where the radiator is placed near an inner wall the travel of the air is relatively simple. The heated air rises first to the ceiling, where it spreads, then falls at or near the cold walls, especially at the windows, where it drops to the floor, whence it returns to the radiator. Besides these main currents there are the lesser currents that diffuse the heat, bringing it in contract with the vertical currents near the center of the room, which under good conditions—that is, if the cooling surfaces are not too great—give a very small difference in temperature between the middle of the room and the surrounding walls.

Now there is another problem—namely, the setting of the radiators in the window recesses—which promises at the outset different air currents and distribution of heat. The setting of radiators under the windows is preferred in hot water or steam heating, in view of the fact that this is the wall space not needed for furniture of any kind, besides being the most rational place to set the radiator to prevent cold drafts from the windows. Little has been printed on this subject that would be instructive, hence the following tests made by Professor Esmarch of Göttingen * will surely interest the heating engineer.

The room in which the tests were made is of medium size, being 14 feet long, 16 feet deep and 12 feet high. It has two windows in the outside wall, which faces the east, the windows being 8 feet high and 4 feet 3 inches wide. The wall is of solid brick 18 inches thick. The three other walls divided this room from other heated spaces, hence any loss of temperature through them was improbable. Under this room was the kitchen, which was also heated, as was the room above, so that the loss of heat to these was cut of the question.

The conditions in this case can be looked upon as favorable, and the only losses to be considered are those through the windows, which were single sash with double glass—that is, the outer stained glass set in lead and the inner being plain glass, with a 5-16 inch air space between them.



THE METAL WORKER

Tests on Heating with Radiators in Window Recesses.—Fig. 1.—Elevation Showing Arrangement of Window Radiator and Thermometer.

The radiating surface was set as mentioned before in the window recesses, and was composed in each case of three lengths of gill pipe, or extended surface. The recesses were 53 inches long 8½ inches deep and 32 inches high, covered on top and front with perforated iron screening. The hot water with which the radiation was warmed seldom exceeded 158 degrees F., even in coldest weather, and ranged mostly between 120 and 140 degrees F.

The temperature was measured on ten standard thermometers, large enough to permit the easy reading of fractions of a degree, and were arranged as shown in Fig. 1 and as follows:

Thermometer.

1. Hung in the upper part of the window recess, and was separated from the room by a curtain 16 inches away.
2. In the middle of the window just under the curtain mentioned.
3. Was used only in test No. 4, and was set immediately above the draft shield, that was not used in the first three tests.
4. Just over the inner top edge of the casing or sill, the bulb being about 1¼ inches from same.
5. Was about 3¼ inches from the window and 16 inches above the window sill.
6. Before the recess, 1¼ inches over the floor.
7. In a corner of the room opposite to the window and 6 inches from the ceiling.
8. In a corner of the room opposite to the window and 1¼ inches from the ceiling.
9. In the middle of the room and about head high.
10. In the recess, close to the upper perforated screen and near the window.

10a. In the same horizontal line, but nearer to the room.

11. Just outside the window.

Finally the finer air currents were found with cigar smoke, which, when carefully used, will show them accurately enough for all practical purposes.

The first test was made on a clear, quiet, frosty day about 8.30 p.m. The heat had been turned off the radiator about an hour, yet the water in it was about lukewarm, as indicated by thermemeter 10 just over the radiation. Thermometers 4 and 5 record the lowest temperatures, for the reason that the cooled air of the room drops rapidly at the window, then passes out horizontally, as indicated by the arrow near thermometer 4, mixing with the warm air from the radiator as it returns to the middle of the room.

Most of the cooled air from the room naturally enters the radiator recess at the floor. Its velocity increases as the temperature of the radiator rises, which is also the case at thermometer 2, due possibly to the fact that the outside air was very cold. The air that streamed into the room horizontally at 4 feet could be followed with smoke distinctly about 3 feet, when it seemed to dissolve into numberless smaller streams that could not be traced. This, of course, holds good only when there is no wind. When there is strong wind blowing this horizontal stream can be distinctly traced about 7 feet. Otherwise the circulation of air in the room is generally the same in all the tests—that is, a more or less rapid travel of the air into the recess at top and bottom—a mixing of the two differently tempered streams of air immediately over the radiator, and then a horizontal return into the room, with more or less rapid mixing of the air in the room. A remarkable thing is the evenness of the temperature of the room in its different parts, in horizontal as well as vertical direction. Except for the low temperature shown at the window and the high temperature shown just over the radiator, the different thermometers vary hardly more than 2 to 4 degrees, whether they are near to or far from the windows, on the floor, head high or near the ceiling. This result must be credited partly to the protected location of the room, partly to the low temperature of the source of heat, and, finally, to the excellent location of the radiator.

After the temperatures were recorded the heat was turned on the radiator, and at the same time the rolling outside shutters were closed. Naturally this protected the windows from cold, and thermometer 11 on the outside at once showed a rise from 8.6 to 21.2 degrees F. Despite the strong wind blowing when the second test was made this same rise occurred in thermometer 11. After one hour of heating the temperatures were taken again. The effect of the heating was plainly apparent, as every thermometer showed a rise, especially thermometers 10 and 10a. The fact that thermometer 10 showed lower than thermometer 10a was explained by the smoke from the cigar, which in descending at the window did not all turn out horizontally, but part of it forced its way through the top screen. This current of air was distinctly traceable in all the tests. It may be well to remark here about the stagnant warm air

---

*For the *Gesundheits Ingenieur*, No. 18, 1901.

around thermometer 1, which was only separated from the room by a cloth curtain.

The third record of temperature was taken 35 minutes later, but outside of a small increase in warmth there was no change from the record shown in test 1b in Table A.

Table B.

	d	10.30 p.m.	70	70	68	..	65.6	67	71.6	68	70	65.6	66.2	43.6

A second test was made on the following morning at 10 o'clock, when a brisk east wind was blowing hard directly on the windows. The outside temperature was 12.2 degrees F., hence the loss of heat through the windows must have been much higher than on the night before.

The radiator valve was about half open, the temperature of the radiator 122 degrees F. The circulation of air as indicated by the cigar smoke was precisely the same as in the first test except that it was more rapid, and was noticeable about 5 feet from the window, in the form of a draft, which was much reduced by placing a tightly rolled cloth at the bottom of the warped and poorly fitted window, when also the temperature of thermometer 4 increased 11 degrees F. The second reading of the thermometers was taken at 10 o'clock p.m., after the aforementioned roller shutters had been closed.

The radiator valve was not changed, but the water temperature increased considerably, which naturally increased the velocity of the air, which is best illustrated by the high temperatures of thermometers 5 and 6.

The third test was made one week later. There was no wind blowing, outside temperature 35.6 degrees F., and the radiator valve practically closed and radiator just lukewarm. Only a small amount of air enters the recess at thermometer 6, and leaves at thermometers 10 and 10a, at which the temperature was alike.

Otherwise there is the same circulation of air as in the former tests. The horizontal current could be traced with the smoke about 4½ feet into the room, and can be felt equally as far, due possibly to the lack of hot air being added, as indicated on thermometer 4. Now the heat was again turned on, and after one-half an hour the result was read off, as shown in Table A, at 3b. After another hour the results shown in 3c were recorded, which are about the same as those shown in the previous tests.

The appearance of draft mentioned suggested the use of a shield or protector, so a glass window shield about 24 inches high was placed just in front of the top screen of the radiator casing or sill, which was about 12 inches from the sash and closely fitted the window casings at the sides. This shield is shown in Fig. 2, and answered the purpose of stopping the drafts.

The fourth test was made in thawing weather with a light southerly wind blowing, after the heat had been turned off the radiator for some time. With the use of the shield it was found that the cold air dropping at the windows passed all the way through the radiator recess when the heat was turned off and passed out onto the floor, as was plainly shown in the temperatures of thermometers 5 and 10 in test 4, which was made at 4.45 p.m.

A second reading was made one and three-quarters hours later, and at the same time the radiator valve was opened and the shutters closed. After another hour the third reading followed, which showed that the direction of the air currents had changed, but I refer to the last test for a clearer explanation of this. After the third reading, 4c, was taken the radiator valve was closed again, and after three hours, the radiator being cold, the cooler air that descended at the windows again passed through the radiator recess and out upon the floor, as mentioned at the beginning of test 4.

Finally, a last test was made with the shield, as shown in Table B and Fig. 2, when only six thermometers were used and placed as shown in Fig. 2. Besides this a diaphragm of cardboard 18 inches high was fitted into the window recess so as to evenly divide the space between the shield and the window, the top of this diaphragm being level with the top of the shield, leaving 6 inches between the bottom of the diaphragm and the window sill.

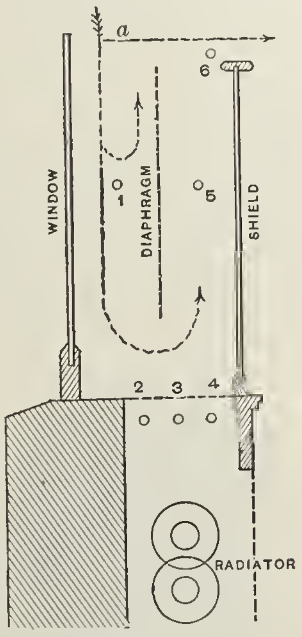

Fig. 2.—Window Arranged with Shield.

The object of this is plain, to induce the cold descending air to drop to the radiator and be carried back with the ascending current of warm air on the inner side of the diaphragm past thermometer 5 in Fig. 2.

The test was made on a frosty day, very little wind and outside temperature 28 degrees F. Heat was turned off and the temperatures were read, then heat was again turned on, and the four other readings shown in Table B were taken.

Smoke blown against the window showed that soon after turning on the heat there was a lively current rising up past thermometer 5 that mixed with some of the cold air *a* at thermometer 6 and passed in a slightly rising horizontal line into the room over the shield, yet there was no draft felt even near the windows.

Of the air dropping toward thermometer 1 about one-half went as described toward 6, the remainder went on down toward the sill, where part of it went up past 5; the rest in the process of mixing with the rising warm air returned up channel 1, as indicated on Fig. 2.

When the diaphragm was shifted to within 2¾ inches of the window all the air that reached the channel in which thermometer 1 was placed continued on down to the sill and came up again in channel 5, but the parting at *a* and the current that passed horizontally at 6 continued.

When the diaphragm was removed smoke tests showed that the most of the cold air dropped to the sill, then turned and rose past thermometer 5 and mixed with the rising warm air. The diaphragm apparently was of no benefit, at least not under the conditions of this test.

In conclusion it may be well to remark, tersely, as follows: A hot water radiator set in the window recess will, even under the worst conditions, give entire satisfaction, as evidenced by the remarkably even temperature in all parts of the room. The circulation of air in the room is different than in hot air or stove heating, in that there is an energetic mixing of the cold with the warm air in the recess, and an entire absence of a cold zone on the floor. The appearance of draft on a level with the window sill can be avoided by the use of the shield mentioned, or where the windows are either double sash or especially tight single ones there need be no sign of draft from this source. Any special direction of the air currents by diaphragms seems unnecessary.

Noppel Force and Suction Pump.

Noppel Pump Company, Hartford Trust Company Building, Hartford, Conn., are manufacturing the Noppel plumbers' pump, here illustrated. Fig. 1 shows one form of the pump, Fig. 2 representing a similar pump, but with additional features by which to accomplish similar results in other ways. These pumps are designed for clearing out obstructions of grease or other impediments in pipes connected with sinks, basins, bathtubs, closets, urinals, &c., without scratching or otherwise marring the fittings. In cleaning out obstructions in the waste pipes referred to no connection is needed other than to screw onto the neck of pump a suction cup provided for that purpose and place the cup over the outlet of the bowl, holding it there firmly. The water should be allowed to run into the basin until it covers the other opening in the pump (see Fig. 1), at the bottom of the right hand side. The handle of the pump should then be turned to the left as far as it will go and pulled up. This fills the pump cylinder from the water in the basin. The handle should then be turned to the right as far as it will go and forced down and pulling it up as far as possible, keeping the handle turned to the right. This forces the water drawn from the basin against the obstruction and sucks it out again. After a few strokes the handle can be stopped at the end of the upward stroke, when the handle can be turned to the left as far as it will go and pushed down, thus discharging what has previously been drawn up. There should then be taken in a fresh supply of water or solution of chlorate of lime, which acts as a solvent with grease, and pulling the handle up again, turn to the right as far as it will go and renew pumping up and down vigorously. It is said that it is seldom necessary to repeat the operation, as usually by this time the obstruction has been opened up so that the water the operator is pumping in is running through the pipe before it can be drawn back again. Where it is necessary to exert more force the suction cup can be taken off and put on the neck of the pump, on which it is screwed through the hole in the foot rest, and the pump fastened with the nut provided. The brass nipple is then screwed on and a rubber hose long enough to reach from the pump to the outlet in the basin attached. On the other end of the hose can be fitted the male nipple, to which should be screwed the cup. A short hose connected with the opening in the base of the pump should be allowed to lie in a pail holding the water or solution and standing conveniently near, as illustrated in Fig. 2. The pump is then ready for operation as before, but without the necessity of filling the bowl or basin with water, although if the pipe is completely clogged it is always advisable to allow the water in the faucet to run until the pipe is filled from the obstruction to the intake. When it is more convenient to operate on the end of the pipe or some part of the plumbing other than the waste pipe entrance the operation is the same as last described, but one of the rubber plugs which are furnished, fitting pipes from ¾ inch to 3 inches in diameter, is screwed onto the male nipple in place of the cup and forced into the opening to make a tight joint. It will thus be seen that this pump acts both for force and suction work.

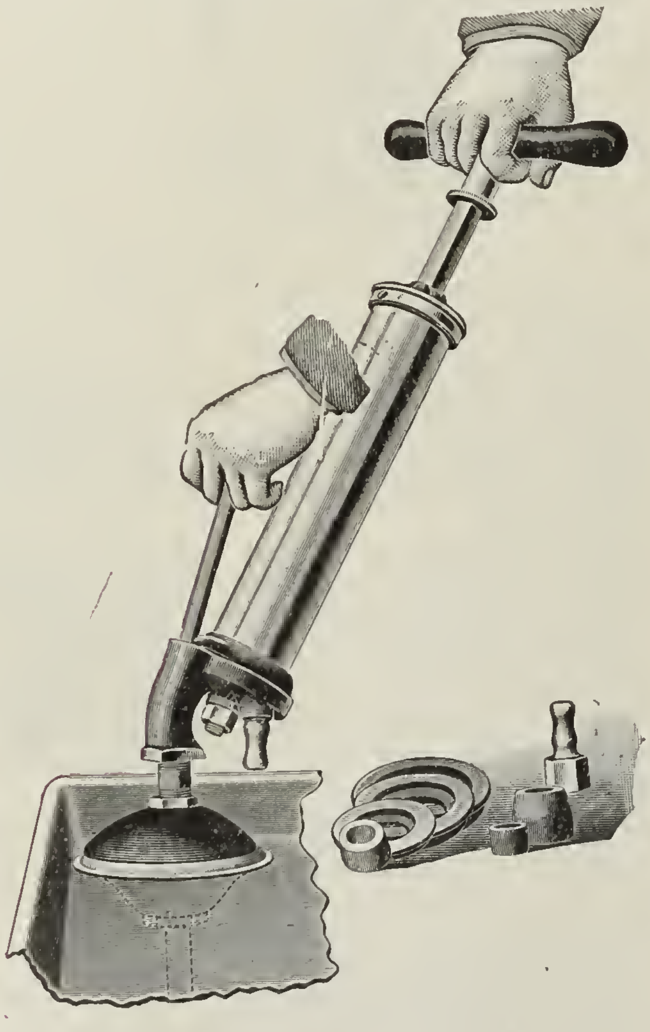

Fig. 1.—Noppel Force and Suction Pump.

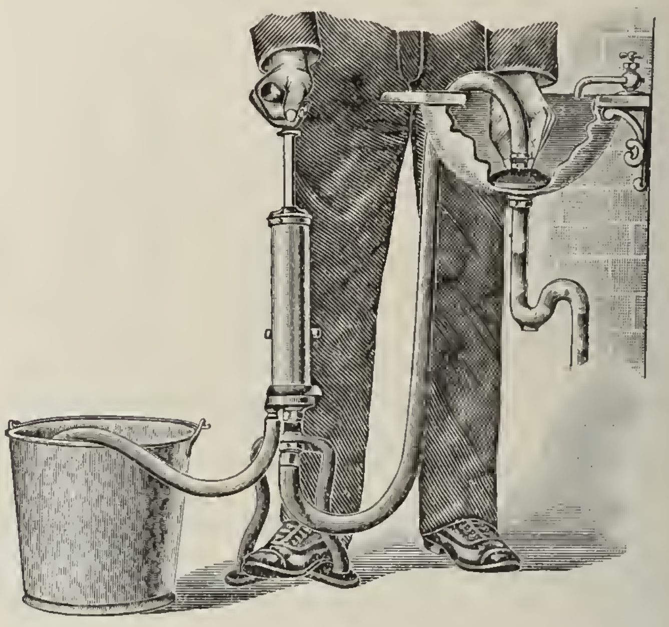

Fig. 2.—Another Method of Using the Pump.

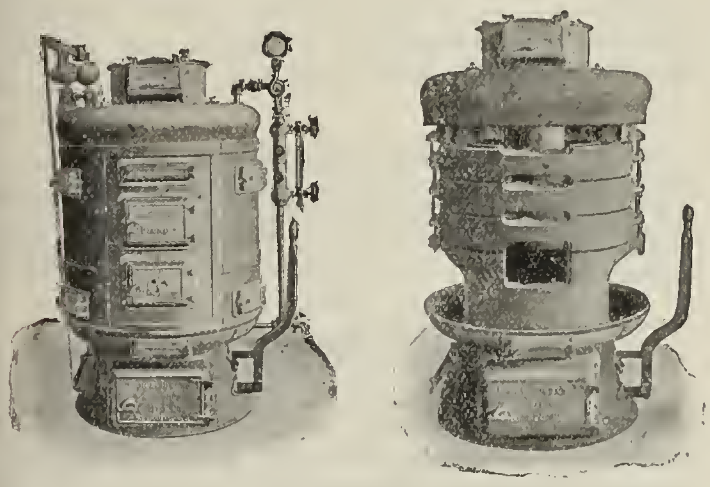
The Vance Boiler Works, Geneva, N. Y., are now occupying the new plant which they have built for their special purposes. The works are located at Gates avenue and Ontario street, and are close to the tracks of the New York Central and Lehigh Valley railroads. The main building is 50 x 200 feet, two stories high, constructed of wood and brick, and will be used for machine and boiler shops. A fine equipment of machinery, which includes a compressed air plant for riveting, power presses, &c., is being installed. A warehouse connected with the main building is in process of erection. Office facilities, conveniently provided in the main building, are ample for the requirements of a largely increased sale of the Vance Boiler. An area of 2 acres is comprised in the site purchased by the Vance Boiler Works, and will be ample for future extension as that becomes desirable and necessary.

The Improved Florida Boiler.

The Pierce, Butler & Pierce Mfg. Company of Syracuse, N. Y., are now placing on the market the Improved Florida boiler, shown in the accompanying illustration. This boiler is constructed of horizontal sections and is circular in form, having a magazine feed directly over the center of the fire. Each section is provided with corrugations and projections to increase the heating surface and extending almost to the magazine, which is a separate casting, so that every portion of the water section is entirely surrounded by hot gases. The construction provides four return flues and three waterway openings, the different sections being connected by extra heavy cast iron push nipples. The fire pot section is smaller in diameter than the water sections which rest upon it. The fire varies from 10 to 15 inches in depth, according to the size of the boiler, and the fuel slopes from the magazine toward the sides. The base is of ample hight to allow a free circulation of air under the grate and to accommodate a quantity of ashes. It is provided with a draft door adapted for connection with an automatic damper regulator, and it supports a grate constructed with interlocking bars and so arranged that it may be dumped. A cast iron casing is provided to insure the durability of these boilers.



The Improved Florida Boiler.

When this boiler is arranged for hot water heating it is designated as the Improved Tropic, and is identical in construction with the Improved Florida, except that the waterways are considerably larger. The boilers are made in 15 sizes, with fire pots ranging from 16 to 32 inches in diameter. They are rated to carry from 250 to 1250 square feet of direct steam radiation, and from 400 to 2075 square feet of direct hot water radiation.

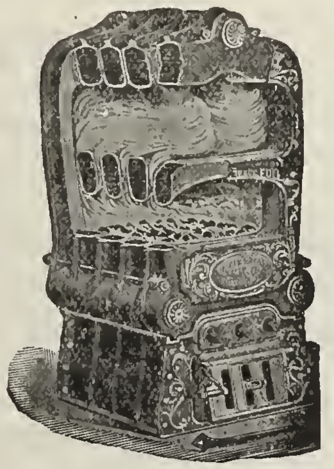
Capitol Boilers.

The United States Heater Company of Detroit, Mich., with branch offices in New York, Chicago and Philadelphia, are sending to the trade a handsome edition of a catalogue devoted to the Capitol boilers. The work is printed on fine paper, bound in a green cover with a red silk cord, and has a picture of the National Capitol with the words " Capitol Boilers " on the front page. A view of the manufacturing plant of the company is given as a frontispiece and the introduction calls attention to the "98 Series" of Heavy Duty Capitol boilers, which are of the vertical sectional type, with an auxiliary crown sheet exposing a large amount of fire surface. The flues are so arranged as to secure a long fire travel, and the sections are connected by means of cast iron slip nipples. The waterways are arranged to facilitate circulation and allow the steam generated to pass to a steam drum without hindrance, so that dry steam is provided.

The hot water boiler is of the same general construction except that the top header is much shallower. The boilers are shown both in general views and by means of broken views, so that the construction and fire travel can be readily understood. Pictures of the different sections and also of the grate and ash pit are presented. Two pages are devoted to tables showing that these boilers are made in 14 sizes adapted for hard and soft coal or wood, and rated to carry from 350 to 2750 square feet of steam radiation. Accompanying the catalogue is a four-page circular devoted to the Capitol-Mascot, a boiler which has been on the market for a number of years and has gained a popular reputation.

The New Walker Boiler.

The accompanying illustration presents a broken view of the new Walker boiler, made by the Walker & Pratt Mfg. Company, 31-35 Union street, Boston, Mass. This boiler is of the vertical sectional type, having an auxiliary crown sheet exposing a large amount of surface to the direct radiant heat of the fire. The construction also provides for a long fire travel before the burning gases find their escape to the chimney. The waterways in the boiler are arranged to facilitate a free circulation and to permit the ready liberation of the steam generated from the water, so that dry steam may be supplied to the heating mains. The sections are connected by means of malleable iron tapered push nipples, which are copper coated. The copper coating forms a slightly yielding surface which conforms exactly to the accurately reamed holes in the sections, making a tight joint and affording protection. The different sections, when assembled, are designed to rest on a substantial base in which a labor saving grate is provided, either of the triplex character or of the rocking type. The boilers are made with 17, 22 and 32 inch fire boxes, and in 21 sizes, rated to carry from 400 to 4500 square feet of direct hot water radiation and from 240 to 2700 square feet of direct steam radiation. It is claimed by the makers that all boilers are thoroughly tested under a pressure of 100 pounds, and also that the ratings may be relied upon. In using the ratings, the flow and return pipes of heating systems must be considered as radiating surface. The company issue a new catalogue of 12 pages, devoted to a detailed explanation and giving tables of the dimensions of this boiler.



The New Walker Boiler.

The United States Radiator Company's Expansion.

At a meeting of the Executive Committee of the United States Radiator Company, Dunkirk, N. Y., it was decided to build a second plant, equal in size to the present one, which is now yearly paying out $150,000 in wages, shipping 2400 carloads of radiators and melting 14,000 tons of iron. At present 267 men are employed. Fully 100 more would be engaged if they could find homes in Dunkirk, but there are no more houses.

Three cities, besides Dunkirk, are working for the new plant. As all the available ground on the present site is taken, the duplicate plant must be built on a lot in another part of Dunkirk if that city is to have it. Whether or not the new plant is built there near the present one remains to be seen.

Seaman & Merkle, Fleetwood, Pa., have added a plumbing branch to their business. They have a number of contracts in hand.

ASSOCIATION NEWS.

Tennessee Master Plumbers.

The annual convention of the Tennessee Association of Master Plumbers was held at the Tulane Hotel, Nashville, Tenn., on May 10. After transacting the regular business of the association the following officers were elected for the ensuing year:

President, Fred. Fox., Jr., Chattanooga.
Secretary, R. O. Carlin, Chattanooga.
Treasurer, P. J. Kane, Nashville.
Delegates to the National Convention, Thomas J. Mooney and P. J. Kane.

The delegates were entertained by a dinner and theater party.

New Haven Master Plumbers.

The Master Plumbers' Association of New Haven, Conn., at their annual meeting on Monday evening, May 12, elected the following officers for the ensuing year:

President, C. E. Coe.
Vice-President, Thomas L. Routh.
Corresponding Secretary, H. B. Bushnell.
Recording Secretary, J. F. Campbell.
Financial Secretary, E. R. Tierney.
Treasurer, T. W. Corbett.
Sergeant-at-Arms, C. E. Coe.
Delegates to the National Convention, P. F. Connelly, S. E. Dibble and T. W. Corbett.

The association now numbers between 35 and 40 members, with a number of applications under consideration, and is in better condition than it has been for several years.

At a meeting of the Master Plumbers' Association of East St. Louis, Ill., T. J. Kickham, William Thrasher and F. G. Turner were elected delegates to represent the East St. Louis Association in the National Convention, which meets in Atlantic City in June.

Already there is evidence that Atlantic City is to prove a popular convention city so far as the master plumbers are concerned. Advices from Milwaukee are to the effect that Treasurer W. E. Goodman will head a delegation from Milwaukee, consisting of between 30 and 40 members.

New York City Notes.

The trade were shocked to learn of the death last Saturday of Samuel L. Malcolm, ex-president of the National Association and of the New York local. Mr. Malcolm attended a meeting of the Manhattan Branch National Delegates on Friday afternoon, and several remarked as to how well he looked. Acute indigestion was the cause of his death. He came to New York from Pittsfield, Mass., in 1858. and worked for Elias Hatfield at 144 Broad street, carrying the bag for James Nugent, who is now in business at 214 Grand street. At the outbreak of the Civil War he enlisted in Company C of the celebrated "Hawkins Zouaves," Ninth New York Volunteers, and served the four years of the war. He was familiarly known as the "Little Sergeant." In 1894 he delivered the oration at the unveiling of the Zouaves' Monument at the battle-field of Antietam. Mr. Malcolm's history in association matters is well known to all, and those who have had dealings with him can well describe his character in the words of Lincoln: "With malice toward none and charity for all." The funeral services held from his late residence, 313 West 112th street, last Tuesday evening, were largely attended by the trade. Among those attending and who went to the burial at Greenwood on Wednesday were National Executive Committeeman Thos. F. Gaynor and ex-National President Patrick Tierney of Providence, R. I.

* * *

Trade is still picking up, and all will be busy when the different jobs lately given out get well under way. James Armstrong is plumbing the new Woman's Hotel, running from Twenty-ninth to Thirtieth streets, between Madison and Fourth avenues. Reynolds & McMahon have a large apartment house, 60 x 86 feet, on 141st street near Seventh avenue. Alex. Cameron is building and plumbing four apartments on 107th street near Manhattan avenue. J. F. Boyle has an apartment and restaurant at the corner of Columbus avenue and Seventy-fourth street. P. Lauria of 244 Mott street is plumbing four flats on Fourteenth street west of Second avenue. Geo. Dellon has tenements at 210 to 214 Cherry street and at 64 and 66 Avenue C. B. A. Buge has tenements at 8 to 12 Jones street. J. Berliner is doing two tenements at 334 and 336 West Fifty-third street. Louis Kayfetz has two tenements at 61 and 63 Perry street. M. A. Belford of Brooklyn is doing the work in a new gas house on Sixty-sixth street west of West End avenue.

* * *

The Law Committee of Manhattan Branch are actively at work in the matter of unlicensed plumbers, and have reported many to the Bureau of Buildings. Many of those not caught at work have been compelled to take in their signs.

Heating and Plumbing Notes.

The Homestead Valve Company, who recently removed from Pittsburgh to Homestead, Pa., have purchased a tract of land, 100 x 200 feet, adjoining their plant, on which they will erect a brass foundry and iron casting department. It is reported that the company will shortly place a new Valve on the market.

Bids will be received at Fort Riley, Kan., until June 10 for plumbing and heating several buildings at that place.

C. W. McKeehan has formed a partnership in the plumbing business with Mr. Pugh, at Columbus, Ohio.

R. V. Edel, heating engineer, informs us that he has removed his office to 366 West Broadway, New York, where he has better facilities for making plans for heating buildings with steam and hot water, and solicits patronage from architects, steam fitters and boiler houses.

The City Property Committee of Springfield, Mass., have awarded the contract for heating apparatus for the new Glenwood School to Z. C. Clapp, who bid $1397.

James Harris, a well-known heating engineer and contractor of Hartford, Conn., is now located at 548 Asylum street, where he has spacious quarters in which to conduct his growing business. Mr. Harris was for many years located on Ford street and is well known throughout the city and vicinity, having filled a large number of important contracts. Aside from steam and hot water heating, he also does a plumbing and gas fitting business.

The W. D. Allen Mfg. Company, 151 Lake street, Chicago, Ill., send us a copy of their 1902 catalogue, No. 16, devoted to Leather Belting, Piston Packing and Specialties in Mill Supplies. The catalogue is furnished with a well arranged index. The first section refers to Leather Belting and all the supplies and apparatus used in connection with it. Spray Nozzles, Lawn Sprinklers, Hose Couplings and Menders, Branch Pipe and Hose occupy another section of the book, followed by Hose Spanners and a complete line of Fittings and Valves, with Branch Pipes for Fire Department use, or for installation of fire fighting equipment in factory buildings. including Hose Racks and Hose Reels. Water Back Couplings and Grease and Oil Cups in great variety form a line of Brass Goods. The last section of the catalogue is devoted to Packing of various kinds.

The new Board of Plumbing Inspectors at Grand Rapids, Mich., is composed of Health Officer Koon, City Engineer Anderson, Harry Thompson, William Robertson and William H. Vanderveer. One of the first actions of the board after organization was to examine the list of registered plumbers and notify those who had neglected to take out a license to procure one at once, or cease work.

Irving Knowlton of Canajoharie, N. Y., has arranged to provide the Methodist Church in that city with a steam heating apparatus at a cost of about $1000, upon which he will draw interest at 4 per cent. as long as he lives, the obligation to be canceled by his death.

The Ohio Brass Company, Mansfield, Ohio, issue a little catalogue devoted to high grade Brass Goods for engine builders' and steam and hot water fitters' use. The introduction states that the goods are well proportioned, extra heavy, of fine finish and of the best quality of workmanship, as well as thoroughly tested before shipment. The catalogue also shows Radiator Valves, Union Elbows, Globe Valves, Gate Valves and Check Valves. The Chicago Heater & Supply Company, 33 Dearborn street, Chicago, are the company's Western agents.

Frank T. Bassett of the Boston office of the American Radiator Company, was a visitor in New York this week.

A. H. Ferguson, Coronado, Cal., informs us that he has the contract for installing the plumbing system in an addition to the Southern California Hospital for the Insane at San Diego. He reports that the plumbing business all along the coast is very active at this time.

A new heating and electric lighting plant will be installed in the Ohio State Institute for the Blind at Columbus, Ohio. Stribling & Lum of that city are preparing plans for the improvements.

The Crane Company, Chicago, manufacturers of Wrought Pipe, Valves and Fittings, have recently established branches at the following cities and under the following names: Crane & Ordway Company, Duluth, C. A. Payne, manager; Crane Company, Seattle, L. B. Peeples, manager; Crane Company, Salt Lake City, Wm. Bowen, manager. A full line of Plumbers' and Steam Fitters' Supplies, in addition to the Crane Company's products, will be carried at all these branches.

The latest improvement made in the Forbes Die Stocks, manufactured by the Curtis & Curtis Company, Bridgeport, Conn., has had the effect of increasing their popularity. It consists in the adjustment of the shell, or casing, so that the wear of the gear may be taken up. In many machines for cutting and threading pipe, the gear wears itself loose in the shell after a time, so that a perfectly straight thread is not easily obtained. This difficulty is said to be wholly overcome in the present Forbes Die and Stock. The Dies used are cheaper than solid Dies and much more durable. All parts of the machine are interchangeable.

J. N. Wilkinson, president of the Board of Regents of the State Normal School at Emporia, Kan., will receive bids until June 2 for heating and ventilating a new library building in that city.

L. A. McGuigan, Davis, W. Va., bid $3456 and secured the contract for plumbing and heating the new Geisberger Hotel at Thomas, W. Va., and will use for the purpose two large size Model Steam Boilers and 3236 square feet of radiation.

Frank C. McLain is sending to the trade an announcement of the removal of his office from Thirty-eighth street and Eleventh avenue to 1123 Broadway, New York, with telephone No. 235 Madison square. Mr. McLain states that he will confine himself exclusively to the sale of Steam and Hot Water Boilers, Radiators, Tanks and Supplies, and solicits the patronage of the heating trade.

The Buffalo Forge Company, Buffalo, N. Y., are sending out a mailing card showing a yachting scene with the title, "You Can Keep Cool at Home." On the reverse side are presented cuts of several styles of the Buffalo Disk Wheels for ventilating, cooling, drying and for removing odors, fumes, smoke, dust and steam from buildings.

Within a few weeks the new catalogue "H" of the Kellogg-Mackay-Cameron Company, Chicago, will be issued. Indicative of the great strides this progressive company have made in the last few years, it will be a book complete in every detail and devoted to Steam and Hot Water Heating Apparatus. The illustrations have all been carefully selected, and the text, tables and lists are condensed and revised with the aim to make the book most conveniently arranged and most easy to use. There is not an appliance, piece of apparatus or part of the "machinery" needed by the steam fitter or contractor in his work that is not shown therein in its most improved pattern. The heating man will find this book, of something over 350 pages, of great use as a reference book, but should he look further into the matter, which it is the aim of the company he should, the claim is made that he will find the corresponding prices to his great advantage to investigate. A copy will be sent on request, in rotation as requests are received.

One in three is about all the games that Captain Emery can inspire the Plumbing and Steam Supply League team to win in the Business Men's Championship Tournament. But then every team cannot win, and the "boys" are getting lots of enjoyment out of the contests just the same. Ex-President Haff is rendering effective service, and A. E. Good has proved a good help in offsetting the "breaks" made.

The J. L. Mott Iron Works are issuing from their uptown showrooms at 110 Fifth avenue, New York, a very tasteful invitation to visit and examine one of the handsomest exhibitions of modern elegance in bathroom equipment and sanitary goods that has ever been arranged. There are several features of notable interest, and benefit will be derived by an examination of the display.

In order that the plumber may not, through oversight, neglect to arrange to attend the convention of the National Association of Master Plumbers, President Hornbrook has prepared a blotting pad printed in red and blue calling special attention to the "Cleveland Resolutions," which are represented as on the way to Atlantic City, N. J., in an automobile, and inviting all plumbers to get into line in support of the principle of trade protection.

George Genshart has moved his plumbing and tinsmithing business into a fine new store at East Mauch Chunk, Pa.

New Firms and Changes.

The Keystone Valve & Mfg. Company, recently incorporated at Pittsburgh, Pa., with a capital of $100,000, will, it is reported, shortly secure a site for a plant whereon they will build a factory for the manufacture of all kinds of Valves, having an initial capacity of 100 Valves a day, among them being a newly designed Steel Valve patented by Henry E. Keyes of Homestead, Pa. The incorporators of the company are J. B. Riley, William A. Larimer, William R. McCulley, William J. Simpson and Stephen Mackay. The Board of Directors includes the above incorporators together with John A. Logan, E. A. Griffith, N. H. Schooley and Hugh McCulley.

The Nashville Steam Heating Company have been incorporated at Nashville, Tenn., with J. P. Gray, president, and W. L. Horn, secretary, to erect a $5000 steam heating plant to furnish steam heat to dwelling houses, stores and offices.

The Hub Supply Company have been incorporated at Kittery, Maine, with a capital stock of $10,000 to deal in Plumbers' Supplies, &c. The president is Horace Mitchell and the treasurer A. M. Meloon.

The Standard Plumbing & Contracting Company, 51 Newark street, Hoboken, N. J., have been incorporated for the purpose of manufacturing Plumbers' Specialties. The capital is $3000, and the incorporators are Harry Salvator, John J. Weller and Julius Lichtenstein.

J. R. Croot will open a plumbing shop at 22 Macon street, Summit, N. J.

The Butler Mfg. Company, Butler, Mo., having a paid up capital of $12,000, have been incorporated to manufacture Plumbers' Supplies. The stock is held as follows: Charles R. Butler, 26 shares; Kate M. Butler, 3; N. W. Butler, Hydor, Ok., 100; E. E. Norquist, 21.

Henry H. Fairchild succeeds the plumbing and house furnishing goods house of Fairchild & Oliver at Morristown, N. J., Charles C. Oliver withdrawing from active business life.

SUCCESSFUL SIGN ADVERTISING.

On different occasions we have presented half-tone engravings of the business establishment of J. T. Henshaw & Co., 736 Thirteenth street, N. W., Washington, D. C., and called attention to his unique method of advertising. Mr. Henshaw's place of business is passed daily by a large number of the citizens of Washington, and he calls their attention to his specialties by means of written signs, some on blackboards and some on paper. Mr Henshaw is not only something of an artist with the crayon, using different colors to write his advertising phrases, but also possess no small amount of talent in originating striking sentences which impress the memory of the readers in a manner which he has found to be profitable to his business. In a letter recently received from Mr. Henshaw he says: "Almost a decade has passed since I mailed you my first photograph, and now, after ten years of prosperity, I favor you with a second edition. I still pursue my original method of advertising and am more firmly rooted than ever in the good graces of a lucrative patronage. I thank *The Metal Worker* for having much to do with the thoroughness of my mechanical training."

The photograph mentioned shows, at the top of the building, an immense sheet metal teapot, and beside it an ornamented chimney top. On the front of the building there are nine signs, all written in white chalk on blackboards. It is said that many people pass a few blocks out of their way to read Mr. Henshaw's signs. These, at times, treat not only of what is occupying the national attention, but of fashion as well, and he makes them the occasion to draw attention to his own business. One of these signs reads as follows: "If the American girl will draw about herself the cloak of respectability as tightly as she does her skirts, even the corner loafer will protect her honor with his life." Another says: "The pleased customer comes back again." Others run as follows: "Come, let us reason together; don't that old roof need painting or repairing?" "Is your furnace out of order?" "Does your fire place heater fail to operate?" "Is not something wrong with the range?" "Leave your order with us, and all will be made promptly and thoroughly right." Another states, "We have a scrupulous regard for good work and offer you nothing but the best material and the best workmanship." Still another says: "By persistent endeavor we have attracted the notice and patronage of many substantial people; by honest and efficient work we held their confidence and retain their trade." These are a few of the ideas that have been presented on Mr. Henshaw's signs, and they are reproduced as suggestions for others, who can doubtless follow the example which he has set with advantage to their business.

Burton's Felt and Burlap Asphalt Roofing.

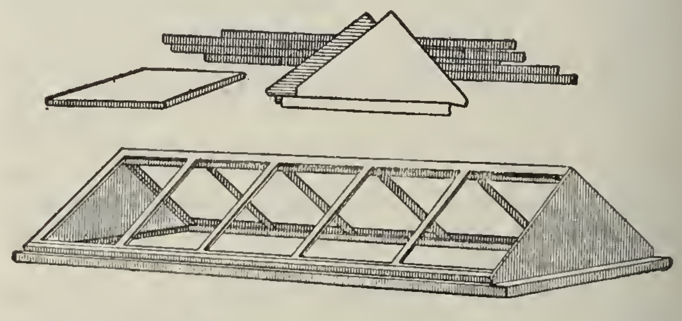
W. J. Burton & Co., 160-166 West Larned street, Detroit, Mich., are sending out a little circular in the interest of Burton's felt and burlap asphalt roofing. This roofing is composed of a layer of 15-pound asphalt saturated felt, on which is imposed a layer of asphalt. This again is covered with Calcutta burlap saturated with asphalt, another layer of asphalt being again placed upon it, and the whole being covered on the top with fine screened and washed gravel. This roofing is made by improved machinery and its advantages over the old style of composition roofing is that in place of tarred paper, heavy asphalt saturated wool felt is used, and instead of another layer of tarred paper a thick layer of pure asphalt. Where, in most roofing of this kind, tar is mopped on by hand, thick in some places and thin in others, the asphalt in the Burton roofing is spread by machinery, which is claimed to give a thick, even coat, and the gravel is rolled in by machinery, so that it becomes absolutely a part of the roofing and is not readily detached. The roofing is made and shipped in rolls 32 inches wide and 41 feet 4 inches long. It is guaranteed on roofs of one-half pitch and can be easily and quickly laid, forming invisible seams. The roofing can be laid over shingles, tin, tarred paper, &c., and it is claimed to be warm in winter and cool in summer. It is also adapted for use for gutters and flashings, and is said to have remarkable fire resisting qualities. An evidence of its durability is found in the fact that Burton's roofing has been in use as step pads on the stairs of Chicago Elevated Railroad stations for several years and is still in good condition. The company furnish, without extra charge, for each square, 1 pound of nails and 1 gallon of asphalt cement for laps. They also give each customer a knife for cutting the roofing and a brush for applying the cement to the laps. The manufacturers state that over 400,000 squares of this roofing is in use by the United States Government, State and city governments, railroads, manufacturing companies, corporations and private individuals all over the country.

Robert Jahn.

Through an unfortunate accident Robert Jahn, who is well known to the sheet metal working trade in the vicinity of New York, met his death in the early part of May. Mr. Jahn conducted a cornice making establishment at Scotch Plains, N. J. In the evening he went to the building in which he stored his paints and materials, with a five-year-old son, who carried a light. Through an explosion both lost their lives. Mr. Jahn, who was a German and learned his trade in Germany, was not only a fine workman, but a thorough master of his business, having designed and constructed the cornices of some of the finest buildings in the vicinity of New York City. He is survived by his widow and several children.

New Galesburg Metal Skylight

The Galesburg Cornice Works, Galesburg, Ill., are making the new metal skylight of which illustrations showing the fitting in parts and set up are presented herewith. This skylight has the advantage that it can be shipped "knocked down," with a bundle of bars and a box of glass. It can be handily transported in this condition to the required position on a roof all ready to be set up on the curb without any tools but a hammer. No cutting or soldering and no putty are needed, everything being made to fit into place on the curb. It is claimed that one of these skylights can be put on a curb on a roof, ready for the glass, in ten minutes, and in ten minutes more can be completed with glass in position. These skylights are made complete, with glass, in six sizes—namely, 3 x 4, 3 x 6, 4 x 6, 4 x 8, 5 x 10 and 6 x 8 feet. Where required, they can also be made with louver ventilators in the ends. The company make all styles of metal skylights, but claim that this pattern is the acme of devices in this line.



New Galesburg Metal Skylight.—View in Parts and Erected.

Briscoe Mfg. Company.

Briscoe Mfg. Company, Detroit, Mich., successors to the Detroit Galvanizing & Sheet Metal Works and the Century Rural Mail Box Company, have recently reorganized with largely increased capital, the present capital being $250,000, paid in. The officers of the reorganized company are as follows: Benjamin Briscoe of Detroit, president; Richard Irvin of New York City, vice-president; Frank Briscoe of Detroit, secretary and treasurer, and Chas. Puddefoot of Detroit, superintendent. Mr. Irvin is the senior member of Richard Irvin & Co., exporters and importers, of New York. In connection with lines they have heretofore manufactured, such as oil cans, air tight stoves, rural mail boxes and specialties in sheet metal goods, they purpose adding a line of galvanized ware and a number of hardware specialties. They have lately installed a large number of presses and special machine tools, so that the equipment in their machine shop and pressroom is, they believe, one of the best in the country, the additions recently made giving them a very complete outfit for manufacturing any kind of sheet metal goods, either on contract for others or to market themselves.

New Tin Plate Company.

L. C. McFatridge of Atlanta, Ind., advises us that the organization of the Atlanta Rolling Mill & Tin Plate Company will be completed this week, and a charter will be applied for, with a capital stock of $250,000. Practically all of the stock has been provided for and the installation of the plant will be begun about June 1. As noted in these columns a few weeks ago, the company will re-establish the tin plate industry in the Atlanta Steel & Tin Plate plant recently dismantled by the American Tin Plate Company, installing a modern four-mill plant at first, which will later be increased to six mills. The product will be black and tin plate. The company will be ready to purchase entire equipment after June 1, including engine and boilers of from 1000 to 1200 horse-power, electric traveling crane, shears, &c.

The Budke Iron & Steel Company.

The Budke Iron & Steel Company have been organized at Pittsburgh with a capital of $850,000 and will apply for a Pennsylvania charter. The company will build a plant at Shannopin, Pa., on the Pittsburgh & Lake Erie Railroad, 19 miles from Pittsburgh, for the manufacture of the finer grades of iron and steel sheets, such as are used for enameling and deep stamping. The plant will be a modern one and will consist of a main building 100 feet wide and 150 feet long, a puddle and knobbling mill 200 feet long and 60 feet wide, a sheet mill building 325 feet long by 113 feet wide and a boiler house 100 x 80 feet. The equipment will consist of four stands of cold rolls, six stands of hot rolls, three stands of roughing rolls, one 25-ton electric crane, one 4-ton steam hammer, eight puddling furnaces, eight knobbling fires and three-high bar mill. It is possible the company may add an open hearth steel plant later on to make their own supply of steel. John F. Budke, who for many years was connected with the Canonsburg Iron & Steel Company, at Canonsburg, Pa., will be actively identified with the new concern, and B. C. Vaughn, formerly with the Pittsburgh & Lake Erie Railroad, will be treasurer.

A New Can Company.

The Columbia Can Company have been incorporated in St. Louis Mo. The papers were filed last Saturday, May 17, and the company will commence operations immediately at 501 North Main street. At a meeting of the stockholders, held last Saturday, the following officers were elected:

President, Herman F. Westerbeck.
Vice-President, Fred. L. Westerbeck.
Secretary and Treasurer, Emil J. Westerbeck.
Manager, Charles Doermann.

All the parties interested in this company have been in the business the greater part of their lives and are thoroughly experienced. Their plant will be equipped with the latest improved machinery, and when it is completed and in full working order will be one of the largest in the West. At present the factory will cover a floor space of 28,000 square feet.

THE AMERICAN CAN COMPANY have awarded the contract to C. R. Parlett of Norfolk, Va., for the erection of a new Tin Can factory in Baltimore, Md., to cost $68,000. The new plant will be located on land adjacent to the company's Norton factory.

The Fred. J. Swaine Company.

The Fred. J. Swaine Company, 930 and 932 North Main street, St. Louis, Mo., manufacturers of presses, dies and sheet metal machinery, are compelled, owing to their constantly increasing business, to find larger quarters and have purchased a site on the northeast corner of Seventh and O'Fallon streets, 111 x 125 feet, on which they will erect a modern factory with the latest facilities. The new shops, when completed, will be more than twice as large as the present quarters. The machine shops will be divided into two departments—namely, die and press work. The press department will be equipped throughout with traveling cranes, hoists, &c., and also with several new tools, such as planers, boring mills and a number of small tools. The die department will be augmented with several special tools to enable the handling of small special work. The pattern making department and the drafting rooms will be doubled in size. The blacksmith shop will be enlarged and equipped with all necessary tools. The company also propose adding about four ovens or furnaces for welding and hardening. The latter line has become quite an item in their business. Under the general offices will be located, in the basement, the boiler room, coal bin and also the washrooms for the men. The company say they have made every provision to have their lockers, wash stands, &c., equal to the finest in the country.

The Tin Plate Workers' Convention.

The fifth annual convention of the Tin Plate Workers' Protective Association, in session at New Castle, Pa., adjourned last week. A new tin house scale was adopted, but will not be made public until after a conference is had with the American Tin Plate Company and other concerns. The following officers were elected: George Powell, president, New Castle; Charles E. Lawyer, secretary and treasurer, Wheeling, W. Va.; Grant Jacobs, vice-president, first district; Bent L. Barrett, second district, New Castle; H. E. Barrett, third, or Pittsburgh district; James Smith, fourth district, Martin's Ferry; Board of Trustees: Benjamin Teagarden, Martin's Ferry; J. E. Elder, New Castle, and E. E. Catterhenry, Elwood, Ind. The next convention will be held at Anderson, Ind.

FLASHINGS.

CIRCULARS will soon be issued by the Amalgamated Association of Iron and Steel Workers, at Pittsburgh, calling attention to a resolution adopted at the Wheeling convention relating to union and nonunion mills. The resolution makes it obligatory upon all members of the association working in "open mills" to organize lodges, and if this is not done by July 1 they will be compelled to work in union mills or else be expelled from the organization.

TEN of the 30 mills of the Shenango plant of the American Tin Plate Company, at New Castle, Pa., resumed operations last week, after being shut down owing to the wreck of a large part of the plant by a cyclone. The other 20 mills will be placed in operation as soon as the necessary repairs can be carried out.

THE official figures of the British Board of Trade show that the shipments of Tin and Terne Plates to the United States during the month of April amounted to 5896 tons, as compared with 3676 tons in April, 1901. The total shipments of Tin Plates from the United Kingdom to this country in the four months ended April 30, 1902, amounted to 26,565 tons, as against 13,897 tons in the corresponding period of last year, making nearly double the amount of Tin Plates sent over so far this year as compared with last year. The total shipments of Tin Plates from Great Britain to all foreign countries shows a gain of 20,000 tons in the first four months of this year over those of last year. The countries which show the largest increase, apart from the United States, are Australia and Canada.

IT is reported that Thomas G. Brady has secured an option on 450 acres of land near Clarksburg, W. Va., for the erection of Steel and Sheet mills. Mr. Brady is said to be acting for a New York syndicate.

The Wheeling, Roofing & Cornice Company, Wheeling, W. Va., have begun work on the large plant that they will erect at New Martinsburg, W. Va. The company are erecting Sheet mills and a corrugating plant, and will put in a blast furnace later.

John D. Evans, superintendent of the Tin Bar mill of the Sharon Steel Company, died on May 8 of apoplexy, at his home in Sharon, Pa., at the age of 51 years.

The Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, have broken ground for the erection of their new Skelp mill. It is expected that this department will be in operation early in the fall.

The bi-monthly wage settlements of the Tin Plate, Sheet and Bar scales were made last week, with the representatives of the Amalgamated Association of Iron, Steel and Tin Workers, it being found that no changes in the present wage scale were due. The scale of wages paid during the past two months will continue until July 1.

Gummey, McFarland & Co., Philadelphia, Pa., report that they have booked some very large orders for Gummey's Anti Pinhole Genuine Charcoal Iron Tin Plates, particularly for delivery in the western part of Pennsylvania, Ohio and New York. One good sized lot has been shipped to Jamestown, N. Y., for use on the New York State Armory Building at that place; several orders of from 100 to 150 boxes have been shipped for Western delivery, and a large factory roof is being covered with these Plates in Philadelphia. Gummey's Anti Pinhole Plates, the makers advise us, are meeting with exceptional favor among architects and manufacturers of old time Tinware, and the demand for them has greatly increased.

W. H. Griffiths Company, Incorporated, of Washington, Pa., recently completed and put in operation their new Black Plate mills at Waynesburg, Pa. The company's plant has an annual capacity of about 12,000 tons. They are also operating a tinning department in connection with their works.

Lintz & Opel are a new firm in the roofing, guttering and architectural sheet metal working business, at Sherman, Texas. They also make a specialty of Tanks. They opened a shop at 215 South Travis street on May 1, and will be glad to receive catalogues and price-lists from manufacturers and dealers handling goods in their line.

The Allegheny Steel & Iron Company, manufacturers of Sheets, with offices in the Park Building, Pittsburgh, and works at Avenue, Pa., have started up a second 50-ton basic open hearth steel furnace. The greater part of the Steel made in this furnace will be sold in the open market.

The Jackson Tin Plate & Iron Company, Clarksburg, W. Va., put their plant in operation this week.

Patrick Henry, superintendent of the New Castle Works of the American Tin Plate Company, at New Castle, Pa., died suddenly in Pittsburgh last week of heart failure.

The Eastern Granite Roofing Company, 90-92 West Broadway, New York, issue a finely printed pamphlet devoted to "Roofs and how to cover them," with remarks on the merits of their Perfected Granite Roofing. This roofing, we are advised, has been in use 18 years throughout the country. Fourteen views are given of railroad shops, piers, freight houses, manufacturing establishments, &c., which are covered with this roofing.

Geo. L. Mesker & Co., Evansville, Ind., are sending out their 1902 catalogue showing many new designs of Store Fronts, a line of Steel Ceilings, and containing several pages of miscellaneous Iron Work for buildings. A page is devoted to illustrations of buildings in different parts of the country for which the firm have furnished complete fronts.

The subject of the wage scale for the coming year is being actively canvassed in the English Tin Plate trade. Several meetings of the Conciliation Board have been held, but notwithstanding the fact that the present agreement terminates at the end of June, no approach to a settlement of the matter appeared to be in sight by last advices. The workmen are firmly adhering to their demand for payment on the area basis, which demand is resisted with equal firmness by the employers. It is feared that unless the latter will concede the demands of the men a strike may ensue. Meanwhile, some classes of workmen, such as the doublers, are advancing claims for an increased rate of wages.

The advantages of metal over wood in the construction of Skylights is shown in those made by the G. Drouve Company, Bridgeport, Conn. The company claim that whereas wooden Skylights are apt to leak, their metal ones are tight as a drum, and that while stronger than wooden Skylights, they are less bulky, therefore admitting more light. A "sweat gutter" in the Drouve Skylight carries off the inside condensation.

The Bullock Home Sharpener.

The accompanying cuts illustrate the Bullock home sharpener, manufactured by the Bullock Mfg. Company, 183 South Clinton street, Chicago, Ill. The sharpener is made of cold rolled steel, nickeled and polished, and is designed to be readily attached to any sewing machine. The grinding surface, which is of emery, is ⅝ inch wide, and it is claimed to be as durable and practical as the wheels used in factory work. The simplicity, durability and practicability of the sharpener are referred to by the manufacturers.

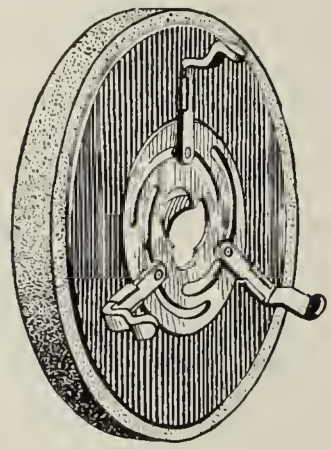


Fig. 1.—The Bullock Home Sharpener.

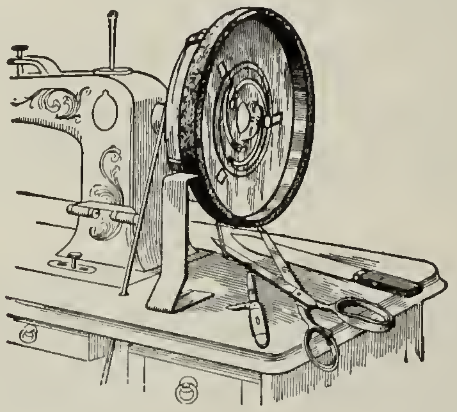

Fig. 2.—The Sharpener Attached to Sewing Machine.

A press report from Ogdensburg, N. Y., states that the Pittsburgh Reduction Company have secured 400 acres of land at Massena, N. Y., and will erect thereon five large buildings to cover about 15 acres. This plant will be devoted to the manufacture of Aluminum, and will cost, it is said, over $1,000,000. Electrical power from the St. Lawrence River will be used.

The Franklin Rolling Mill & Foundry Company, Franklin, Pa., have been incorporated with a capital of $750,000.

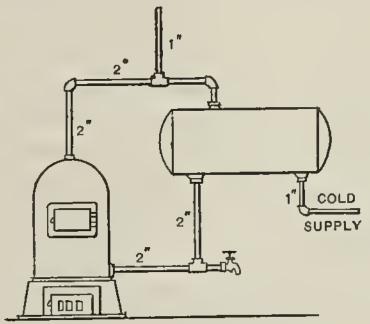
THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

IS TANK HEATER CORRECTLY CONNECTED?

From R. M. D., Connecticut.—Please examine the tank heater connection shown in the sketch herewith, which has been submitted to us for a hot water heating apparatus for supplying hot water for domestic use in a flat house. Will you kindly give us your criticism as to the connection?



THE METAL WORKER

Is Tank Heater Connected Correctly?

Note.—We shall be glad to present the views of our readers on this subject.

HOW DO YOU CONNECT EXPANSION TANKS?

From J. M., Detroit, Mich.—In reply to "J. T. W.," in *The Metal Worker* of May 17, would say that it depends upon where the expansion tank is located as to what is the best method to follow in connecting it with a system. If the expansion tank is placed in a bathroom or other room that has a radiator in it, so that there is never any danger of its freezing, a single pipe running from the return pipe at a point near the hot water heater and connecting at the bottom of the tank is all that is required. If the expansion tank is placed in an attic where there is no other warmth it should have a two-pipe connection, one pipe being connected exactly the same as previously described; but this pipe should have a tee in it just below the expansion tank. From the side of this tee a pipe should be carried to the flow pipe on the nearest radiator. This will keep the circulation and make the water in the tank warm enough to prevent freezing.

From W. H. O., Brooklyn, N. Y.—For the benefit of "J. T. W.," whose inquiry appears in *The Metal Worker* of May 17, I would state that in my experience the best method of connecting expansion tanks depends on the conditions. A job that I recently completed at Kensington, Brooklyn, has the bathroom on the first floor, consequently I had to place the expansion tank in the garret. To overcome any possibility of freezing I put in a double connection, which is certainly the best, although it entails more labor and expense in piping. The overflow pipe was run through the roof. An expansion tank is not a very desirable thing to place in a fine bathroom, but I have seen a great many of them placed in bathrooms with the overflow run to the closet cistern, having but a single connection with the return pipe. This connection makes the job cheaper when the figuring must be close.

GRADE FOR SEWER PIPE.

From N. B., Farmville, Va.—We desire the following information in regard to sewer pipes: What size should the main be? Can a success be made with a 2000-foot sewer with a flat at the lower or discharge end, and with a fall of 10 feet in the 2000 feet? How many manholes should be placed along the line? Should the lower end become engorged by back water at the discharge, what will prevent the escape of sewer gas in the dwellings connected with the sewer?

Answer.—To answer the first question, covering the necessary size of main sewer for a small town, we should have the following information: The population of the town at present; its increase by decades for the last 40 years and a topographical map showing the veins and layers. It should also be stated whether the town has a water supply or not. There are two kinds of sewerage systems: one that carries storm water from the roofs, yards and streets, and the other that carries only house sewage. The latter is by far the least expensive, and it is presumed that it is the system about which the inquiry is made. However, in order to give some information, let it be assumed that the population is about 3000, with a consumption of water amounting to 100 gallons per capita per day, and that half of this water is consumed between the hours of 7.30 a.m. and 5 p.m. This would give a consumption of 150,000 gallons of water in nine and one-half hours, or 15,790 gallons per hour. It is probable that, in such a town, there is a valley line in which the main sewer could be run, and into it the lateral sewer branches would connect and discharge. Let it also be assumed that this main sewer can have a full grade of 1 foot to each 300 feet. Assuming the above and allowing for a reasonable increase in population, it would seem that a 10-inch main sewer running half full would be ample for some time to come. No sewer laid in a public street should be less than 8 inches in diameter. The sewer should discharge into moving tide water and not into a brook or stream, care being taken that the sewer be extended into deep water, and that there is no possibility of the sewage being washed up on shore.

The flat referred to by our correspondent, on which it is proposed to discharge the sewage, we understand to be land that is generally covered by water, but at times may be bare. Such a flat is to be avoided. It is far preferable to build a water tight retaining basin of such size as to hold half of the daily sewage discharge, and discharge this at the turn of the tide from flood to ebb.

Manholes should be placed in the sewer at street intersections and at all points wherever they may be put in the alignment of grade. These manholes should be ample in size, with heavy iron head, having a perforated cover. As a general rule, manholes should not be placed further apart than 300 feet. The stoppage of flow in a sewer is a serious thing and results in damage suits against the city, for flooded cellars, &c. Sewer air may escape, should a stoppage occur, from the perforated covers in the iron manhole heads. At the point where the house sewer leaves the building a running trap of extra heavy cast iron should be placed, and from the house side of the trap a 4-inch vent for the trap should be run to the external air. The house trap will effectually prevent any sewer air entering the house.

SHRINKAGE OF COMPOSITION CASTINGS.

From H. B. F. C., Buffalo, N. Y.—We write to inquire whether you could inform us through your valuable columns what the average shrinkage should be in making castings, which weigh from ½ pound to 3 pounds each, the composition of which is copper, zinc and tin? Of course, the percentages of these materials vary according to the class of work, but we should like to know about what the average shrinkage is? We mean by shrinkage the loss in evaporation. We should also like to know what the average shrinkage would be when new metal is used, and also if scrap is used?

Answer.—Very little is known outside of the large melters of copper and its alloys as to the loss of metal by evaporation. The experience of brass founders is that the loss from copper and tin alloy, such as the bronzes, is very small and much less than through the skimmings; possibly one-tenth of 1 per cent. With copper and zinc alloys in the various grades of brass the loss increased with the percentage of zinc, and is almost wholly in zinc. It may be estimated at from 1 to 3 per cent., depending upon the care with which the mixture is made. Adding the zinc in small quantities through a covering of powdered charcoal modifies the loss to a considerable extent. In melting scrap brass, in addition to the loss by evaporation of the zinc, there is much loss by oxidation; varying with the high or low quality of the scrap. Two to 3 per cent. with good brass in large pieces and as much as 10 per cent. in fine stuff may be lost in the hands of experienced melters.

WILL A HOT WATER PLANT OPERATE?

From F. G. E., Delmar, Del.—I am about to add heating as a branch of my business and propose to install the first system in a house that I am building for my own use, and I would like to heat it with hot water if I can do it successfully and economically. As it is impossible to provide a cellar, I would be compelled to set the boiler on the same floor on which I would want to place some of the radiators. I will want to heat the sitting room and dining room on the first floor (these rooms are about 16 feet square), and also three rooms on the second floor. Can this be done successfully, and will it cost any more to operate it after it is put in than it would to heat the same amount of space with stoves?

Answer.—Buildings in which similar conditions exist are successfully heated with hot water systems, and the economy of their use is said to compare favorably with heating by stoves. The system of piping best adapted to such conditions is what is known as the overhead system. In the overhead system the heating main is carried up from the boiler to the highest radiator and run horizontally with the branches to the different radiators, drop mains being taken from this top horizontal main to the radiators placed on the lower floors. The returns from these radiators may be carried below the floor joists and rise to connect with the boiler, if that is of any advantage. Care should be taken to secure a proper pitch to the pipes and to cover those which are exposed, so as to prevent undue loss of heat or freezing. Arrangements should be made at the lowest point of the system to draw off all the water in case repairs are needed or the building is to remain unoccupied. A small pipe can be carried from the highest point in the horizontal heating main on the upper floor to an expansion tank, in order to allow the air in the system to escape as it is filled with water. In any system of heating it is well to secure a boiler and radiators of ample capacity for the work, using piping of generous size.

ROOFING OVER OLD ROOFS.

From G. A. H., Cincinnatus, N. Y.—Will the brothers of our craft please give their views and experience in laying galvanized iron roofing on old roofs? Is it better to tear off the old shingles and lay the iron on the roof boards, or let the shingles remain and lay the iron directly on the old shingles? The question is, which will make the best roof? There is a difference of opinion in our shop, and we wish to settle it by reading the experience of others.

WANTS A BACK NUMBER.

From Ernest Kolmer, 119 Lodi street, Akron, Ohio.—I should like to get a copy of *The Metal Worker* of June 2, 1900, and will be glad to hear from anybody who has a copy that he is willing to sell.

AUSTRALIAN ALUMINUM.

BY JOHN PLUMMER, SYDNEY, AUSTRALIA.

Although the discovery of aluminum dates only from 1828, it has long been recognized as one of the most useful and important of the minor metals, chiefly by reason of its extreme lightness, its weight, bulk for bulk, being only one-fourth that of silver, which it resembles in appearance. This lightness has determined its use in the construction of very delicate balances designed to register fractional weights. It also resists the action of sulphur and sulphuric compounds, which have the effect of blackening silver. It is obtained principally from bauxite, a mineral consisting chiefly of alumina, or oxide of aluminum and oxide of iron, which, until recently, was obtained principally from France.

The existence of bauxite in New South Wales, Australia, was not known until 1899, when it was recognized by Mr. Jaquet, State Geological Surveyor, at Wingello, about a hundred miles south of Sydney, where he found it occupying considerable areas. Almost simultaneously it was detected in extensive deposits in the Inverell and Emmaville districts, in the northern part of the State. At Emmaville, in 1886, Professor David, when making a geological survey of the tin mining field, found that 12 square miles of country were covered by deposits of laterite or volcanic ash, from a few feet up to 40 feet in thickness, and this material now proves to be bauxite and wocheinite, for it occurs both in the pisolitic and massive forms. In the Inverell district, also, it is now known to occupy very considerable areas. Its mode of occurrence is similar in both districts; it is frequently roughly stratified, and is generally found capping small hills, in many cases surrounding points of eruption. It is clearly of volcanic origin, and while in some cases it appears to consist of volcanic ash, in others it may have been derived from the decomposition of basalt in situ. In color the New South Wales bauxite varies from pale yellow to deep red. Near Inverell it has been extensively used for making roads, with very satisfactory results, its value in the production of aluminum being unknown at the time. Only the bauxite deposits near Emmaville have been officially mapped out as yet; nor has there been anything in the shape of a systematic examination of those whose existence in the State has so far been ascertained.

At the present time aluminum is largely used for many purposes, and others are continually being discovered. Its non-poisonous character causes it to be pre-eminently adapted for the manufacture of cooking utensils. Tinware, as every housewife knows, is not particularly cheap in the long run, for it is constantly wearing out; cast iron is heavy and brittle, and copper requires to be frequently retinned in order to avoid all danger to health. An aluminum saucepan costs no more in the first instance than does a copper one, weighs much less, is perfectly innocuous, and does not periodically need a fresh inside; consequently it is not surprising that the employment of aluminum in kitchens and canteens is spreading rapidly. Bcycles of all kinds, electric light fittings, chains, bridles, stirrups, surgical instruments, sextants and other scientific apparatus, keys, cigar cases, pen and pencil holders, toilet articles, plates and dishes, spoons, forks, frames, name plates, door furniture, hat and coat pegs, boot trees, fire engine fittings, business and visiting cards, photographic cameras, &c., are a few of the things that are being daily made in aluminum by various British and other firms; these articles being usually sold at the same price as if they were composed of brass. Again, frames for cabs and motor cars have been made in aluminum; and though in England experiments have not yet been tried in this direction, aluminum railway carriage frames are under review in France. Especially for motor cars should there be a large field for aluminum.

A further demand for the metal will be brought about by its introduction into the military services. All parts of the soldiers' equipment have practically been made already in aluminum; such as mess tins, water bottles, buttons, helmets, parts of rifles, cartridge cases, fittings for guns, tents, horseshoes, portable bridges, &c. True, nothing much has yet been done in England in this direction; but it is well known that Continental armies, notably that of Germany, are employing aluminum on a large scale. In metallurgy, shipbuilding and other directions also the use of aluminum is steadily increasing, and should its manufacture be started in New South Wales, where bauxite is apparently more abundant than generally supposed, a new and profitable industry would become established. The ore could be conveyed by rail to places where coal is cheap and plentiful; also the materials for constructing smelters. Or the coal could be taken to the neighborhood of the bauxite deposits. Either way there appears to be a good opening for those possessed of the necessary capital, experience and energy.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is strong and quiet.

Copper shows more firmness, with a better demand.

Pig Lead is dull and firm.

Spelter is more active and rather scarce; prices are ⅛c. to ¼c. higher.

Antimony is unchanged.

Nickel is in good demand, and without change in price.

Aluminum is firm and in good demand.

Tin Plates are quiet, with prices unchanged.

Black Sheets are firm; demand is rather lighter.

Galvanized Sheets are not in such heavy demand, but are still active and firm.

Old Metals are firmer, with Scrap Brass and Copper higher.

Foundry Iron is very scarce, with prices high and little doing, by reason of scarcity.

Sheet Copper is in good demand, with prices firm.

Sheet Zinc is without change.

Hardware is moving in good volume and prices remain strong.

Plumbers' Supplies are in good demand, with prices in general strong.

Steel Clad Bathtubs are likely to be reduced in price.

Stoves and Furnaces are being advanced in price, the average being about 5 per cent.

Freezers are scarce and stiff in price.

Wire Nails are in better supply and the market firm.

Cut Nails are still rather in scarce supply and prices are well maintained.

Window Glass is likely to undergo another advance.

White Lead is active and steady.

Linseed Oil is firm and unchanged.

Spirits Turpentine is more active, with prices unchanged.

METAL MARKET.

New York, May 23, 1902.

Pig Tin.—Practically no change has taken place in the market. Prices here are held at about the same point as last week. Throughout the entire week the market has been very quiet, but firm. Jobbers quote Straits Pig in small lots at 31c. to 32c. per lb., according to quantity. Arrivals thus far this month amount to about 2100 tons and may reach 2900 tons by the end of May.

Copper.—An advance in the market for Copper, which began at the end of last week, has continued, and it is said that some heavy purchasing has been done on the strength of the rise. The advance is attributed to the operations of certain producers and others interested in floating a new Copper company. Some large consumers, appearing apprehensive that the metal may take a sharp upward turn, have consequently come into the market, thus lending strength to the renewed firmness. It is not generally expected, however, that prices in the Copper market will advance to any material extent, as it is known that stocks of the metal are ample if the holders will only put them on the market. Jobbers' prices are unchanged and firm at 13c. to 13½c. per lb. for Lake Ingot in small lots, and 12¾c. to 13c. for Casting Copper. Exports continue to show a falling off, amounting this month to only about 8000 tons.

Sheet Copper.—The consumptive demand for Sheet Copper is reported as active and the mills are full of orders, but makers do not seem to be inclined to take contracts very far ahead at present prices. Practically all the material now being turned out goes directly into consumption, which is quite heavy at the present time and promises to continue so. Prices are firm on the basis of 18c. per lb. for Sheet Copper from store.

Pig Lead.—No change has developed in this market. Business continues on a moderate scale and prices remain steady. American Pig in small lots is quoted at 4.45c. to 4½c. per lb. It is reported that a movement is now under way looking toward the consolidation of the large Lead producers in the Southern Missouri district. It is also stated that renewed efforts are being put forth to effect a consolidation of manufacturers of Lead Pipe and other kindred products, but, although the project is thought to be a genuine one, nothing definite on this head has yet been announced. St. Louis advices report a lack of activity and snap in the Lead market at that point, with prices, however, holding steady at last week's figures.

Spelter.—This metal continues to grow firmer, and was especially strong this week as regards spot. The demand is keeping well up to the supply and producers find no difficulty in disposing of their metal promptly. It is reported that several middlemen are finding the shortage of supplies somewhat embarrassing at this time. The Ore situation continues to grow stronger. Jobbers' prices have been advanced from ⅛c. to ¼c. per lb. Good Western brands in small lots are now quoted at 4.85c. to 5c. per lb. St. Louis advices are to the effect that pending labor differences have induced an advance in the price of stocks of Spelter on hand, and the consumptive demand has been fair. Prices are very strong.

Sheet Zinc.—The demand for Sheet Zinc is of the usual proportions and prices are firmly maintained at 6¼c. per lb. for 600-lb. cask lots and 6¾c. to 7c. for smaller quantities.

Antimony—Is unchanged. Hallett's in small parcels is quoted at 8⅝ to 8¾c. per lb.; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—There is no change in the market for this metal. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues active, and prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates remains quiet and uninteresting. There is no report of new business of any importance, while the mills continue to make heavy deliveries on old contracts. The retail trade is of very fair proportions for the season, and the outlook in this branch is regarded as favorable. American Bessemer Coke Plates, IC, 14 x 20, in moderate sized lots, delivered at New York and corresponding points, are quoted at about $4.75 to $4.90 per box. Jobbers' prices on Bright Charcoal Plates have been reduced about 50c. per box, owing to more liberal deliveries and the elimination of the scarcity which prevailed some time back.

Sheets.—The demand for Sheets is scarcely as active as it has been for some time past, although it is still of large volume. At the close the market for both Black and Galvanized Sheets was decidedly firm, with no evidence of any weakening in the near future. Makers expect a rush of orders later on and are doing their best to get abreast of the business at present on their books, so as to be in shape to meet the future increase in the demand. Meanwhile consumers are able to get more prompt shipments than for a long time past. It is noted that the demand runs much heavier for Heavy Sheets than for the light varieties. Galvanized Sheets are not in such pressing demand. All the mills making this class of material are said to be filled up with orders for some time to come. Jobbers' prices are, if anything, a trifle lower, owing to the increase in stocks. No. 27 One Pass Cold Rolled Soft Steel Sheets are now selling at about 3.75c. to 3.80c., and No. 24 Galvanized at 4c. to 4.20c.

Chicago advices are as follows: A stronger tone has been developed, with an increased volume of business transacted and a scarcity especially in heavy Sheets. No. 27 Black Sheets in small lots from store are quoted at 3.45c. to 3.55c. Galvanized Sheets are quoted at net prices, small lots from store ruling at 4.70c. to 4.75c. for No. 27, Chicago.

Old Metals.—The market for Scrap Metals is firmer and prices are somewhat higher on Old Brass and Copper. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10¼c.
Light and Tinned Copper	per lb. 9¼c.
Heavy Brass	per lb. 8¼c.
Light Brass	per lb. 6½c.
Lead	per lb. 3⅝c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 2⅞c.
Pure Aluminum Sheet	per lb. 25 c.
Cast Aluminum	per lb. 20 c.
No. 1 Pewter	per lb. 18 c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$13.00 to 13.50
Heavy Cast Scrap, per gross ton	12.00 to 12.50
Stove Plate Scrap, per gross ton	8.50 to 9.00
Burnt Iron, per gross ton	7.00 to 7.25

THE PIG IRON MARKET.

New York.—The situation, so far as the local supply is concerned, has grown more serious, because of the Anthracite Coal strike. Melters of Iron are in increasing perplexity as to the immediate future, and some of the large foundries have even now been forced to curtail output. In the aggregate there are several thousand tons of Scotch Pig Iron coming in weekly. It is distributed in small lots in New England and along the coast. It is quoted $21.50 to $22 for one-third No. 1 and two-thirds No. 3. Southern Iron is being offered on the basis of $15.50 to $16 for No. 2, Birmingham, by interests formerly identified with the association. We quote, for summer delivery, Northern Iron, at tidewater, No. 1 X, nominal, $21.50 to $22; No. 2 X, $20 to $20.50; No. 2 Plain, $19.50 to $19.75. Tennessee and Alabama brands are as follows: No. 1 Foundry, $20.50 to $21; No. 2 Foundry, $19.25 to $19.75; No. 3 Foundry, $18.25 to $18.50.

Chicago.—While there has been an absence of large sales, the aggregate volume of business has been considerable, some dealers claiming a larger tonnage than during any other week since the heavy business of March. Quite a number of sales running from 100 to 500 tons have been placed for delivery during the last half of the year. The market could scarcely be any stronger. Iron for immediate shipment commands a premium of $1, or more, per ton over the prices current for late delivery, and 50c. per ton advance has been obtained on almost all grades of Southern Iron which have been sold. Notwithstanding the extremely high prices prevailing, the tendency seems to be still upward. There is no decrease in the melting of Iron in this section, but every day brings information of lighter stocks, many foundries working from hand to mouth, being obliged to enter the market to cover necessities, because of delayed shipments on contracts. We quote as follows:

Lake Superior Charcoal	$23.00 to $24.00
Local Coke Foundry, No. 1	22.00 to 22.50
Local Coke Foundry, No. 2	21.00 to 21.50
Local Coke Foundry, No. 3	20.50 to 21.00
Local Scotch, No. 1	22.00 to 23.00
Ohio Strong Softeners, No. 1	24.00 to 24.50
Southern Silvery, according to Silicon	20.40 to 20.90
Southern Coke, No. 1	20.15 to 21.15
Southern Coke, No. 2	19.65 to 20.65
Southern Coke, No. 3	19.15 to 19.65
Southern Coke, No. 1 Soft	20.40 to 21.15
Southern Coke, No. 2 Soft	19.65 to 20.40

Philadelphia.—Prices are too uncertain to be quoted with any closeness at the present time. We have heard of $20.50 for No. 2 Foundry Iron for June and July shipments, and also $21.50 and $22. Transactions are mostly for small lots, and it is difficult to place orders even for reduced quantities, as the furnaces are sold close up. For delivery during the last quarter of the year there is not much business to report. Makers of Pig Iron do not see much reason for discounting the future to any great extent, and as buyers are doubtful whether present prices can be maintained, they are not inclined to tie themselves to high priced Iron several months in advance of requirements. The natural result is an active demand for prompt shipment, on the best terms available, but with a mutual standoff for long deliveries. June and July shipments are anywhere from 50c. to $1 more than for the last half of the year, for which prices are usually quoted as follows for city and nearby deliveries:

No. 1 X Foundry	$20.50 to $21.50
No. 2 X Foundry	19.75 to 20.50
No. 2 Plain	19.50 to 20.00

Pittsburgh.—Sales of Pig Iron are confined to small lots, large consumers being covered and out of the market. No. 2 Foundry Iron is quoted at $21 to $21.50, Pittsburgh, but there have been recently some sales of round lots of Southern Foundry Iron for the Birmingham district at $20.15, delivered, Pittsburgh.

St. Louis.—The market at this point runs along in a quiet and even way, and the week under review is marked by some sales for delivery from July to December, aggregating some few thousand tons. All present offerings of No. 2 Foundry find a ready demand at $19 to $19.25, and other grades are held at prices to correspond. So far as we can ascertain these figures about mark the top price on recorded sales in this movement. The following is the range of prices current for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$19.75 to $20.00
Southern, No. 2 Foundry	19.00 to 19.25
Southern, No. 3 Foundry	18.50 to 18.75
Southern, No. 4 Foundry	18.00 to 18.25
No. 1 Soft	19.50 to 19.75
No. 2 Soft	19.00 to 19.25

CHICAGO REPORT.

Scrap Iron and Steel.—The demand for all kinds of Scrap has continued active and the market has ruled firm at full prices, with a scarcity of desirable grades. Old Rails are less freely offered and firmer in tone. We quote dealers' buying prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	.... to 13.00
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to 10.50
Burnt Iron and Grate Bars	8.00 to 9.00
Sheet Iron and Hoops	8.00 to 9.00
Plow Steel	12.00 to 13.00

Cast Borings	8.50 to 9.00
Turnings	12.00 to 12.50
Horseshoes	14.00 to 14.50

Old Metals.—In sympathy with the primary markets for new material, all kinds of Copper and Brass are stronger and higher, with a good demand and moderate offerings. Following are the prices paid by dealers in this market:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	10 c.
Copper Clips	11 c.
Red Brass	11¼c.
Yellow Brass	8½c.
Red Brass Borings	10 c.
Yellow Brass Borings	7½c.
Light Brass	7½c.
Pipe Lead	3.70c.
Tea Lead	3.35c.
Zinc	3 c.
Tin Foil	22 c.
Pewter, No. 1	19 c.
Pewter, No. 2	11 c.
Aluminum	20 c.

Old Rubber.—A further advance has been established on Rubber Shoes and a firm tone prevails for all kinds of Rubber, with an improved demand and only moderate offerings. The following prices are paid by dealers in this market:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7¼c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6 c.
Black Rubber	....	4 c.
White Rubber	....	8½c.

Rags.—Stocks are liberal and with freer offerings the market remains easy, there being but little outlet, but prices are unchanged. Dealers are buying at 70c. to 75c. per 100 lbs., Chicago delivery.

Anthracite Coal.—The market is unsettled, with few if any of the large companies accepting orders, and prices, while unchanged, are of a nominal character, subject to a discount of 40c. per ton for shipments in May; but should the strike continue higher prices may be expected at any time. The demand is very active and stocks on hand are not large.

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

THE HARDWARE TRADE.

The continued movement of goods, including the general line of hardware, keeps manufacturers and jobbers fully employed. This is especially true of season goods, the demand for which amounts almost to a clamor. Stocks of lawn mowers, freezers, and other goods which in the spring appeared ample for all requirements have dwindled in manufacturers' and jobbers' hands. The demand comes from the rank and file of the trade, and is devoid of speculative features. The protracted waiting of houses interested in the proposed jobbing consolidation has postponed the active purchase of goods. The uncertainty incident to this movement has had more or less influence on business, owing to doubt as to the outcome of the negotiations. Now that the matter has been, at least for the present, disposed of, the purchase of goods will doubtless be resumed in proportion to requirements, and buyers will plan for fall supplies. Manufacturers are not disposed to accept orders for fall shipment owing to the uncertainty of the future cost of raw material. Values of almost all lines of goods included in hardware stocks are firmer than in the spring owing to the gradual increase in cost of material and labor.

NOTES ON PRICES.

Steel Clad Bathtubs.—The manufacturers of Steel Clad Copper Lined Bathtubs, Steel Enameled (Painted) Bathtubs and Nickeloid and Rex Tubs are about to issue new list prices for this class of goods. The new list prices which the manufacturers of Enameled Cast Iron Tubs issued and put into effect on April 1, have put the lists for the Enameled Cast Iron Tubs below those of the Steel Clad Copper Lined and the Rex Tubs and the disparity in lists now existing is a series obstacle to the sale of Tubs of the Steel Clad variety. New list prices will be issued, showing a reduction, it is understood, of about 33 1-3 per cent. from the lists now prevailing. It is expected that the new lists will be in effect within the next week or ten days.

Plumbers' Sanitary Earthen Ware.—The members of the Sanitary Potters' Association have issued a circular letter to the trade in which they reiterate certain conditions of sale which have prevailed for some time past in the business, and they have also formulated some new rules by which their sales of Earthen Ware will, in the future, be governed. Under date of May 15. 1902, the following rules were put into effect:

> In order to remove any misunderstanding regarding trade terms and usages, we would call your attention to the following:
>
> 1. Terms of sale are net 30 days, or a discount of 2 per cent. will be allowed for cash received within ten days from date of invoice.
> 2. We do not allow for breakage in transit.
> 3. A charge of 5 per cent. will be added to the net invoice prices of ware for printing or stamping name on all staple closets, basins and urinals, short and tall hoppers and miscellaneous articles.
> 4. A charge of not less than $2 will be made for engraving the plumber's name on new name plate for use on ware, and an additional charge of 5 per cent. will be made, based on the net invoice price on such articles, for all goods stamped with the plumbers' name from said plate.
> 5. All goods shall be sold to the jobbing trade only.

The above is signed by the Trenton Potteries Company, Thos. Maddock's Sons Company, John Maddock & Sons, Keystone Pottery Company, Bellmark Pottery Company, Egyptian Pottery Company, Willets Mfg. Company, Sanitary Earthenware Specialty Company, Brian Pottery Company, Mercer Pottery Company, Acme Pottery Company, Ironsides Pottery Company, Standard Sanitary Pottery Company, Great Western Pottery Company and Riverside Pottery Company.

Walker & Pratt Mfg. Company, 31-35 Union street, Boston, Mass., announce, under date of May 20, that owing to the recent advances in prices of Iron and other materials and supplies entering into the construction of their goods, they have advanced the trade prices of their Stoves, Ranges and Furnaces 5 per cent., to take effect on the date named.

The Utica Heater Company, Utica, N. Y., issued, under date of May 15, a notice to the trade stating that on and after June 1, owing to the advance in Pig Iron and other materials, together with the recent advances in labor, they would withdraw all prices on their Furnaces. New prices will be furnished on application.

Follansbee Brothers Company, Pittsburgh, Pa., have sent out, under date of May 12, a new price-list of their high grade Roofing Plates, Bright Tin Plates, Solder, Sheet Zinc, Black, Galvanized, Polished and Planished Steel Sheets, Steel and Galvanized Roofing, Siding and Ceiling and Galvanized Ridge Roll.

Freezers.—The demand for Ice Cream Freezers is reported to be very heavy at the present time and manufacturers are from six weeks to two months behind in shipments. Jobbers complain that they cannot get enough of these goods to satisfy the demands of their customers. Prices on this line are very stiff.

Wire Nails.—The urgency for Wire Nails is not so acute as it was a month ago and manufacturers are catching up with orders. The New York market is in a very fair condition. The volume of business is satisfactory and stocks are well enough assorted to supply the demands of consumers. Prices are firm, small lots from store being quoted at $2.30 per keg.

Cut Nails.—The scarcity of Steel still causes delay in mills making prompt shipments of Cut Nails. The demand is about in the usual proportion to Wire Nails. The advances on the Cut Nail card are maintained in the New York market on small or mixed lots of Nails. Small lots of Cut Nails from store are quoted at $2.30 per keg.

Window Glass.—A meeting of the Window Glass Jobbers' Association will take place in Chicago within a few days and an advance in prices will be considered at this meeting. Some in the trade think that an advance will not be made at once, owing to the limited demand for Glass. The tendency, however, is undoubtedly toward higher prices, jobbers quoting Single and Double Strength Glass from store at 89 per cent. discount.

White Lead.—The demand for White Lead in Oil is reported as especially large from the South and West. An improvement is expected in the East during the summer months, at which time a larger amount of work is done. Prices are unchanged and steady. White Lead in Oil sells in retail quantities at 6½ to 6¾ cents per pound.

Linseed Oil.—The conditions in the Linseed Oil market are the same as for some time past. The current demand is restricted to small lots, while considerable Oil is being distributed on contracts. Mills are not seeking new business, and the market is firm. City Raw in small lots is quoted at 67 to 67½ cents per gallon.

Spirits Turpentine.—The strong tone of the Southern market resulted in quite an active local demand during the early part of the week, but the activity fell off somewhat in the last few days. The season's receipts of Turpentine at the South are reported as being about 6000 barrels behind last year. Jobbers' prices for Turpentine in retail quantities are 48 to 48½ cents per gallon.

JACOB MEURER of the firm of Meurer Brothers, Brooklyn, N. Y., dealers in Tin Plates, Metals, Roofing Supplies, &c., sails on Saturday, June 4, by the White Star Liner "Majestic" for a six weeks' trip to Europe for rest and pleasure. This is about the first prolonged holiday that Mr. Meurer has taken since he started in business, and his many friends in the trade unite in wishing him an exceedingly pleasant and satisfactory vacation, which he has well earned. Mr. Meurer, who is a persistent worker, finds that he needs this period of relaxation from the daily burden of business, which increases with him as the years go by.

Metal Polishes.

Some metallic articles have a brilliant luster, says the *Decorators' Gazette and Plumbers' Review* of London, and owe any beauty they may possess to this luster. In order to preserve it the articles are frequently lacquered; but by wear the lacquer comes off, and then exposure to air causes the metal to become tarnished, and to restore the luster the article is polished. The best luster is produced by friction, but this may be assisted by the use of polishing soaps, polishing pomades, polishing powders, polishing rags and such like, of which there are many makers; and for each of these polishing compounds various formulæ have been published. The active constituent of many of these is generally chalk, rouge, or tripoli, because these produce a polish on metallic surfaces, while some oil is frequently added as a medium for carrying them, and also some acid body to assist in cleaning the metal.

The following recipes give good polishing soaps:

1. 20 to 25 pounds liquid curd soap are intimately mixed with about 30 pounds of fine chalk and ½ pound Venetian red.

2. 26 pounds liquid cocoanut oil soap are mixed with 12 pounds tripoli and 1 pound each of alum, tartaric acid and white lead.

3. 25 pounds melted cocoanut oil are saponified with 12 pounds soda lye of 38 to 40 degrees B., after which 3 pounds rouge, 3 pounds water and 2 ounces ammonia are crutched in.

Polishing soaps are generally cut into cakes and stamped or pressed and brought into commerce with directions for use. The directions generally state that a small quantity of the soap is put on the metallic article to be polished with a damp flannel and rubbed until the desired polish is obtained.

Good recipes for polishing pastes are the following:

1. 5 pounds lard or yellow vaseline are melted and mixed with 1 pound fine rouge.

2. 2 pounds palm oil and 2 pounds vaseline are melted together, and then 1 pound rouge, ½ pound tripoli and 1 ounce oxalic acid are stirred in.

3. 4 pounds vaseline, 2 pounds oleic acid and 1 pound tripoli and sufficient kieselguhr are mixed together to form a paste of suitable consistence.

4. 4 pounds vaseline and 1 pound lard are melted and mixed with 1 pound rouge.

The polishing pomades are generally perfumed with essence of mirbane and filled into tin boxes.

Polishing powders are advantageously prepared according to the following recipes:

1. 4 pounds magnesium carbonate, 4 pounds chalk and 4 pounds rouge are intimately mixed.

2. 4 pounds magnesium carbonate are mixed with ¼ pound fine rouge.

3. 5 pounds fine levigated whiting and 2 pounds Venetian red are ground together.

◆

TRADE NOTES.

H. N. Shimer & Co., Philadelphia, smelters, refiners and dealers in Scrap Metals, have built a new refinery at Nineteenth street and Washington avenue, that city.

The Texas Fuel Oil Burner Company have been incorporated at Temple, Texas, with a capital stock of $50,000, by W. T. Bessonnette, C. R. Keesdike, N. A. Sayre and others.

The Greater New York Crude Oil Burner Company, New York City, have been incorporated with a capital of $600,000, to manufacture Oil Burners. The incorporators are Henry J. Kingsbury, Alfred George Brown and Frank R. Seiler of East Orange, N. J.

The Ohio Brass Company, with a capital of $1,000,000, have been incorporated under New Jersey laws to manufacture and deal in Brass Goods. The incorporators are Frank B. Black, Reid Carpenter, Charles N. King, Harry F. Black, George F. Lucas and E. T. Cook, all of Mansfield, Ohio.

Sidney Shepard & Co., Buffalo, N. Y., are making some important extensions to their plant. They have purchased three city blocks adjoining their present factory, and will erect upon this ground a number of new buildings adapted to the various lines of manufacture which they are carrying on. The buildings will be put up by degrees and occupied as soon as finished. The great increase in the company's business has rendered this extension imperative.

Cyrus Fowler has opened a store for the sale of Tinware and Enameled Ware, at Freedom, N. H.

◆

The works of the Welsbach Incandescent Company, at Westminster, England, were visited by a fire on May 20, and several floors of the building were cleaned out. The building adjoins the St. James' Park station of the underground road, and traffic was suspended temporarily. The damage to the Welsbach plant is estimated at $100,000.

Hand Elevators and Dumbwaiters

Made to be sold by the Hardware Trade. Can be placed in position by any carpenter. Catalogue free.

ENERGY ELEVATOR CO.,
408 Cherry St., Phila., Pa.

This One IS Running.

And has been continually, since 1891. We offer at a BARGAIN price our business—that of manufacturing warm air registers—including names of customers, brass patterns of excellent design, Japanning oven, upright drill, emery grinders and other tools and appliances, as well as the prestige of eleven years at the same location. The business may be continued (not resuscitated, as it is ALIVE) at the same place, or advantageously added to that of any foundry, furnace manufacturer or maker of hardware. The latter half of the year is the busy season, and the building boom guarantees an exceptional demand at present. Our goods rank high; we refer to all with whom we have had dealings, in respect to our reputation.

RIVES & CO., Rochester, N. Y.

Address P. O. BOX 131,
Millerton, N. Y.

FOR SALE.

A valuable manufacturing property, situated at 23d and Smallman Streets, Pittsburg, Pa. Remarkably well located as to shipping facilities, consisting of new steel constructed building 118 x 154 feet, thoroughly equipped with suitable machinery and tools for working in sheet metals. This establishment has a long ground lease, on very favorable terms and a large trade that will naturally follow it. It is the only concern in the Pittsburg district, with all machinery, for making corrugated conductor pipe, eaves trough, ridge roll, etc. This is an opportunity to secure a bargain for one desiring a business, that can be operated at once. Any one caring to investigate, with object of buying the building, machinery, etc., or any practical party, with capital caring to take an interest in the business, please address

H. L. IRWIN, Receiver for
Marlin & Co., Inc.,
Pittsburg, Pa.

For Sale.

Owing to having other interests in the manufacturing line, will sell Hardware, Stove Furnace, Mantle and Jobbing business, at a very reasonable price and on very reasonable terms. Installed 83 furnaces last season and 55 Mantles.

Battle Creek is a city of 25,000 inhabitants, and there is at present 63 new houses in course of construction here, and prospects of over 300 being built this year.

For further particulars address

THE UNITED STATES REGISTER CO.,
61-63 State St., E. Battle Creek, Mich.

FOR SALE.

Patent Self Adjustable Stove Pipe Thimble.

Will adjust itself to all sizes of Stove Pipe and hold it secure. NO NAILING or FASTENING necessary. I have all the machinery and everything necessary to manufacture the Patent. Will sell cheap for cash.

Address "MRS. B.,"
Care *The Metal Worker*, Cincinnati. O.

FOR SALE.

A clean stock of Hardware, Stoves and Queensware. All kinds of wire fencing. Located in central part of Southwest Missouri. County seat. Between 6,000 and 7,000 inhabitants. Three railroads. Good schools and churches. Stock between $8,000 and $10,000. Sales from $22,000 to $25,000. Rare chance. Reason, advanced age. Business over 30 years's standing. Can look up our standing in commercial agency. Will sell for cash only. Have tin shop and plumbing department. Address BOX 41, care *The Metal Worker*, Chicago.

The W. E. Spangler Double Lock Folder or Edger and Repairs

can be had from the W. S. Tool and Machine Works, York, Pa., or No. 3243 M. St., Washington, D. C.

BLACK ASPHALT ROOF PAINT

It is used extensively in every State in the Union. It withstands extreme heat or severe cold, and has a tenacity and elasticity peculiarly its own. It is ready for use, easily applied, protects and preserves any exposed surface.

For Tin and Iron Roofs, also Bridges, Gas Tanks and Underground Pipes

This Paint has never been equaled. **TIN ROOFS,** even when rusted, broken and leaking, can be rendered water-tight and serviceable; our Asphalt Roof Paint and Cement fills up holes, breaks, joints, and by its elastic and tenacious qualities keeps the roof tight.

How to Make the Best Roof

M F Roofing Tin is the first requisite; capable work the second—that is all—except, the roof will last 50 years. The manufacturers of M F Roofing Tin have lately published a complete manual of roofing and roofing material which will be sent free to anyone interested in roofs.

MF Roofing Tin

is made entirely by hand labor—the "old-style" process. It has the heaviest coating of pure tin and new lead—impervious to rust or atmospheric gases. Ask your roofer—or for a copy of the book,

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

Team Work.

Of many a metal ceiling it may be truthfully said that it shows a shocking disregard of even the first principles " of team work." In other words, the different parts of the ceiling do not harmonize with each other, hence the result is plainly a conglomeration. Berger's Classik Metal Ceilings avoid conglomerations. Berger's Classik Metal Ceilings are made in a series of complete and artistic classified designs. Each classified design embodies all the pieces necessary for a variety of complete and artistic ceiling combinations in that style. Berger's Classik Metal Ceilings leave no excuse for unartistic combinations or mixture of styles. Get our catalogue and see for yourself. We mail it free upon application.

Ceilings.

An Argument.

When accepting the agency for a line of ceilings, remember that time means money to you, and if it takes twice as long as necessary to erect a cheap metal ceiling because of faulty construction, what matters a few cents difference in the original price? You depend on making your profits hy the time it takes to put the ceiling in place. Get

"CANTON" CEILINGS

and you have a winner. They are artistic in design and are easy to apply because all parts match perfectly, alignment is straight and regular and joints are tight fitting, requiring no putty to close cracks, which will mean a saving to you of 50 per cent. in labor.

Let us demonstrate what we say. Give us a trial order and others will follow.

Complete assortment of classified designs.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
  1. MITER CUTTING.
  2. FLARING WORK.
  3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical, Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc, Automatic Gauge. Will cut No. 2 iron.
97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

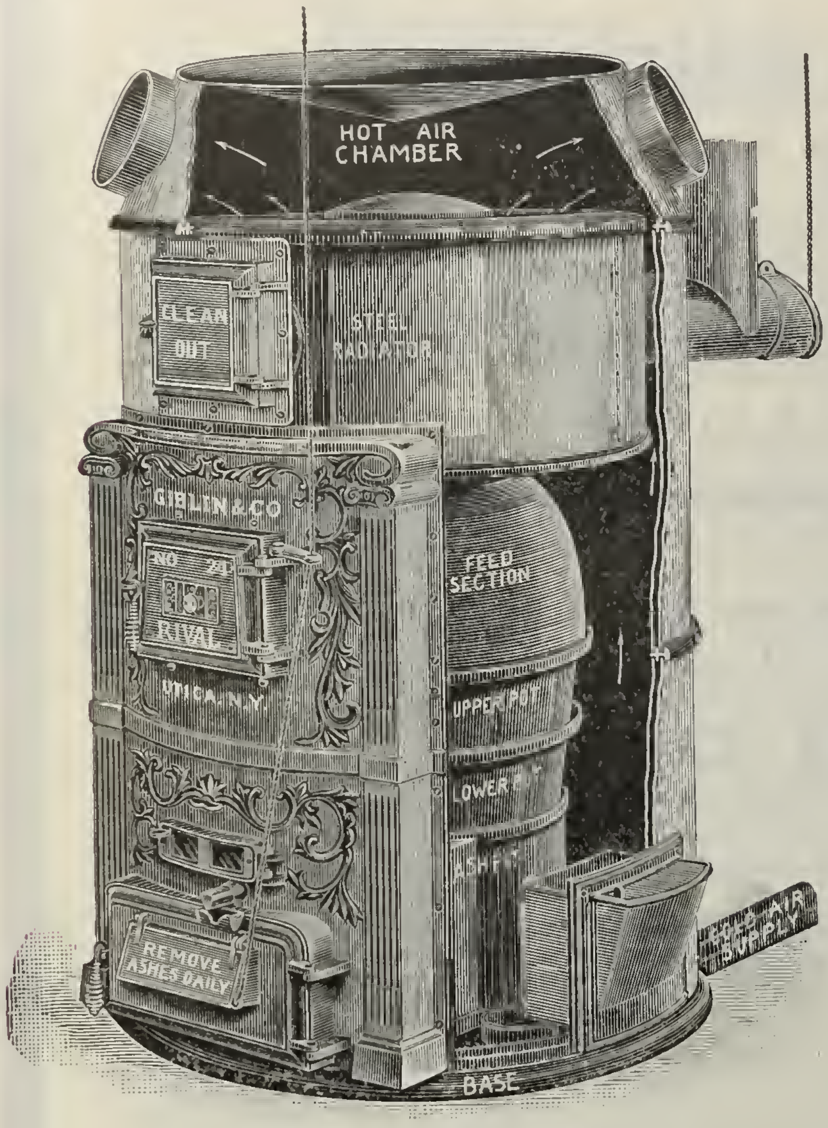
FIVE HUNDRED DEALERS



in the United States have sold **RIVAL** furnaces for the past fifteen years and are selling them now. They have allowed other dealers to put in the **CHEAP WORK** and have given their customers

RELIABLE FURNACES

wisely installed and thoroughly efficient in operation. Where **RIVAL** furnaces have been sold the general tone of a furnace business has been advanced to a higher level. Where they have not been sold the furnace business has been in disrepute. Dealers that have had an unsatisfactory business during the past year, have had

MUCH TROUBLE and LITTLE PROFIT

should consider that possibly it is owing to the character of the heaters they sell. We want good dealers to sell our furnaces, install them in a good manner, and good satisfaction will result with increased business at good profit. Our catalog illustrates and describes the line of heaters we make and on application we will quote right prices.

GIBLIN & CO.,

THE PATRIC FURNACE

IS A COMBINATION OF

GOOD THINGS

For the Dealer and User.

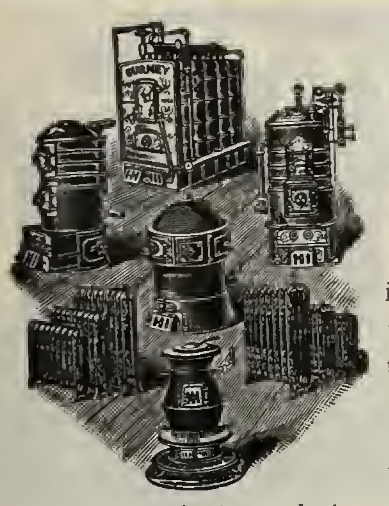
Scientific and Simple in construction. The Coking and Smoke-Burning is a trade-winner. Very economical. Has an efficient Hot-Blast. Exceedingly durable. A success for 29 years. Easy to sell. Easy to operate. Easy to install.

Let us send you a catalogue that tells you all about it.

The Patric Furnace Company,

SPRINGFIELD, OHIO.

YOU NEED THEM.



Some one has said "We need all and all need us." We're sure you need

"GURNEY" HEATERS,

Bright Idea, Doric and 400 Series,

if you would make the most of your business, because the "Gurney" possesses those attributes which appeal strongest to heater buyers; the ability to cut down the coal bill, to furnish the largest amount of heat possible from the fuel consumed as well as the ability to wear several years longer than other heaters.

You may not be able to get business with some heaters, but the dealers who handle the "Gurney" never have any trouble. Weigh this fact carefully, then write for particulars relative to an agency.

HEADQUARTERS FOR

WICK **RINGS**

For all Blue Flame Oil Stoves made—at startling low prices.

ELECTRIC BLUE FLAME COOKS

Are what you want for Summer trade.

Philadelphia and Baltimore.

IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

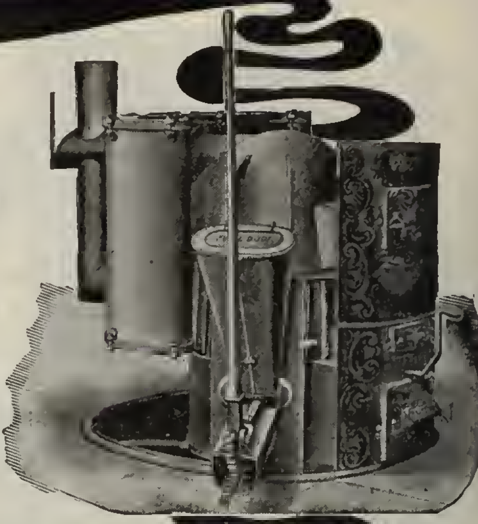
you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

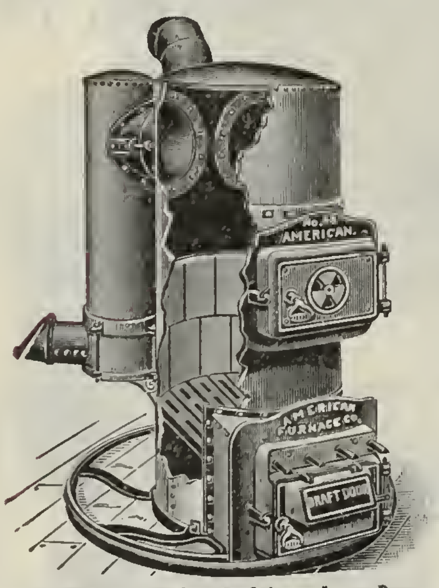
THE PECK-WILLIAMSON COMPANY,
CINCINNATI, OHIO.



Your Guarantee is Good,

If backed up by our line. We make many kinds and sizes of steam and hot water boilers, and you as a dealer ought to know all about this line. Let us send you our printed matter and post you on the standard line. Write to-day.

KEWANEE BOILER COMPANY
KEWANEE, ILLS.



Burn Hard or Soft Coal, or Coke. Large Doors.

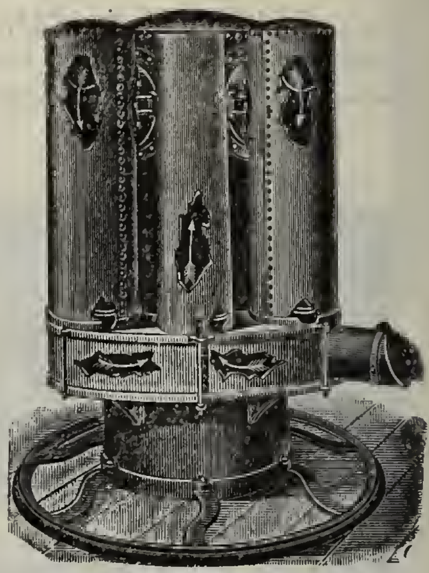
About Fire Pots.

We formerly lined our fire pots with cast iron—then they cracked and warped. Now we use fire brick for lining and will guarantee it for five years. The lining is replaced through the fire door.

The **AMERICAN FURNACE** is made strong in places where other furnaces have proven weak; it is made of heavy steel and riveted tight like a boiler. Will burn any kind of fuel.

You can only build up a permanent furnace business by handling a first-class furnace. We manufacture for the better class of trade.

The American Furnace Co.,
1911-13 PINE STREET, · ST. LOUIS, MO.



Large Radiators, easy to clean out.

Write for prices and secure the agency before the other fellow gets it.

The "HOME WINTHROP" range has a **dust flue** which takes **all** the dust up chimney even if the draft slide is open when you shake the grate.

The "HOME WINTHROP" heats **ALL of FIVE SIDES OF THE OVEN.**

Do you sell a range that is better than others, and if so, how does it differ from them except in ornamentation and name on Oven Door?

DIGHTON FURNACE CO., Taunton, Mass.

The New WALKER BOILER for Steam: for Water

This shows sectional view of our **15 Series Walker Boiler.** It is made for both Steam and Water Heating, and we have it in five sizes, with capacities from 400 square feet to 900 square feet for Water and from 240 square feet to 540 square feet for Steam.

This Boiler is simple, strong and serviceable; has a deep fire box; carries fire 12 hours without attention. Just the Boiler for the "Homes of the People."

"Honest Ratings." **WRITE FOR CATALOGUE No. 31.—Just Out.**

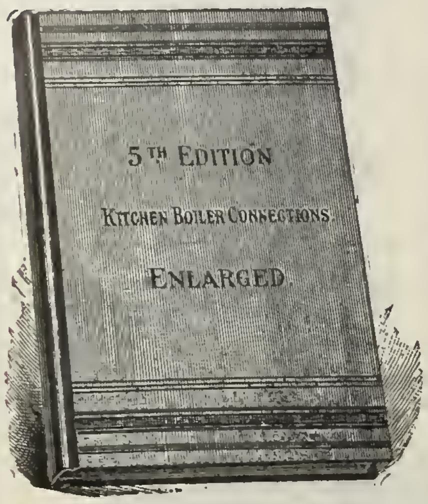
KITCHEN BOILER CONNECTIONS.



A SELECTION OF

Practical Letters and Articles Relating to Water Backs and Range Boilers.

FIFTH ENLARGED EDITION.

194 Pages, 113 Illustrations, 6 x 9 in
Cloth Bound.

Price, $1.00, Postpaid.

Press Notices of First Edition:

Can be considered an authority on the subject to which it relates.—*American Engineering.*

The Metal Worker produces in this volume a number of queries, with answers thereto, which have appeared in that paper. It will be seen that *any plumber who is troubled to make boilers work satisfactorily will here find his troubles alleviated. It contains numerous illustrations and throughout is highly practical from the standpoint of the plumber.* It contains a table of contents and an index.—*Scientific American.*

The publisher of this work is well known for his former successful efforts in the publication of useful and thoroughly practical books for metal workers and steam fitters. The book before us is a model of its kind in judicious compilation, practical instruction, neat illustrations and general typographical appearance.—*The Master Steam Fitter.*

The book is well got up and the information well given. Those interested in works of this character will do well in buying it.—*The Plumber and Decorator.*

Can be considered an authority on the subject to which it relates.—*American Engineering.*

Nearly every problem is illustrated fully and this interesting question of water back connections will be found to be quite fully treated in the volume.—*Domestic Engineering.*

ABOUT ESTIMATE BOOKS

For Plumbers and Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.
W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.
W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.
CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.
THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the "*CONTRACT AND ESTIMATE RECORD BOOKS*" come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

200 Pages. Arranged for 100 Estimates. Size 8 x 11 inches. Cloth bound, $1.50

500 Pages. Arranged for 250 Estimates. Size 8 x 11 inches. Cloth bound, $2.50

POCKET EDITION.

200 Pages. Arranged for 50 Estimates. Size 3½ x 8 in. (oblong). Flexible cloth binding, $0.50

CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates. 7 x 12 inches. Cloth bound, $1.50

NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, businesslike record, and a sure means of avoiding loss due to mistakes and omissions.

Sent prepaid on receipt of price.

The Anthracite Coal Strike.

While the strike of the anthracite coal miners is operating to the advantage of the producers of coke and bituminous coal in stimulating the demand for those fuels among consumers who have depended hitherto upon anthracite coal, the benefit derived by the soft coal and coke interests is more than balanced by the unfavorable effects of the strike, which embrace the idleness in the first place of over 140,000 men directly engaged in mining anthracite coal, to whom in ordinary course over $1,000,000 in wages would be paid every week. The loss of this purchasing capacity is no small matter to the country, even though it be confined to a single State. But the strike is not restricted in its wage reducing effects to those directly employed in mining. Thousands of men depend for their employment on the steadiness with which the anthracite mines turn out their product. They cover those who furnish supplies of all kinds to the anthracite mining sections, but more especially those connected with transportation interests. Other thousands have been thrown idle by the cessation of general business in mining towns. The number of unemployed will probably be increased very considerably as Eastern manufacturing establishments are thrown into idleness because of the lack of the necessary fuel.

The disadvantages and losses to general business are so great that it will be to the interest of the country if the strike should be settled as speedily as possible. Notwithstanding the optimism of those who prophesied an early termination, it appears to be running along with no indication of collapse. The miners are apparently determined to make a test of endurance, and the managers of the mining companies are equally resolute. It is fortunate that sympathetic strikes are not easily inaugurated, for if they were, the miners in the soft coal districts would be expected to assist their colleagues in the anthracite region and by the declaration of a general coal strike cause serious distress throughout the country. Labor leaders have shown a disposition in late years to widen the area of strikes, but thus far they have not succeeded in carrying through a movement of this character of any great magnitude. While the anthracite mining companies absolutely refuse to permit outside interests to exert any influence in settling this strike, it is earnestly to be hoped that some way may be speedily found for bringing the struggle to a termination. All business men will certainly breathe much more freely when this menace to prosperity has been removed.

Scarcity of Skilled Labor in Tin Plate and Sheet Mills.

From several quarters come reports of a growing scarcity of skilled labor among the sheet and tin plate plants of the country. With the starting up of so many new independent enterprises in this field, it seems that the available supply of men who are qualified to assume the more responsible positions in the mills is becoming exhausted. It is understood that some of the new plants have been seriously crippled through inability to obtain a sufficient supply of this class of labor. No doubt there are a large number of young men growing up in the mills who are learning the business and who eventually will become skilled sheet and tin plate mill men. But it takes a man, as a rule, several years to acquire the necessary skill and judgment to enable him to fill the more responsible positions in the mills where experience and delicate work are required. The present position of the American tin plate and sheet manufacturing industries in respect of skilled labor is an illuminating illustration of the benefits accruing to this country by the establishment of these industries. They are providing work for many thousands of young Americans and paying out millions of dollars a year in wages, which would not have been the case, at least in regard to the tin plate industry, if it had not been established through the enactment of the McKinley tariff law. This law met with great opposition on the part of many well meaning but ill-judging people, who feared that the establishment of a protected domestic industry would mean an enormous increase in the price of tin plates to the general public. As is well known, this fear has been proved groundless, while the industry in question, as before stated, has been the means of introducing a lucrative branch of work into the United States, whereby thousands of men with their families are enabled to earn a comfortable living.

Building Activity in the South.

Probably no part of this country has shared to a larger degree in the prevailing prosperity of the past two years than the South. Strong evidence of the general business activity in that section of the country is presented in the reports of building operations that come from that part of the country. Building is said to be going on on a more liberal scale than ever before in most of the Southern cities. The citizens of Jacksonville, Fla., are spending millions of dollars in buildings to replace those destroyed by the great fire which visited that thriving city a year ago. In Atlanta, Ga., and Birmingham, Ala., the building business is described as particularly brisk. A noticeable feature of the new construction in those cities is the number of large structures for business and public purposes, as well as handsome residences, that are being erected, many of which are of modern fire proof construction type. In several of the prominent Southern business centers the demand for houses exceeds the supply. This is said to be particularly the case in the two cities last named, as well as in Knoxville, Tenn., and in Richmond and Norfolk, Va. Roanoke, Danville and several other cities in the Old Dominion State are also sharing in the prevailing building activity. In connection with the present prosperous condition at the South, it is not strange to learn that there is an urgent and growing demand in that section for property qualified young mechanics, as well as for professional and business men of all kinds. The supply of adequate skilled labor is one of the great problems of the South to-day, and a strong movement is on foot to meet the growing requirements in this direction, by the establishment of technical and trade schools throughout the Southern States. This subject is now occupying the attention of business men and others in the South to a greater degree than in any other part of the country.

Is a Man of Forty-five a "Back Number"?

In a report to his Government on the subject of American business methods, the British Consul at Chicago dwells upon the difficulty of a man over forty-five years of age in finding work in that city. This, he considers a great fault, and it is the only blemish he seems to have discovered in what he evidently considers an otherwise admirable business system. "There are many men in good positions over that age," he says, "who will, in all probability, retain them for some years and then retire; but a newcomer of that age has little chance of employment, as he cannot expect to learn new ways. A man who is out of work at the age mentioned is regarded with suspicion, especially when trade is good, because, if he proved that he was worthy of his position—which should be a good one after many years of service—he would not have been forced out; or, if he had, some other firm who had come into contact with him in business would try to secure his services." This will be taken as a fairly correct statement of facts. Nowadays a man of middle age who has no marked specialty of knowledge or skill in some department, and who, from whatever cause, finds himself out of employment, usually has a hard time to secure work that will yield him anything like a comfortable living. This is essentially an age of young men, and it is becoming increasingly difficult for the older men to secure positions in any profession, trade or business. Complaints of an arbitrary "dead line" are heard in many fields of work in this country. The man who has passed forty-five or fifty mile stones on the road of life, and who should be in the plenitude of his mental and physical powers with a fund of valuable experience at his back, not seldom finds himself shouldered aside by younger men. Whether this is simply a passing phase, or a policy that is destined to endure, is hard to say; but the fact remains that to-day age and ripe experience are often put aside in favor of youth and inexperience. This tendency is one of the features of modern business life in America, and it is a fact that must be taken into consideration as bearing upon the commercial and industrial future of the country.

Active Demand for Sheet Metal Workers.

A good idea of the activity, or otherwise, of the various trades in which our readers are interested can usually be gained from a scrutiny of the Labor Exchange department of this paper. The applications for help and for employment contained therein form a pretty correct barometer of the condition of these trades. For some weeks past it will have been noticed that the "Help Wanted" advertisements have materially exceeded those under the heading of "Situations Wanted," suggesting that the demand for skilled workmen is greater than the supply. It is interesting, in this connection, to note the character of the advertisements under these heads, as reflecting the relative degree of activity in the different trades. At the present time the demand runs heaviest for tinsmiths, roofers and sheet metal workers generally, about two-thirds of the "Help Wanted" advertisements for some weeks past having been for this class of labor. While such a condition is not unusual at this season, the call for sheet metal workers is more than ordinarily pronounced this year, indicating a scarcity of the supply of skilled workmen in this line. Moreover, the applications come from all parts of the country—North, South, East and West being alike represented, showing that the activity of employment in this branch of industry is not confined to any particular section, but is general. This assumption is substantiated by the reports published in the various trade and commercial organs. Not only is the demand for capable sheet metal workers usually active in this country, but at times of special business prosperity it invariably exceeds the supply. This is the case just now. Moreover, it seems that there is a growing lack of properly trained and skilled men in this trade. It would be safe to assume that this is due, in a measure, to the absence of facilities for practical and scientific instruction in sheet metal working, such as are afforded in some other countries. With the exception of the New York Trade School, there is not, so far as we know, another institution in the whole country that is giving a thorough and systematic education in the line of sheet metal working. It is a branch of industry which is constantly expanding. Sheet metal is constantly being put to new uses, and the working of it is becoming a more scientific trade, and the time has arrived when better facilities should be provided for the young men of this country to secure acquaintance with the scientific and technical principles as well as the handicraft connected with this important branch of trade.

Light and Air for Sale.

It has come to pass that the modern skyscraper is giving to natural light and air a value not hitherto associated with real estate assets, says the *Age of Steel*. It is obvious that with abnormally lofty structures grouped in certain districts, that some or others in the family of architectural giants are more or less excluded from such light and air as their boxed up denizens require. Where this is the more painfully realized, it is but a matter of time when the rental value of such offices will decline. This final issue is beginning to arouse the interest of real estate men. As defining the situation, some two or three examples have come to light in New York. In one instance it was proposed to erect a Jacob's ladder building next to one of the modern skyscrapers. This, if carried out, would close the shutters from necessary light, and restrict ventilation or the incoming of fresh air. The owners of the woulb-be darkened structure have been approached with a proposition that the modest sum of $245,000 would secure the light and air privileges of the present open or unobstructive space. This commercial use of natural light and air is not likely to be neglected. If these can be put on the market the men willing to make the best of it are alert and alive, and will be ready to reap where they have not sown, and to gather where they have not strewed. To meet these inevitable conditions a New York contemporary says: "When it becomes necessary to pay out $250,000 simply for light with which to preserve the earning capacity of a piece of property, it is plain that we are approaching conditions that must compel a readjustment of real estate values and methods of construction, if not the laws."

Can Consolidation Succeed?

A prominent stove manufacturer has sent us his views regarding the proposed consolidation of stove manufacturers, asking and answering the above question. What he says will undoubtedly be read with much interest by the stove trade. We may add that he occupies an independent position, not having been identified in any way with the consolidation movement, and enjoys the reputation of having built up a most successful business. He says:

While the subject of consolidation is uppermost in the stove business and all minds are giving it some thought, and many are giving it special attention as well as thought, this very pertinent and all important question keeps bobbing up to each thinker. In the latest proposed consolidation of the stove industry we have the exceptionally rare "start off" by having it suggested and the business of consolidation pushed without a promoter, but by one of the largest producers of stoves, a man of high honor and integrity and one well liked wherever he goes, because he does not have to lie to do his business, but finds the honest truth has always served his ends and those of his house, one who is as straight as he is tall. Without the enormous "rake off" of the promoter and with the simple commission of the financier, the consolidation of the stove industry starts off on the most auspicious basis possible.

If the plan adopted becomes satisfactory and is accepted by the different manufacturers who sell out to the consolidation, and the consolidation is formed on this most unique and economical basis, why shouldn't it succeed? If the president and Board of Directors of the consolidation have the force of character and backbone to throttle in its infancy the game of grab and big salaries to the officers it will succeed. If the president and Board of Directors of the consolidation have force of character and backbone enough to stop their ears and close their eyes to the pleadings for favorites in favored positions at large salaries it will succeed. If the president and Board of Directors of the consolidation have force of character and backbone enough to be a guide unto themselves and steer clear of the rocks that have been disastrous to two combinations in our trade it will succeed.

It is the president and Board of Directors that are put in charge of the consolidation that will make it a success. If they are not of the right kind it will be just like a stove that is not built right, for it won't work right. If the president and Board of Directors will not practice economy in salaries and expenditures in every line, it will not succeed. Salaries that some individual firm may have been able to pay, the consolidation cannot pay as a start off. Why? Because they will have new conditions to meet, new ideas to contend with. They will not have the intense interest of the individual who sold out to help them overcome now what was not a very hard problem to overcome before.

These propositions will cost the administration money, and it should go into the vital, life-giving impulse of the business and not into high salaries, but pay a fair compensation to a competent man who can earn the same salary in any other line.

After one has sold out he means naturally to take things easy. He is not, or should not, be expected to work so hard as he did before, and he won't. Don't pay such a man a dollar he does not earn, if he don't earn a dollar. All the savings in consolidation can be easily wasted, as numerous examples are on record, if economy is not the first and constant watchword in the administration, and with it as the watchword the president and Board of Directors can ride easily and quickly to success. But the word economy must be spelt with all capital letters and the surplus will be greater in proportion than the other noted successful combinations.

Will outside competition hurt consolidation profits? Yes, some, but economical administration will overcome that ten fold, and the outside competition will be felt only for a short time, as the human nature in the stove dealer will soon recover from the shock of purchasing from the consolidation when he finds himself equally as well and perhaps better treated than he was before. He will soon find that he can buy his goods from the consolidation in quantities to suit and prices likewise, and upon a cut and dried form of purchase that he does not have to lay awake nights worrying whether his competitor has purchased another brand of goods for less. He knows he has not, he knows just where he stands, he does not need to worry or speculate.

Can consolidation succeed? It can, but it can only succeed on just the same basis that an individual can. It will succeed in the same way that hundreds of stove men have succeeded. It will do it with less effort and less wear and tear than the individual ever dreamed of, but the watchword must be E. C. O. N. O. M. Y.

The Eastern Stove Trade.

Though there exists some difference of opinion in the stove trade as to the business done so far this year, the majority of the reports contain little that might be considered complaint, and the general view is that it has been satisfactory. In the vicinity of New York the benefit of the old local association is being realized in the freedom with which the individual members of the former body confer as to the advisability of advancing prices. There has been no meeting of the local manufacturers, but the stiffness of prices in the stove market and the quite general advances made show that there is considerable unanimity in the independent advances that have been made in prices and that those now prevailing have not yet been raised to a point that conditions would justify. While there are those who are strongly of the opinion that the year so far has not been a good one among the stove trade, a recourse to order books would show that the output of many plants has been largely engaged. This feature, however, is one of the causes for complaint. It is asserted that Western manufacturers began in January to canvass for business previous to the advances in prices, which have since been made. This example was followed by manufacturers in other fields and some salesmen report that they have already booked orders amounting to as much as their entire sales for last year. Other houses have refused, in view of the indications of advances in iron and labor that have since been realized, to sell goods for delivery after July 1. Still, others have allowed their customers the privilege of placing a portion of their orders for the purpose of protecting themselves against the outcry which is expected when dealers will be compelled to pay the advanced prices which now amount to 10 per cent. over those of last year. The late buyers, with stores of a higher cost, will be forced to compete with those who placed their orders in January at old prices, or at an advance of not more than 5 per cent. The indications, however, are all favorable and the outlook as viewed generally is for a good fall trade. It is to be hoped that the volume of business will then be sufficient to keep all the manufacturers busy and to make things so lively for the dealers that the conditions which have been recounted by some of the best informed stove manufacturers will not have any serious effect.

Death of Henry Perkins.

On the 26th inst. Henry Perkins, who was for many years prominently connected with the stove industry in Ohio, died at the residence of his daughter in New York City. He was born in Akron, Ohio, in 1842, and was the son of General Simon Perkins. He served in the Civil War as assistant quartermaster, and on its conclusion entered the office of the Cleveland Rolling Mill Company. In 1870 he returned to his native city to become secretary of Taplin, Rice & Co. Subsequently he was elected president of the company, and continued to hold that position until his retirement three years since, which was caused by failing health. Mr.

Perkins was deeply interested in Masonry, enjoyed the rare distinction of the thirty-third degree, and in 1889-90 was Grand Commander of the Knights Templar of Ohio. He also served for several years as president of the Board of Trustees of the Masonic Home in Springfield. In 1868 he married Miss Emma White of Cleveland, who attained celebrity as one of the finest soprano singers in Ohio. The remains were taken to Akron for interment.

CIRCULATE THE AIR WITHOUT MOISTENING.

BY W. J. H.

I have been interested in the discussions of "rotation of air" in *The Metal Worker* of late, and have read each article carefully as it has come out. The writer has been advocating that system for several years. Here, in Marshalltown, Iowa, hot air furnaces are used nearly altogether in preference to any other system of heating. The "rotary system" is in universal use, and the people seem healthy and happy.

I have been watching for some things to be brought out in this discussion that no one has seemed to recognize or make any note of—namely: 1, That the fundamental principle in heating a room or a building with a hot air furnace is the circulation of air within that building or room; 2, that there are two distinct ways of securing that circulation, one of which is by the so-called "rotary system," and the other by a ventilating system; 3, that a cold air supply from the outside to the furnace is a part of a ventilating system and has no connection whatever with a "rotary system," as it cannot be used in connection with the "rotary system" without retarding the circulation of air within the building, and circulation, as stated above, is the fundamental principle of heating by a hot air furnace.

The cold air supply from the outside to the furnace can be used successfully in connection with a ventilating flue that has sufficient capacity to carry the air out of the building or rooms to be heated as it is supplied by the outside cold air duct through the furnace, and thus secure the circulation. In this system every room in a building should have a connection from the floor, or by face plate placed in the baseboard near the floor, to the ventilating flue. The ventilating flue, in order to be relied on, must be heated by the smoke pipe or a small furnace, as the case may be, according to the size, &c.

From the foregoing it will be seen that the cold air supply from the outside to the furnace has no connection whatever with the "rotary system," but is a part of a ventilating system (and only a part), and should be used only in connection with the ventilating flue. If either part of a ventilating system is used in connection with the "rotary system," it would be better to use the ventilating flue instead of the outside cold air supply, and especially is that true in this locality, Central Iowa. The "rotary system" is more practical in this cold country than the ventilating system. Further South, and in a warmer climate, the ventilating system would be more practical.

We use the "rotary system" altogether for residence heating. There are hundreds of them in use in this locality, one of which is in a large house owned by Charles Hull in Marshalltown, Iowa. It is heated by a Torrid Zone furnace with no extra water supply in connection. Mr. Hull has had the system in use for three winters. A good many plants are kept in all parts of the house which do fine and thrive, and there is no trouble with frost on the windows as in some systems where too much water is used. I think a nominal supply of moisture, such as you get with nature, is best.

In a great many cases the purchaser is at fault for not having a good system of heating, as he sets the price that he is willing to pay, and in most cases can find some one that will slight the job enough and put the system in for him and guarantee it for his price. He only gets what he pays for, and would get that from the man that would put the job in right and charge more for it. It is a mistake to economize too much on the first cost of a furnace job, for, as a rule, it is poor economy in the end.

A Relic of Colonial Days.

Robert C. Bair has presented to the Historical Society of York County, Pa., an interesting specimen of the earliest iron stoves manufactured in York County. It is a part of one side of a wood stove made at Mary Ann Furnace in 1763. This furnace, says the *Bulletin* of the American Iron and Steel Association, was erected in Manheim township, about 4 miles south of Hanover, on the farm now owned by William Dusman. The relic above referred to was found by Mr. Bair, in 1889, on the property of Dr. H. L. Smyser, of York, Pa. It was uncovered at a depth of 2½ feet below the surface. The plate when found was in two pieces and seemed to have been used as the bottom of a hearth. Upon being carefully scrubbed the fact was revealed that it was part of a side plate of a stove of primitive manufacture. It is nearly an inch thick, and is full of air holes on the back of the cast.

The words "Mary Ann Furnace" came out in bold relief when the clay was removed and also the date "1763," the year of its manufacture. Because this year is thus indicated Mr. Bair concludes that the Hon. George Ross, proprietor of Mary Ann Furnace in 1762, felt great pride in the product of that first year of his industrial enterprise as a pioneer ironmaster and stove founder. It can safely be said, in consideration of other historical circumstances, that if it was not itself the first, it was at least among the first iron stoves made west of the Susquehanna River. George Ross, the manufacturer of the stove of which this relic is a part, was one of the signers of the Declaration of Independence.

The Brecher-Buck Company.

Announcement was recently made of the fact that the well-known manufacturing concern of Fischer-Leaf Company of Louisville, Ky., have retired from the retail business, which they have turned over to the Brecher-Buck Company, composed of the following former members of the first named concern: Charles P. Brecher, formerly vice-president; G. M. Buck, formerly manager, and W. C. McGruder, formerly city salesman. Mr. Brecher is president of the new company; Mr. Buck, vice-president, and Mr. McGruder, secretary and treasurer. We understand that the new concern will continue the retail business at the old stand, 433 to 435 West Jefferson street, but will conduct it upon a much larger scale than heretofore. The store has been remodeled throughout and equipped with electric elevator and other modern appliances. On the first floor are the stove, range and refrigerator departments, while the second floor is devoted to a display of fine mantels and tiling, the latter including foreign and domestic art tiling for floors, wainscoting, &c. The statement is made that the Fischer-Leaf Company will confine their business in the future to that of manufacturing for the trade.

The Magee Star Gas Range.

The Magee Furnace Company, 32 to 38 Union street, and 19 to 27 Friend street, Boston, Mass., have just brought out a handsome gas range, which they are offering in two sizes under the name of Magee Star. It is described as being of new design and as embodying novel features in gas range construction. The drop doors are well balanced; the oven burners are removable, and can be taken out without removing a screw or bolt, while the top burners lift out, thus leaving the top of the stove open and clear of obstruction for cleaning. The oven is square, and in the respective sizes measures 16 and 18 inches. The needle valves are referred to as being of new style, and the range is also fitted with new style wood handle lever cocks.

The company issue a four-page folder calling attention to the Magee Grand, which is a combination range for gas and coal. The gas attachment is such that it can be used in connection with any Magee Grand range, and can be operated independently, or in connection with a coal range, as preferred. It has two Star burners on the main top and two double row burners under the oven.

The oven is asbestos lined throughout, and the broiler is so constructed that both baking oven and broiler can be used at the same time and with the same fire.

We understand that for something like a year past the company have been getting into line for the manufacture of gas cooking appliances, and now have ready a full assortment of first-class goods. At the present time their large line is being built under expert management, and the goods embody features which cannot fail to be appreciated by an intelligent trade. The line includes all sizes and styles of chop broilers, vertical broilers, combination water heaters, independent water heaters, gas attachments for coal ranges, with and without water heaters, &c.

AN OLD COMBINATION HEATER AND VENTILATOR.

Those in the furnace trade who are interested in following the evolution of the original hot air furnace and the best practices of the furnace trade will be interested in the following record of some of the happenings of the past in this field, through the courtesy of W. R. Macdonald, who says:

"Without comment upon the merits or demerits of the antique combination heater shown in *The Metal Worker* of May 3, except to remark that, with a single heat source, it performs in private houses the same duty as is performed in some school houses where a special furnace is used to heat the main upcast flue, while the other warm heaters supply the fresh warm air, the following record is cited to prove the antiquity of the *quasi* 'rotary' system:

"A model of the combined heater and ventilator was placed on exhibition in New York City in 1881 at the American Institute, and the judges, mistaking it for an entirely different system, reported: 'The invention has no special merit. The practice of taking the air from rooms and reheating it and returning it to the rooms is old and has been done for years, and it is not thought desirable.'

"Alfred Beach of the *Scientific American* said of that report: 'Such a report could emanate only from a conceited know-nothing juror.' An amended report was asked for, with the following result:

NEW YORK, June 28, 1882.

Charles Wager Hull, Esq.

DEAR SIR: I have given the matter of W. R. Macdonald's combined sanitary heater and ventilator a very searching investigation in every particular. I find it different from my first idea, and his application of heat in a furnace to foul air flues for the purpose of ventilation is new, as far as my knowledge extends. The application of heat to flues, for producing circulation and ventilation, is old, but I do not know of any furnace so constructed. My opinion is that the construction is an improvement, and the only furnace made that will successfully combine heating and ventilation, and as such should receive the usual award.

Yours truly,
SAMUEL S. UTTER.

I fully concur in the foregoing in regard to W. R. Macdonald's combined heater and ventilator.

JOHN S. BROOKS.

I certify foregoing to be a true copy of the amended report made by Samuel S. Utter and John S. Brooks, who acted as judges on exhibit of combined heater and ventilator.

CHARLES WAGER HULL,
General Superintendent.

July 19, 1882.

"The preceding history," says Mr. Macdonald, "is for the information of *The Metal Worker*, to be made use of or not as it may elect. The writer was in advance of the times. Some of the manufacturers are just that much behind the times. One who did his best to sidetrack the inventor, and really succeeded, is now retired high and dry on a mass of obsolete patterns, and is in an unenviable position.

"I further quote from page 24 of Circular of Information, No. 3, 1891, on 'Sanitary Conditions in School Houses,' issued by the Board of Education, Washington, D. C.:

"'In all methods of heating by hot air furnaces, or by indirect steam or hot water, as much care should be taken to secure the exhaust from the room as is taken to supply the room with fresh, warm air, and this is required for heating alone, as well as for the proper ventilation of the room.'

"'Also on page 9 of the same circular: And in private houses the case is generally even worse than in school houses and public halls. The safety in these houses lies in the fact that but few people generally are confined in one room.'

"The furnace which changes air must in time supplant in private houses steam and hot water installations which do not change air."

In the Matter of Cover Lifters.

Manufacturers of that important appurtenance of all kinds of cooking stoves and ranges and some heating stoves, the cover lifter, will be interested in the following from the Baltimore *American*, which appears to indicate a possible increase in the demand for this humble implement in a field that may create for it a new respect and lift it to the dignity of a weapon, when the woman behind the instrument becomes belligerent. A writer in the paper named was inspired to poesy by a contemplation of the subject. His effort is as follows:

ONE BLOW ONLY.

[Justice Marean of Brooklyn declared yesterday that, under the law, a woman might strike her husband once on the head with a stove lifter and not be adjudged guilty of treating him so cruelly as to warrant a decree of separation.—Newspaper Item.]

When the lady of your bosom
  Thinks that you have rudely miffed her,
She might smite you on the thinker
  With the ever ready lifter.
But be patient, oh, my brothers—
  When the blow comes, gamely meet it—
For you have this legal promise,
  That she will not dare repeat it.

If she seeks to swat you swiftly
  With a leg from off the table,
Or the rolling pin, or carver,
  Speak up softly, kindly: "Mabel,"
(Or whatever else her name is)
  "Know you not the legal sifters
Say that wives may hit their hubbies
  With no other things than lifters?"

If she seizes on a soup bone,
  Or a segment of bologny,
Raise a warning finger at her:
  Say: "You'll lose your alimony!"
Gentle badinage of this sort
  May from her intention shift her—
Anyway, let it be legal;
  Make her stick to the stove lifter.

ODD PLATES.

THE stockholders of the Pennington Foundry & Heater Company, Pennington, N. J., have voted to increase the capital stock from $50,000 to $80,000. The company are running their plant full and have lately largely increased the number of their employees, as well as the volume of their output.

AN exceptionally attractive advertising device is being distributed by the Mount Penn Stove Works, Reading, Pa., in the shape of an oval panel 13 x 9 inches, bearing the clover leaf trade-mark of the Penn Stoves, Ranges and Furnaces in green on a red background with a raised gilt border. The color printing is remarkably effective and the panel is provided with a cord at the top for hanging. It is made of polished sheet steel, the lettering being in gold and white and the whole effect harmonious and striking.

A STRIKE of the molders at the plant of the Richmond Stove Company, Norwich, Conn., which lasted a week, was settled a few days ago. The men withdrew their demand for a 20 per cent. advance in wages and went back to work on Thursday, when the foundry was reopened after repairs.

THE SCATES WARM AIR FURNACE COMPANY, Knoxville, Tenn., who began business in 1881 and came under the present management in 1898, are now not only manufacturing Furnaces, but also erecting them throughout the whole of the Southern States, handling much of their output in carload lots. They make a horizontal return flue steel brick set Furnace as their leader and also a high grade Cast Iron Furnace. A few days ago they shipped a carload of Steel Furnaces to Reickville,

N. C., and within a short time they will ship a carload of the same class to Selma, Ala.

Among the extensive line of trade literature which from time to time is issued by the Monarch Stove & Mfg. Company of Mansfield, Ohio, may be mentioned an eight-page folder illustrating and describing the Monarch Asbestos Lined Ovens, especially intended for use in connection with their extensive assortment of Stoves. The top, sides, back and door are lined with stamped and corrugated tin plate with ⅜-inch space between, filled with the company's patent air cell asbestos, which is claimed to retain the heat within and result in great economy in operation. The drop door forms a strong shelf when open and, although made in four styles and sizes, all the ovens are constructed on the same principle. The peculiar manner in which the ovens are manufactured enables the company to ship them "knocked down," resulting in a saving in freight as well as greatly reducing the liability to damage in transit.

In a little pamphlet which has been issued by the Eclipse Stove Company of Mansfield, Ohio, illustrations are presented of a most interesting line of Coal and Wood Cook Stoves and Ranges, which embody the latest features in the way of ornamentation and construction. Among the many features to which attention is invited are the square oven, oval shaped fire box, duplex grate, removable bottom oven plate, heavy covers and centers, corrugated linings, &c. The goods are made in many styles and sizes, thus adapting them to meet all reasonable requirements.

The Barstow Stove Company of Providence, R. I., are distributing some advertising novelties in the shape of fans which, in view of some of the weather recently experienced in the Eastern section of the country and which may be expected during the coming months, are both timely and appropriate. The front of each fan, which is of irregular outline and consists of a piece of cardboard attached to a wooden handle, is embellished with a picture in colors typifying some event of historic importance. On the other side reference is made to a number of the company's leading Ranges, such, for example, as the Bay State B Six-hole construction, the Bay State Home Grand, the Model B and the New Model Grand. These goods are constructed in a first-class manner, embody the modern features and are ornamented in a style to attract the trade.

The Stove trade of New York City arranged to close their places of business from Thursday night of this week until Monday morning, in order to thoroughly enjoy the holiday season, commencing with the Decoration Day celebration.

At an early hour on the morning of May 17, the extensive works of the Enterprise Stove Company at Vincennes, Ind., which gives employment to more than 100 hands, was visited by fire which practically destroyed the entire plant. The loss is placed at about $150,000, of which $75,000 is said to have been covered by insurance. According to press dispatches, six large buildings were destroyed with fully 10,000 Stoves. The company were established something like 15 years ago. We understand that it is their intention to rebuild the plant.

In a note relating to the Glazier Stove Company, in our issue of May 24, the address of the concern was inadvertently given as Chelsea, Mass. They are located at Chelsea, Mich.

The Prizer-Painter Stove & Heater Company of Reading, Pa., announce, by means of an attractive folder, that they are now occupying their building at 717 Grant street, Pittsburgh. The branch is under the charge of Charles W. Goodnough, as manager. In the display room is shown a complete line of the company's Stoves, Ranges and Furnaces. The warehouse and shipping facilities are the best for good service and it is the intention of the company to carry a large stock with a view of promptly filling the wants of their customers in the Pittsburgh district.

The American Stove & Furnace Company of Findlay, Ohio, have been incorporated with $25,000 capital stock with Frank Weber, president; S. F. Shafer, vice-president and general manager; John Shafer, secretary, and William McGowan, treasurer. The company will locate a factory in Findlay, and will manufacture a Sheet Iron Stove patented by Samuel Shafer. A number of orders have been secured.

At a meeting of the stockholders of the Pittsburgh Stove & Range Company, held in Pittsburgh on Monday, May 19, it was decided that in order to provide funds for the building of a central works at Beaver, Pa., the company would sell several properties which are not needed. These include the Graff works, at Monongahela City, Pa.; Walters works, Sharpsburg, Pa., and other parcels of real estate in the Pittsburgh district. It is the intention of the Pittsburgh Stove & Range Company to concentrate their different Stove plants located in the Pittsburgh district into one large works at Beaver, Pa. Active work on the new plant will be started in a short time.

Retail Hardware, Implement and Vehicle Association of the Indian Territory.

The third annual meeting of the Retail Hardware, Implement and Vehicle Association of the Indian Territory was held in Vinita on May 13 and 14. The first session was called to order in Byrd Ada Opera House at 8 p.m. on the 13th by Vice-President J. G. Smith of Canadian, in the absence of President Mowbray. Hon. Preston S. Davis welcomed the visiting dealers and the convention to Vinita in an eloquent address. Vice-President J. G. Smith responded, after which the convention was addressed by W. S. Thomas, president of the National Association of Implement Manufacturers, on the "Relations That Should Exist Between the Manufacturer and the Retailer." The convention adjourned at 9.30 to the Whitney dining room, where a very elaborate banquet was tendered the convention by the dealers of Vinita.

On Wednesday morning at 9.30 the convention was called to order by President Mowbray. Fred. Parkinson of Wagoner read a very able paper on "Trusts," which was interesting and instructive. This subject was discussed at length by quite a number of the members. Some of those who discussed this subject were: Vice-President J. G. Smith, Mr. Gee of Turner Hardware Company, W. S. Thomas of Springfield, Ohio; M. L. Corey, secretary of the National Retail Hardware Dealers' Association; J. B. McAlister, T. T. Pyle and President Mowbray.

The president appointed the following Committee on Resolutions: A. L. Severance, Fred. Parkinson, John N. McNabb, A. N. Green, E. C. Stretch.

E. C. Stretch of Vinita closed the morning session with an interesting paper on "The Implement Man as a Necessity."

The afternoon work was initiated by J. B. McAlister, who delivered an address on "How to Increase Your Sales."

In the absence of W. H. Durrough, who was on the programme for an address on "How Best to Meet the Competition of Catalogue Houses and Department Stores," Mr. Corey of the National Association took up this subject, and delivered a very able address, which was very much enjoyed by the entire convention.

South McAlister was selected for the next meeting place the second Tuesday in May, 1903.

New Officers.

The newly elected officers are as follows:

President, J. G. Smith, Canadian.
First Vice-President, Fred. Parkinson, Wagoner.
Second Vice-President, E. C. Stretch, Vinita.
Secretary, Sam. R. Frazee, Vinita.
Treasurer, J. B. McBride, Spero.

The following committees were named by the president:

Executive: J. N. McNabb, Wewaka; Ed. Lee, Vinita; A. L. Severance, Durant: A. Gibson, Mounds; J. B. McAlister, South McAlister.

Grievance: T. T. Pyle, Eufala; C. H. Thomas, Chicotah; J. B. Harrison, Afton.

Insurance: Thos. Hamm, Sallisow; Chas. Hunt, Vinita; R. H. Muzzy, Centralia.

The following resolutions were adopted:

Resolved, That we as retail Hardware, Implement and Vehicle dealers, in our third annual convention assembled at Vinita, I. T., declare ourselves opposed to trusts and favor wholesale dealers who are not in such combinations and who protect the interest of the retail dealer; that a copy of this resolution be mailed to all of the wholesale dealers in this section of the country.

Resolved, That we extend our sincere thanks to the past officers for the work so ably performed in the interest of this association for the past year.

Resolved, That we thank the dealers of Vinita for the royal entertainment which we have so much enjoyed since in their city, and for the elaborate banquet served by them.

The meeting then adjourned *sine die.* After adjournment the delegates enjoyed a tally-ho ride around the city as the guests of E. C. Stretch.

Arkansas Retail Hardware Dealers' Association.

The Arkansas Retail Hardware Dealers' Association will hold their third annual meeting at Little Rock, on June 18 and 19. An interesting programme has been prepared, including papers and discussions on a number of important topics. Among the papers which will be read are the following:

"What Effect Will the Combine of Large Hardware Companies Have on the Retailers?"

"The Most Important Things in Conducting a Hardware Business."

"Fakes and Fakirs, or Leg Pullers."

"Cash Registers *vs.* Cash Drawer."

H. D. Hull's Fiftieth Anniversary.

On the 13th inst. H. D. Hull, wholesale and retail dealer in hardware, stoves, house furnishing goods, &c., Troy, N. Y., completed his fiftieth year of mercantile life. Mr. Hull, who was recently elected president of the newly organized New York State Association of Retail Hardware Dealers, is now in the seventy-second year of his age. During his long and successful career he has witnessed many changes in trade, of which he writes as follows:

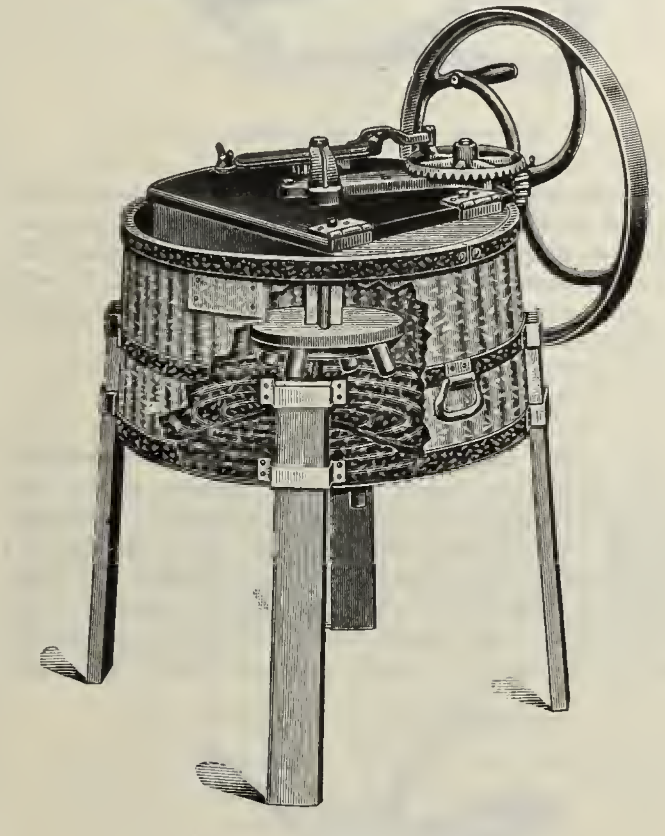
> What changes have taken place in my small sphere in the one-half century which I have been permitted to do business! Scarcely a man now doing business in this town who was then here and active. Either gone to their reward beyond the flood, where all must eventually go, or have taken Horace Greeley's advice, "Go West, young man."
>
> The manner of doing business has also greatly changed. Time was when each department of business had its own legitimate channel, and each person in business attended to his own affairs and all were happy and content. Each could make a good living, and customers were more content than now. Now all is changed. Trusts are being formed, even in the very necessities of life.
>
> Again, large stores are springing up, using goods which do not belong to their department of business, and cutting the very life out of them, in numerous cases having only samples to attract, and if a customer should ask for a quantity their reply would be, "We are just out." The retail dealers' associations hope in time to relieve this situation and teach the people they can buy the same goods directly through the regular channel and and not from illegitimate sources at equally as low prices and run no chances of getting swindled.

W. W. Luebkeman has lately embarked in business at Eau Claire, Wis., handling a line embracing Shelf and Heavy Hardware, Stoves and Tinware, Sporting and Athletic Goods, Mill Supplies, Paints, Oils, &c. Mr. Luebkeman will conduct both a wholesale and retail business.

Geo. F. Johnson & Son have succeeded G. F. Johnson in the Hardware, Stove and Sporting Goods business in Redfield, S. D.

The U. S. Steel Washing Machine.

The accompanying cut represents a galvanized steel washing machine put on the market by the United States Washing Machine Company, Chicago, Ill. The washer is of the rotary type, and the power is transmitted, it is remarked, in a manner as novel as it is effective. The speed of the pin wheel is variable, starting and stopping slowly, the speed being greatest midway between these points. It is explained that the variable speed secures the greatest possible agitation of the water, that it produces the smallest amount of wear on the parts and that it does away with the jar incident to the constantly changing direction of the pin wheel. The machine is right or left handed, as turning the crank in either direction produces the same motion of the pin wheel. The cover is made of two-ply wood and is secured to bolted hinges. When the cover is lifted it carries the fly wheel to one side, giving ample room to get at the interior. The sides and bottom of the washer are corrugated, producing a wash board surface. The joints are double seamed. There are three galvanized hoops securely riveted; the top hoop overlaps the top edge of the tub to make a smooth finish and to add to the general strength of the tub. The tub is galvanized after it is made, which is alluded to as an important feature. A fine quality of heavy sheet steel is used, it is stated, and after being put together and carefully seamed, closing all joints and uniting all parts, including the hoops, leakage is impossible. The wringer space will hold a large size wringer. The cover and legs are made of hard wood, nicely finished. The legs are secured by riveted cleats, and the machine weighs 65 pounds, so that it can be lifted and moved around. It is pointed out that the washer can be thoroughly cleaned, that it can be left in the sun all the week in the hottest and dryest climate; that there is not a crack for dirt to lodge or germs to collect; that the washer will not splinter or fall to pieces, and that it is always clean, sweet and satisfactory.

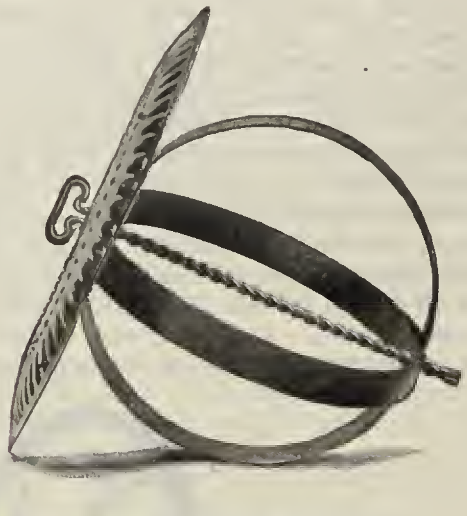


The U. S. Steel Washing Machine.

Witte Hardware Company, Aberdeen, S. D., have been incorporated with the following officers: A. C. Witte, president; Otto E. Mueller, vice-president and treasurer, and Arthur L. Mueller, secretary. They are successors to A. C. Witte in the wholesale and retail business in Shelf and Heavy Hardware, Stoves and Tinware, Sporting Goods, &c. The company have built a two-story brick addition, 25 x 62 feet, and also a warehouse, 25 x 140 feet, thus adding materially to their facilities.

The Perfect Flue Stop.

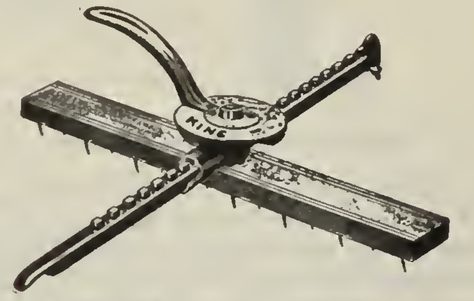
G. A. Higgins & Son, Galesburg, Ill., are manufacturing the patent Perfect flue stop illustrated herewith. The makers claim that this flue stop overcomes all objections found in other devices of the kind on the market. It is easily and firmly fastened in place by turning the rod in the center of the stop, and is so constructed that rust will not prevent the easy removal of the flue. These flue stops are manufactured in three grades: No. 1, with ornamental cover and two hoops; No. 2, with japanned cover and two hoops, and No. 3, with japanned cover and one hoop.



The Perfect Flue Stop.

The King Carpet Stretcher.

The carpet stretcher shown herewith is offered by the W. E. Sitterly Novelty Works, Auburn, N. Y. The stretcher consists of a metal bar, swiveled to a wooden cross head. The small knobs on the top of the bar are round, between which semicircles, underneath the round part of the handle, work. The teeth underneath the wooden cross head are on a slant so as not to tear the carpet. The handle is center draft, so that it locks and holds itself wherever the operator stops the handle. In use the hook at the end of the bar is driven in the floor near the base board, and the teeth in the cross head are pushed into the carpet. The handle is then turned to the right, which draws the cross bar toward the hook, thus stretching the carpet. The carpet is tacked, the stretcher is then moved along, and the operation is repeated. The cross head working on a swivel so adjusts itself to the carpet that the carpet is stretched where it most needs it. The manufacturers state that every piece of casting is warranted, and that they will replace any that break.



The King Carpet Stretcher.

Morse Hardware Company, wholesale and retail dealers in Hardware, Ship Chandlery and Metals, Stoves, Sporting Goods, Iron and Steel, Mining, Mill, Fish Cannery and Lumbermen's Supplies, Lime, Cement, &c., Whatcom, Wash., are about to erect a new building, which will have a frontage of 56¼ feet and a depth of 115 feet, with three floors, including basement. The establishment will contain all modern improvements. A railroad switch directly in the rear of the building will enable them to unload from car to basement floor. The constructing material will be of a fine grade of sandstone and hard brick. The steady growth of their business has compelled the company to erect this building, which will fully double their present floor space. The present quarters will in the future be used as the wholesale department.

Stove and Hardware Dealers.

The Fanner Mfg. Company, Cleveland, Ohio, have just begun the manufacture of Arctic Fruit and Vegetable Presses. These are Hand Presses, and are made in two shapes. They are referred to as made of first-class material and well tinned.

B. W. Crone has bought the Hardware and Stove business of W. J. Ohlheiser, at Juniata, Neb., and will continue at the old stand.

James Alexander, dealer in Hardware, Farm Implements, Stoves and Buggies and Wagons, Orchard, Neb., has lately moved into a new building.

D. A. Utiger is successor to Mackay & Utiger in the Hardware, Stove and Farming Implement business in Mena, Ark.

Hoy & Schroeder, Hardware dealers, Postville, Iowa, have been succeeded by Schroeder & Stone. The firm are dealers in Shelf and Heavy Hardware, Tinware, Sporting Goods, Stoves and Furnaces, Plumbing and Gas Fitting Supplies, &c.

John Eilerts has lately opened a store in Charlestown, O. T., handling Shelf Hardware and Tinware.

Webb Bros. have succeeded M. W. Webb in the Hardware, Stove, Agricultural Implement, Sporting Goods, Wagon and Buggy business in Itasca, Texas. In the fall the firm will build a Harness and Saddle factory.

The quantity of soot discharged into the air by soft coal used as fuel is very great. An English chemist took a sample of snow, which had been lying in the streets of Manchester for ten days, melted it and discovered that the residuum weighed at the rate of 3 tons per square mile. Forty-eight and six-tenths of this was pure carbon, six and nine-tenths heavy oil and grease, the remainder being ashes. Thirty tons of soot mixed with 2 tons of grease to make it stick well to buildings, distributed over city limits generally is an appalling amount, and accounts for the dingy appearance of thoroughfares. Dr. Knecht of the London Technological School also experimented in the same direction upon snow that had been exposed nine days, and found three times as much soot, possibly because three times the amount of coal had been burned in the vicinity.

The gas pipe industry has been given a tremendous "boost" in the United Kingdom by the approaching coronation. Gas tube makers and gas fitters all over the country are reported as crowded with work in the preparation and placing in position of gas tubing for illumination purposes. There is an immense demand for devices in the shape of crowns, coronets, royal monograms, loyal mottoes, &c.

M. Toch of the New York Society of Chemical Industry gives the following recipe for a paint for iron, which he claims will outwear red lead: Seventy per cent. of barytes, 10 per cent. of carbon black, 10 per cent. of zinc oxide and 10 per cent. of graphite ground in pure linseed oil containing a sufficient quantity of driers. If this paint and red lead are each painted over a rusty surface, says Mr. Toch, scales of rust will break through the red lead much more quickly than they will through the black paint containing barytes.

A French savant and inventor has recently been trying some interesting experiments with acetylene gas as a source of high temperature. He finds that, with the non-luminous flame produced, enough heat is generated to melt platinum in a few seconds. By the process he employs the disadvantages of the electric furnace and the oxyhydrogen blowpipe are altogether avoided.

CONFERENCES IN THE PLUMBING TRADE.

Although not an assured fact, available reports indicate the strong probability of a conference in the plumbing trade. Some time since President Hornbrook of the National Association of Master Plumbers and Chairman Torrance of the National Committee of the Confederated Supply Associations, met in the Auditorium Hotel in Chicago, and discussed the advisability of holding a conference with a view to adjusting the differences which exist between the master plumbers and the supply trade. The meeting was a purely informal one, but it has resulted in a movement which may culminate in a meeting between the executive committees of these two bodies at Atlantic City on June 13 and 14.

It is well known in the trade that the master plumbers substituted what is known as the Cleveland Resolutions for the New York Conference Resolutions, and that the National Committee of the Confederated Supply Associations shortly afterward had a meeting in Chicago and adopted what is known as the Chicago Resolutions. These sets of resolutions are somewhat at variance, and, in a measure, irreconcilable. One of the principal features of the Cleveland Resolutions is the lack of any provision for conference or arbitration on matters of difference. Conservative plumbers recognize that a substantial measure of trade protection is enjoyed by them. The manufacturers, on the other hand, recognize and support the principle of trade protection; consequently, there should be no difficulty in reaching an agreement that would be mutually satisfactory. All that is required to accomplish this is a disposition to make concessions in minor matters, rather than to rigidly adhere to the different positions already taken by the two bodies. It is to be hoped for the good of the whole trade that the strain in the relations now obtaining between the two interests will be removed. No benefit is derived when two all important branches of any industry or trade are operating under an armistice.

◆

Andrew Carnegie, Plumber.

Andrew Carnegie has been admitted to membership in the plumbing fraternity on the other side of the water, the freedom of the Worshipful Company of Plumbers having been presented to him with due ceremony, in the council chamber of the Guildhall, London, on May 14. The casket containing the freedom is of silver, bound with steel and ornamented with steel and enamel. It is a reproduction in miniature of an ancient muniment chest belonging to the company, and containing its ordinances (drawn up in the reign of Edward III), which was saved from the great fire of 1666. One of these ordinances, by the way, is to the effect that the competency of a plumber shall be certified "by assent of the best and most skilled man in the trade testifying that he knows how well and lawfully to work, and to do his work so that the trade may not be scandalized or the commonalty damaged and deceived by folks who do not know their trade."

The casket stands upon four steel supports, and in front bears the lines from George Herbert,

> Who shuts his hand hath lost his gold,
> Who opens it hath it twice told,

in enamel. The key is of gold, the head being in the shape of a thistle set in jewels. Within the lid of the casket is a rising sun in gold with the motto "Let there be light" (which is supposed to be Mr. Carnegie's favorite quotation), and the arms of the United States and of Scotland. The casket contains a lead box made by T. L. Pitt, one of the company's registered plumbers. The box is constructed with burnt seams, the bottom being formed of the obverse and reverse of the company's medal, also in lead. The three materials (silver, steel and lead), of which the casket is made, represent, respectively, the conventional metal of city caskets, the metal out of which Mr. Carnegie made his fortune, and that especially associated with the craft of plumbing. The inner box contains a certificate of freedom and a copy of the resolution of the court conferring that freedom upon Mr. Carnegie.

ASSOCIATION NEWS.

Manhattan Branch Arrangements for Atlantic City.

The delegates elected to represent, at the Atlantic City Convention, the Manhattan Branch of the Master Plumbers' Association of Greater New York, held a meeting and organized with President A. H. Brown as chairman. Various committees were appointed to attend to special convention business. The Transportation Committee, composed of John Mitchell, Jonas A. Rossman and Frank Reynolds, have arranged with J. Heroy of the Central Railroad of New Jersey to go to Atlantic City by that route. A special train will leave New York on Monday, June 16, at 3.40 p.m., and the fare for a 15-day round trip ticket will be $4.75. The committee have also made arrangements for a special rate for delegates at the Hotel Rudolf.

The Master Plumbers' Association of Bridgeport, Conn., have elected the following delegates to the convention of the National Association of Master Plumbers, to be held in Atlantic City, June 17-19: J. T. Brady, L. H. Mills. M. W. Manwaring and F. C. Booth.

The advance reports from all sections indicate that the Atlantic City convention of the National Association of Master Plumbers will be a large one. It is a long way for the Western men to come, but it is said that they have interests to look after that will bring them East in full force.

Some effort will be made to secure a more even representation in the new officers of the National Association. This year all the officers and a majority of the cabinet are from the West. These facts may be the basis of interesting developments.

The East is undisturbed in the enjoyment of what seem to be satisfactory relations between the plumbers and the supply trade; but late reports come from Chicago of a complaint to the Government authorities against the National Association. The count contains numerous charges.

An Electric Heating Device.

A system of heating houses and cars which combines the hot water and electrical systems, says the Boston *Transcript*, has been devised by a New Haven inventor. It is claimed to represent high efficiency and to give a uniform and most pleasant heat. The heater itself is made up of but few parts and is yet durable and inexpensive. It is composed of castings which form the connecting heads and circulating flue or water chambers, around which are placed the electric coils of high resistance. The latter are perfectly insulated by lava and specially prepared cement. The heads of the castings are made to receive iron plates, which are held in place by screws, and form a casting around the coils. The heat is controlled by a switch made to use in connection with this heater, and with its use the current is reduced without the aid of any external resistance, thereby keeping all the heat within the heating apparatus. In the application of this system the electric water heater is placed in the cellar in place of the ordinary coal burner, the rest of the plant being the same as with the ordinary water heating installation. The controlling switch may be located in any part of the house that may be desired, from which point the temperature of the entire structure may be regulated. The convenience of such a system will be apparent to any one. There is no handling of fuel or ashes, and there is also the advantage of instant adjustment. The principle has been applied to the radiator with an expansion tank and pig and circulating pipes, thus forming a portable electric heating system with a flexible cord connection with the electric light bracket.

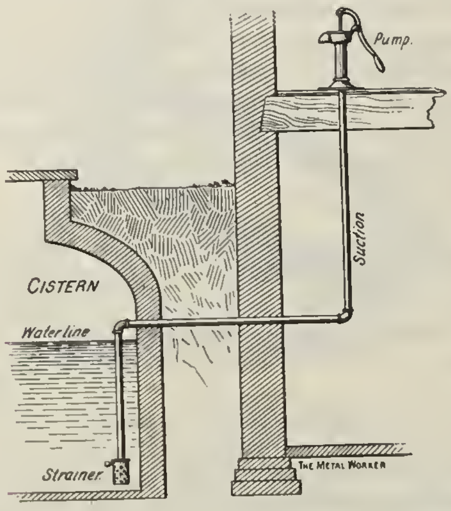
A FIRE visited the plumbing establishment of M. Chrystal at Summit, N. J., last week

HOUSE PUMP SUCTIONS.

BY HELMAR

House pump suctions vary in the method of installation, according to conditions. Ordinary lift and lift and force pumps trip the lower and basket valves by merely lifting the handle as high as it will go, thus draining the suction, discharge and pump cylinder, unless there are check valves in the pipe. On force pumps, if there is a valve in the air chamber or discharge, a pet cock must be tapped in below it to drain the pump and suction, and means for emptying the discharge must be made, if it is desired to drain it at all. No pump should be expected to lift water satisfactorily over 25 feet vertical lift. The suction must be air tight and as free of abrupt turns as possible.



House Pump Suctions.—Fig. 1.—Pitcher Pump with Set Screw Strainer.

Cisterns are often the source of supply. The cistern bottom is usually arched upward to prevent water pressure from cracking it. If the suction pipe drops in the center of such a cistern a closed bottom strainer resting on the cistern bottom is sufficient, or the end of the suction pipe may be tapped and plugged and perforated near the bottom with small drilled holes aggregating ample area to supply the suction pipe. If the suction runs down at one side of the cistern, as shown in Figs. 1 and 2, it must be kept several inches above the bottom, so as to keep it free from the accumulation of sediment which drifts toward the inclosing wall. On long runs and extra high lifts a foot valve is sometimes placed on the end of the suction. In such cases the suction cannot be drained by lifting the pump handle alone, but it may be drained back to below freezing point by placing a stop and waste or three-way cock in the suction, in the ground between the cistern and the house, as shown in Fig. 2. This cock must first be turned off and then the handle of the pump held or propped up long enough to permit the suction to empty.

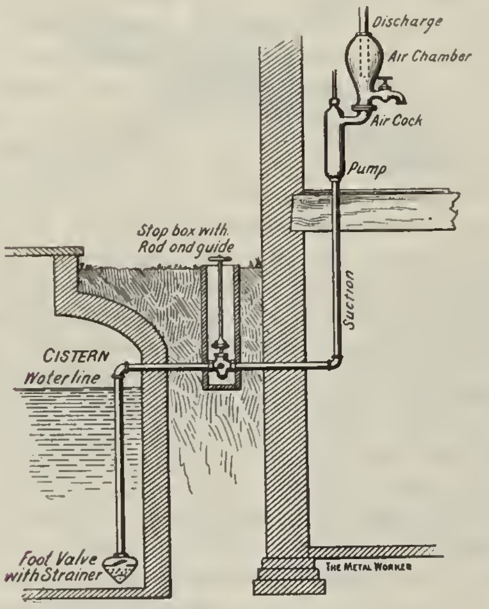


Fig. 2.—Force Pump and Connections.

A stop and waste takes much longer to empty the pipe than does a three-way cock, because the waste hole is small.

Where the pump suction is taken from the street supply in order to elevate water to a tank for use on the upper floor, as is done when the street pressure is inadequate, a piece of pipe larger than the usual house service is wiped in and the suction branched into it, as shown in Fig. 3. An air chamber is set upright on this enlarged part. The street pressure compresses the air in the chamber and partly fills it with water. This surplus of water is available to supply the pump suction more rapidly and uniformly than the low pressure street service could without such a reservoir to draw from. The chamber maintains its surplus by filling, while the down stroke of the pump is being made. The chamber should have an air cock in the top, so that it may be refilled with air if necessary. When the pump suction is taken from the house service a check valve should be placed on the street supply to the range boiler, otherwise the use of faucets may interfere or water may be sucked from the boiler.

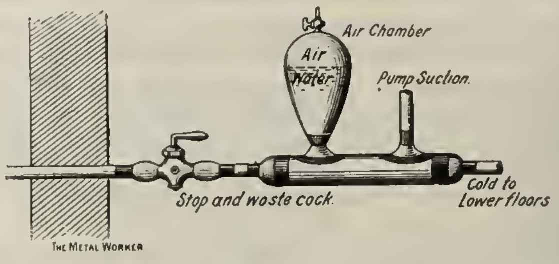

Fig. 3.—Service Pipe Enlarged for Pump Suction Reservoir.

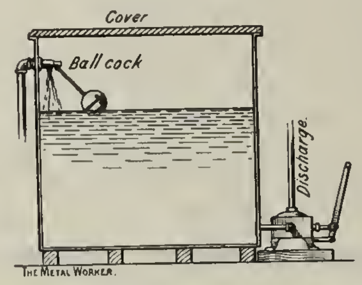

Fig. 4.—Pump Connected with Suction Tank.

To avoid excessive pressure street supplies are sometimes turned into a basement tank, as shown in Fig. 4, the tank being covered (not air tight) to keep out foreign matter, and the supply controlled by a ball cock in the tank operated by the rise and fall of the water. The pump suction is taken from near the bottom of the tank. The pump then fills by gravity, and the labor of pumping includes only that of lifting the water to the house supply tank. This is also true of pumping from the street service, unless the pump overtaxes the capacity of the service.

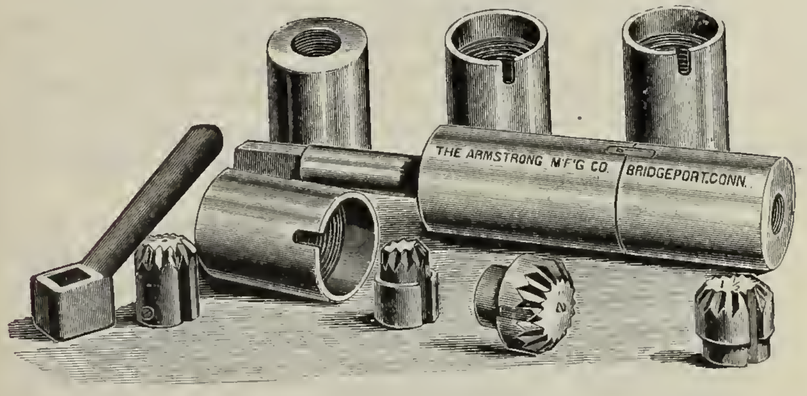
The Richmond Boilers.

An especially fine catalogue has been issued by the Richmond Stove Company, Norwich, Conn., devoted to the Richmond line of steam and hot water apparatus. The cover shows one of the new Richmond magazine feed heaters in red, while the words " Richmond, Heaters That Heat," are embossed on the brown surface. These words also occupy the left hand corner at the top of each page. The catalogue is printed in two colors, and opens with a very interesting explanation of the construction of house heating boilers. The special features of the new line of large sized Richmond heaters is the provision of a magazine, so that the boilers are either surface burning or magazine feed, at the desire of the purchaser. The magazines are said to hold sufficient fuel to maintain the fire from 36 to 48 hours. By means of general and broken views and views of the boilers partly assembled, with the different parts, the construction and the fire travel may be readily understood. Diagram cuts are also presented, so that the arrangement of the various parts can be fully comprehended. These boilers are made in nine different sizes, composed of from 4 to 12 sections, with grates 30 inches wide and rated to carry from 600 to 1800 square feet of direct steam radiation, and from 1000 to 3000 square feet of direct hot water radiation.

The last portion of the catalogue is devoted to round Richmond boilers. These are made for both steam and hot water, with grates 18, 21, 24 and 27 inches in diameter. Smaller heaters are also made designed for smaller work, such as heating water in storage tanks for supplying apartment houses, for greenhouse work and similar purposes. The catalogue is a fine piece of trade literature, and in the new self feeding vertical sectional boilers presents an apparatus which will be studied with interest by the heating trade.

The Armstrong Nipple Holder.

The nipple holder shown herewith is made by the Armstrong Mfg. Company, Bridgeport, Conn., to be used in connection with their No. 00 pipe threading machine. It holds pipe from 1 to 4 inches inclusive by using different threaded rings and backing pieces. It will also hold close nipples either right hand or left hand, no change of parts being necessary to hold the nipple for threading it left hand. When the thread is cut the nipple can be removed with the fingers by loosening the screw in the back of the holder. This nipple holder can be furnished to hold pipe as small as ¾ inch if required.



THE ARMSTRONG MF'G CO.
BRIDGEPORT, CONN.

The Armstrong Nipple Holder.

The Standard Sanitary Mfg. Company in the South.

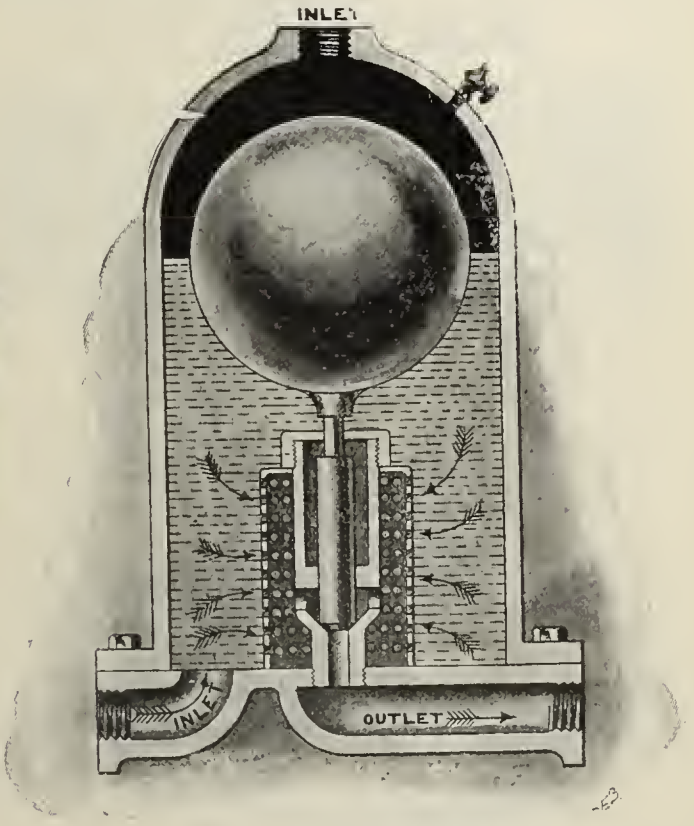
The ownership of the property at the corner of Baronne and St. Joseph streets, New Orleans, La., says the *Picayune* of that city, is no longer a mystery. It is known that the purchasers are the Standard Sanitary Mfg. Company of Pittsburgh, Pa., one of the largest manufacturers of plumbers' supplies in the country. Ahrens & Ott, who have been carrying on business here for the past two years, at the corner of Common and South Peters streets, and with two other warehouses, may be said to be the house here. It is now proposed to put all the local business under one roof. Jules Tschopik, manager of the New Orleans house, has given out the following information:

The style and proportions of the building will be determined from Pittsburgh. The land is 160 x 160. The site is not only central to the business portion of the city, but the location is one which is passed by a vast number of people, and affords a fine opportunity to show goods. We do not sell to consumers, but to plumbing establishments and dealers. Our aim is to have the public see what sort of goods we have and to afford our customers an opportunity to examine them. We will begin the construction of the building as soon as the examination of titles, &c., is perfected, and intend to be located there by the first of the year. The building will be a handsome one, of mill construction.

J. W. Cuff & Co., Philadelphia, bid $4488 and secured the contract for installing the heating plant in the Landreth School in that city.

A Low Pressure Grease Trap.

Since the custom of utilizing exhaust steam for heating and other purposes has become so general, and the return of the condensation to the boiler is a common practice, the necessity for some method of separating the grease from the condensation to prevent its detrimental effect in a boiler has been recognized, and has led to the production of appliances for this purpose. In the accompanying illustration is shown a new low pressure grease trap manufactured by Kieley & Mueller, 7 to 17 West Thirteenth street, New York City. The sectional view renders the operation readily understood. With this trap the condensation rises until the float is lifted directly off the valve seat, there being no intermediate lever or connections. Surrounding the valve and its outlet is an internal strainer pipe, by means of which all matter that should not pass through the valve is prevented from passing and lodging on the seat. The trap is made in two parts, an upper shell and a bottom plate. As all the pipes are connected with the bottom plate the upper shell can be readily taken off and the parts cleaned without disconnecting a single pipe, should the trap at any time become actually filled or stopped with dirt. The area of the valve is very large in proportion to the low pressure under which it is designed to act; consequently it has a large discharging capacity. It is made for all sizes of pipe from ¾ to 3 inches in diameter, and is capable of taking care of the condensation from 4000 to 50,000 lineal feet of 1-inch pipe.



A Low Pressure Grease Trap.

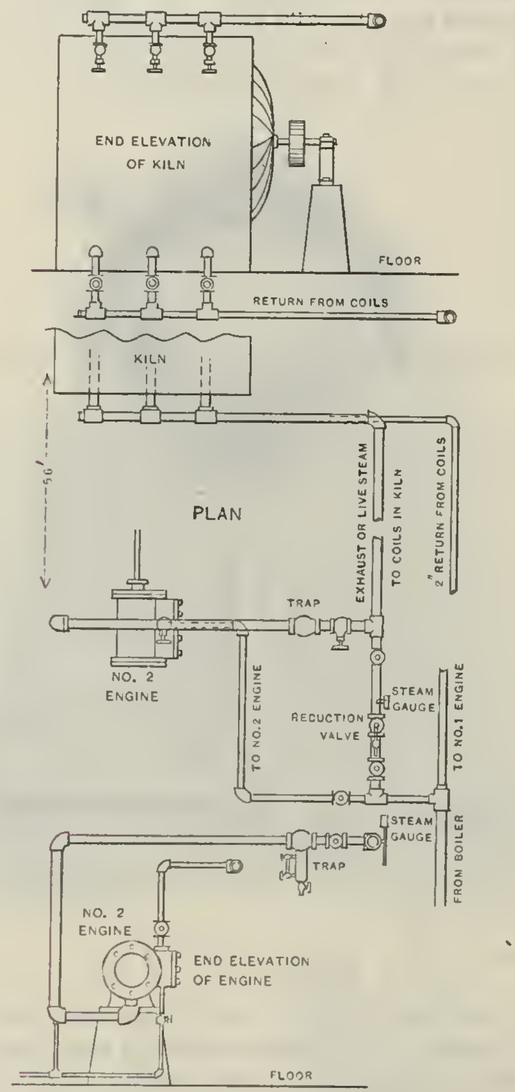
Disk Fans.

The American Blower Company of Detroit, Mich., have sent us a copy of their 38-page catalogue, No. 140, devoted to A B C disk ventilating fans. The company state that there has been an increase in the demand for disk fans for ventilating all types of buildings; not only in large buildings where a change of air is necessary to maintain purity, but also in factories for the removal of smoke, noxious fumes, gases, steam and dust, and for cooling overheated apartments, also for drying apparatus. The engravings in the catalogue show various types of these fans, with the different parts removed, so that the construction and operation, whether to be set horizontally or vertically, can be readily understood. The fans are shown designed to be driven by pulleys or direct connected engines and electrical motors. For the various fans there are tables giving full dimensions and their capacity. The last pages of the catalogue contain tables giving useful information for all who must figure up the various work that must be made in the installation of fans and the piping used in connection with them. The last four pages show hot blast apparatus, pressure blowers and mechanical draft systems for use in connection with boilers.

"KINKS" THAT CONFRONTED A STEAM FITTER.

BY "SID."

Early last spring a certain corporation, too small probably to be called a trust, but still having an absolute monopoly on their line of goods, decided to leave a city where they were dictated to by unions, and paying city taxes could only declare a quarterly dividend of 9 per cent., and move to a town where they could get a free site, "cheap" labor and "unlimited" water power. So their general manager picked out the town, leased his water power and reported that he could build and install a plant of double their former capacity for a certain amount of money in three months. At the end of the time the building was not done, to say nothing of installing machinery, &c.; four months more, not done yet. At the end of five months the general manager (by the way, the G. M. was a dentist by trade and no doubt was a "drawing" card at that business, but as the head of a manufacturing concern was a dismal failure) reported great progress, but said that the money was nearly gone and he was very sorry, but he would need at least double the amount to complete the mill. Then there was consternation among the directors and the president was sent to investigate. He came, he saw and nearly fell dead. Then he relegated the G. M. to the rear, with orders to assume a semi-recumbent position. The president appointed in his place a fine, clear headed business man, who, although not a practical mechanic, knew what he and the mill wanted.



THE METAL WORKER

Kinks that Confronted a Steam Fitter.

It was at this stage of the game that the writer was called in as consulting engineer. In his 25 years of all round experience he never saw anything like it, but will try to tell something of it. To illustrate: The "unlimited" water power was on an island and there was installed the generator, without any governor. The power was carried over on cables to three motors. The largest motor, designed for No. 1 shaft, was set in the basement wedged in between a pulp beater and a wet paper machine, where there is a constant spray of water and from ½ inch to 6 inches of water on the floor all the time. But this is mild compared to some of the "kinks."

The G. M. wished to tear everything out and start right. He was not allowed to do so, but ordered to get out some material any old way, so as to satisfy the directors. So by hook and crook and strenuous ten-hour a day work we got the mill ready to run (?) in three weeks. They started up, and the first move was to burn out the generator. Another delay. Meanwhile we were doing the best we could to straighten out the "kinks" in the pipe work and the weather was becoming so cold that steam heat became necessary, when along came an order for economy. "Too much skilled labor." "Pay rolls too big." "Must use up old material.". "Cut down your bills," &c. So the steam fitters were discharged and we were forced to use as fitters men who could hardly tell a 45-degree ell from a pair of chain tongs. But as we are blessed with a good pair of lungs and have a large assorted vocabulary of pet words, we did not mind this so much. But when it is "hurry, hurry," to have to use old pipe and fittings is —well, no picnic.

At last they started up, and it was found that the water wheel would not furnish power for lights and the large motor, to say nothing about the other two, while No. 1 engine was set so it could not couple on to the main shaft. So we were obliged to run another line of shafting and divide the power. This was O. K. until we got heat in the building. Then, as was expected, we found the boilers too small, although the condensed steam, exhaust and all, was returned to them. By using forced draft and hard work we managed to keep running. The came the freeze up in the river and down went the water power. This, they found out, was the regular thing every winter and no one depended on their water wheels.

Well, something had to be "did" and that sudden and somewhere. In some scrap heap the G. M. found an engine and she was a curiosity. Well, we set her up and then came the question, "From where will you get your steam to drive her?" The boilers were already overloaded and could not stand any more. We got around this by piping her as per sketch, which, of course, does not show the swing joints for expansion or other small matters. As will be seen, we take our live steam so as to by-pass the reducing valve, and run our exhaust line back into a live steam line to the kiln. The coils in the kiln are 56 feet from No. 2 engine and are 1½-inch return bend pattern, 30 pipes high and 10 feet 8 inches long. They are divided into three eight-branch coils. They were laid out for live steam only, as will be seen by the size of the return—2 inches. The cold air is forced through the coils by a 6-foot fan.

The questions we had to answer were: Would we be able to maintain the requisite heat in the kiln with exhaust steam? Would not the back pressure on the engine be excessive? We solved the first question by regulating the speed of the fan, the cold air and the ventilating ducts. To overcome the second we by-passed the trap and connected the return direct to the suction of the boiler feed pump, between the pump and the receiving tank, so that the back pressure is so light it will not show on a low pressure gauge.

I am pleased to report that the corporation have decided to install a high class steam generating plant and drop the "unlimited" water power.

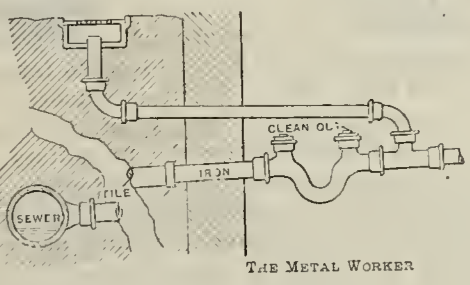
Hanlon & Murphy of Hartford, Conn., have the contract for plumbing the new hospital building in that city.

A Popular Form of Sewer Connection.

The various methods of making sewer connections prevailing in different places have been given in *The Metal Worker* from time to time. The form of connection most generally used and recommended by a majority of sanitary engineers, particularly where large brick main sewers are possible, involves the use of the front wall or intercepting trap, and it is also used in many cases where terra cotta sewers are laid. Our readers will find some interest in the practices followed in this work in different cities, as described in the following letters:

A plumber in Newark, N. J., says:

In connecting with the sewer in our city, salt glazed tiling is carried from the street sewer to a point within 5 feet of the building line, where extra heavy cast iron soil pipe is connected and carried inside the wall. At this point an extra heavy cast iron running trap is placed, provided with two hand holes for cleaning out. Into this opening we calk clean outs for screw ferrules. Just inside of the trap we place a tee branch, from which we run a 4-inch fresh air intake to the curb, or some other convenient point away from any window. Outside of the building good salt glazed pipe may be used with perfect confidence, and it should be connected above the ordinary flow level in the sewer, using good Portland cement at the point of connection and for sealing all the joints in the pipe. Of course, extra heavy cast iron soil pipe makes a very substantial job, but it is unnecessary except in quicksand or marshy soil. When tiling is used, however, care should be taken to see that it has a good solid bed and is properly supported. The drain should have a pitch of not less than ¼ inch to the foot all the way from the house to the sewer, to insure satisfactory flow and disposal of the household waste. Our method of connecting the house drain with a sewer, locating the running trap and the fresh air inlet pipe, is shown in the accompanying sketch (Fig. 1). In my opinion there is no objection to the use of the front wall trap. If the opening in the wall through which the soil pipe runs is protected by means of cement and crushed stone on the inside it will prevent surface water from running down the wall and entering the cellar.



A Popular Form of Sewer Connection.—Fig. 1.—A Newark, N. J., Connection.

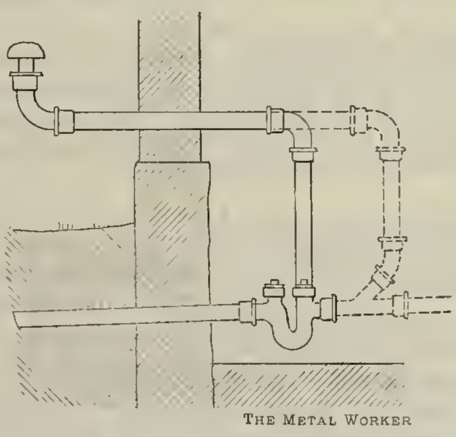


Fig. 2.—Showing the Practice in Barre, Vt.

A correspondent of Barre, Vt., presents in Fig. 2 the method of connecting the intercepting trap and fresh air inlet followed in that locality. Glazed terra cotta pipe is carried to within 5 feet of the house wall when cast iron soil pipe is used. The opinion is expressed that a sewer should be entered by the house drain with the same pitch that it has when it leaves the house, regardless of how deep the sewer may be, and the grade should never be less than ¼ inch to the foot. The solid lines in the sketch show the way that the fresh air inlet is ordinarily connected, while the dotted lines show what is considered a better way.

A plumber in Bay City, Mich., writes that the main sewers are in the middle of the streets, with laterals extending to the alleys. Some of the main sewers are made of brick and others of large salt glazed tile. In connecting the house sewers with the brick ones, openings are left for this purpose, generally on the sides of the mains, although sometimes on the top. These openings are, of course, closed until ready to receive the house sewer connection. The laterals connect with the main sewers always by means of Y branches. Glazed tile is carried from the sewer to within about 5 feet of the house, when cast iron soil pipe is taken, and just inside the wall, where it is readily accessible, a double hub running trap is generally used, the inside hub being used for the fresh air inlet connection, as shown in Fig. 3. This is carried up outside the building as far from the windows as possible, and is covered with a vent cap. The other opening in the trap is closed by means of a brass hand hole with a screw for the clean out which is going into the opening. The fixtures connected with the house drainage system are all provided with traps, and these traps are back vented. The drain pipe from the house is generally laid with a pitch of at least 1 inch in 10 feet, or more, if it can be had, and the connection with the sewer is made just a little above the center if the sewer is deep enough to allow it.

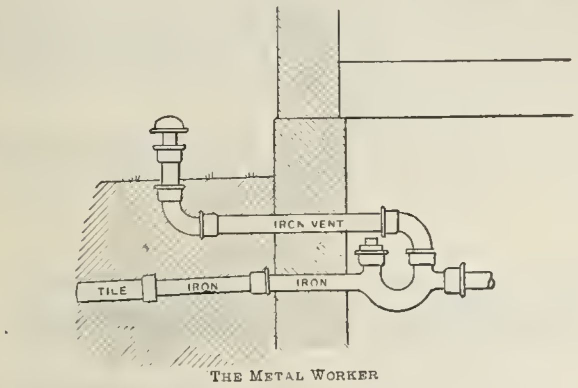

Fig. 3.—A Bay City, Mich., Connection.

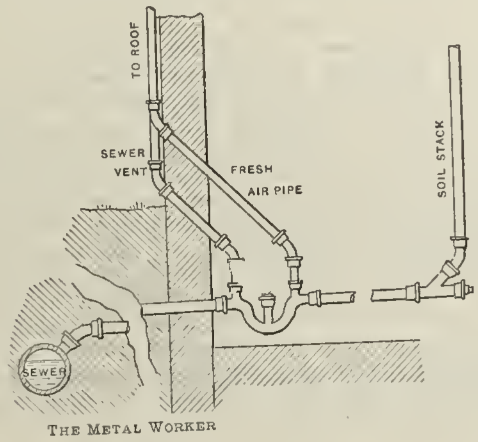

Fig. 4.—A Unique Connection Used in Seattle, Wash.

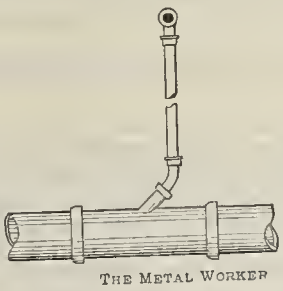

Fig. 5.—A Top Connection to a Terra Cotta Sewer.

A plumbing house in Seattle, Wash., state that it is the practice there to use glazed terra cotta pipe in connection with the sewer wherever circumstances will permit. The connection with the sewer is usually made at a point above the water level, and is given a pitch from the building of not less than ¼ inch to a foot, and more if possible.

In order to prevent water entering the cellar at the point where the pipe passes through, the outside wall is covered with cement. In order to separate the main sewer from the building a running trap is used, and to avoid the disagreeable odors that arise from the fresh air inlet, two pipes are carried up from the openings on the running trap to the roof of the building, as shown in Fig. 4. This ventilates the sewer and also the drainage system in the building.

A correspondent in Webster, Mass., explains methods of making sewer connections which have been found satisfactory in his experience. The process of making connections with the main sewer, which in smaller towns is quite generally made of terra cotta pipe, is explained as follows:

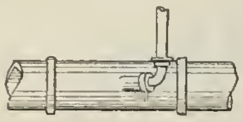

Fig. 6.—A Connection to a Side Branch.

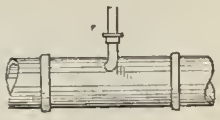

Fig. 7.—House Drain Connected by Cutting Hole in Main Pipe.

> In this section many of the sewers are laid from 12 to 18 feet deep, or deeper. When such sewers are laid branches to receive the house drain should be brought to within 7 or 8 feet of the surface. A Y should be placed in the main sewer, looking up to receive the vertical branch, as shown in the sketch herewith (Fig. 5). The vertical branch should be connected with the Y by means of a ⅛ bend. Where the main is not so deep—only 7 or 8 feet—it should be provided with a small Y branch on the side, so that by means of a ¼ bend the vertical drop to the house drain can be connected, as shown in Fig. 6. Sometimes a tile sewer is laid without an opening being left to receive the house drain. When it is necessary to tap the sewer, as shown in Fig. 7, an opening is cut by means of a cold chisel, care being used. This opening should be made to receive a long sweep 16 bend. The connection should be made above the water level in the sewer, and the joint at the point of connection should be carefully cemented and firmly supported.

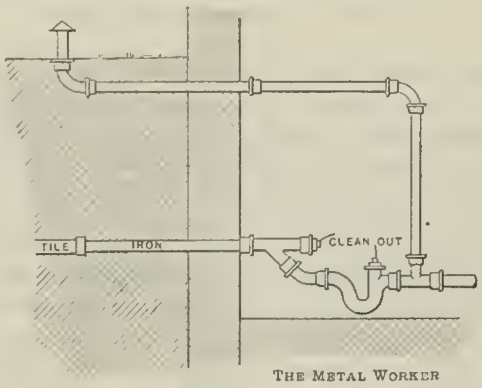

Fig. 8.—The Front Wall Connection.

> The house drain may then be run with glazed terra cotta pipe from the sewer connection to a point within 10 feet of the cellar wall, and should have a pitch of not less than ¼ inch to the foot. From this point extra heavy cast iron soil pipe should be carried through the front wall, and a Y connected with it, as shown in Fig. 8. One of the openings should be closed by means of a brass plug with clean out screw, being calked into the hub with lead. This should be on a straight run of the pipe, so that, in case of an obstruction, a rod can be used to open the drain. The other branch of the Y should receive a deep seal running trap made of heavy cast iron with a clean out opening on the house side.
>
> Two feet inside of this trap on the house side a tee should be placed for connecting a fresh air inlet to extend outside of the building above the surface of the ground, and covered with a cap to keep it from becoming clogged. The outer end should be so located that it will not discharge the foul air near any window or door. This fresh air inlet will protect the seal of the running trap by allowing air to escape from the house drain ahead of the water from fixtures that are flushed in the building. Where the cast iron pipe passes through the wall of a building the opening should not be tight around the pipes, but an arch should be left to allow for settling. Concrete or cement should be placed on the outside of the wall over where the pipes are laid, to prevent surface water soaking through.

Proposed Consolidation of Lead Pipe Manufacturers.

The reports current for some weeks past in regard to a projected consolidation of the various manufacturers of sheet lead, lead pipe and other manufactured lead products have become more circumstantial during the past week. It is claimed in some quarters that the project has advanced substantially and that 10 or 12 concerns engaged in this branch of manufacture are likely to become merged into a corporation with a capital of $15,000,000, which new company are likely to be in shape for incorporation under the laws of New Jersey at an early date. Inquiry in the trade elicits the fact, however, that several of the leading concerns engaged in the manufacture of lead products apart from white lead are unlikely to enter into a combination of this kind. Moreover, it is rumored that important lead pipe interest in the West, who are said not to have been considered by the promoters of the consolidation, have announced their intention of invading the Eastern market should the consolidation be formed. These interests, it is thought, would prove too strong competitors to enable a consolidation of the Eastern manufactured lead interests to be successful, especially if some of the larger manufacturers in the East are not parties thereto. Under these conditions the success of the efforts for a consolidation are regarded in the trade as decidedly problematical. The announcement of the practical consummation of the scheme, which appeared in some of the New York papers, is regarded as decidedly premature. It is quite likely that the whole project may fall through again, as it has done more than once in the past.

New York City Notes.

After spending many months of unceasing search and making inquiries by aid of United States consuls and commercial houses all over the world, Paul S. Bolger of 378 Park avenue at last found his son, Walter, this week on board the United States Training Ship "Franklin," at Norfolk Navy Yard.

⁂

William H. Cranston, who was formerly a well-known Third avenue master plumber and who has been living at 93 West 134th street, died last Saturday. Mr. Cranston was a member of the Master Plumbers' Association and many other societies.

⁂

Trade still continues to pick up. Frank Vermilyea has a large apartment at the corner of Broadway and 112th street, T. A. Hill is well along with a 12-story apartment hotel on Twenty-fifth street west of Broadway, Heuston & Corbitt have a large apartment at the corner of Broadway and Seventy-seventh street, Louis H. Wenzel has two private houses at Fifth avenue and Eighty-eighth street, Joseph Black has two apartment houses on 115th street east of Eighth avenue, John Frick has two tenements on Seventy-fifth street near Avenue A, Gerald Donnelly has a factory building on Fifty-sixth street near Eleventh avenue, and Thomas F. Gillick has a storage warehouse at 421-425 West Thirteenth street.

A LETTER from the Kennedy & Sullivan Mfg. Company, 73-75 Main street, Holyoke, Mass., informs us that, having agreeably adjusted the questions which induced them to discontinue the steam and hot water business branch of their business, they are now, as in the past, prepared to furnish all of the apparatus needed in a heating system, and also to install them at short notice. The company will be glad to receive from manufacturers of goods in this line their lowest quotations and trade literature.

Dial and Needle Point Valves.

The use of gasoline has been and is growing fast, and it is now being used to do all manner of work about the house or factory, furnishing heat, light and power. It is a well-known fact that ordinary valves, adapted for use on water or steam, are not suitable for the handling of gasoline. Ground key valves are also of little value, as valves of this style do not give proper control of the flow and soon leak. Fifteen years' experience and a disposition to make the best gasoline goods has enabled Clayton & Lambert Mfg. Company of Detroit, Mich., to make needle point valves that are said to be efficient in every way. Two new dial needle point valves which they have recently added to their line are shown herewith. By their use a close regulation can be had so that the flow of gasoline can be controlled. The valve shown in Fig. 1 is a ¼-inch female globe valve and that shown in Fig. 2 is a male valve. Each is constructed with a needle point and seat to regulate the flow of gasoline and has a dial to record the relative distance that it is open.

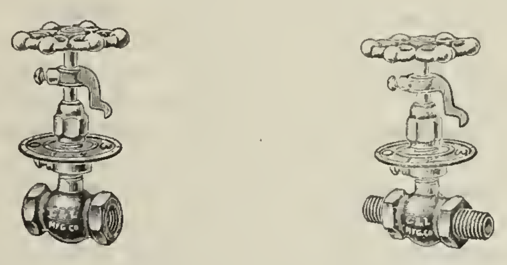

Fig. 1.—Female Valve. *Fig. 2.—Male Valve.*

Dial and Needle Point Valves.

Heating and Plumbing Notes.

The Horn & Brannen Mfg. Company of Philadelphia bid $10,000 and secured the contract for supplying the electric light and gas fixtures in the Central High School building in that city.

The Heating & Lighting Company of Norwalk, Mass., have the contract to place two Kelsey Warm Air Generators in the new school house at Westport. The plant will be provided with a ventilating system for changing the air frequently.

Samuel J. Kelly of New York City has been at Racine, Wis., with a view to establishing a Plumbing Supply manufacturing plant in that city.

J. H. Jordan of Philadelphia, Pa., bid $3756 and secured the contract for a new drainage system for the school at Bridesburg.

The Central Foundry Company, 116 Nassau street, New York City, have recently booked an order for 100 tons of Cast Iron Soil Pipe, varying from 2 to 6 inches in diameter, for shipment to the Philippines.

The United States Heater Company of Detroit, Mich., have recently rearranged their showroom at 127 Worth street, New York City, and now have samples of a varied line of Steam and Hot Water Heaters which they manufacture under the name Capitol, including everything from a Tank Heater to the round sectional Mascot Heaters and the large heavy duty vertical sectional Capitol Boilers of the latest design. Manager W. S. Newkirk and his assistant, C. F. Young, invite the trade in the vicinity of New York to examine this line and become familiar with its many features of merit and convenience to the steam fitter and the user.

In laying a new underground trolley system on Greenwich street, New York, the workmen uncovered, 4 feet below the surface, an old water main, consisting of a string of pine pump logs. The logs were 20 feet in length, having a bore of 4 inches, and were in good condition, except that the outer surface was rotten. It is said that these pipes are part of an old water system constructed by Aaron Burr.

The Aurora Acetylene Gas Company, Chattanooga, Tenn., have been awarded a gold medal on their machine at the Charleston Exposition. We are advised that they are getting more orders for their machine than their present capacity will permit them to fill.

The Acorn Brass Works, Chicago, have increased their capital stock from $50,000 to $100,000, and also increased the number of directors from three to five.

Cornell & Underhill, 43-47 Beach street, New York, sales agents for Spang, Chalfant & Co., announce that they are now prepared to furnish all sizes of Wrought Iron Pipe and Boiler Tubes from ⅛ to 20 inch, the Spang-Chalfant plant having been increased by an addition to the mill. The company are also equipped to cut all sizes of Pipe up to 18 inch, and desire to figure on sketch work and specifications.

William Lumb, one of the prominent plumbers of Boston, Mass., celebrated his eighty-third birthday last Saturday. Mr. Lumb is an Englishman by birth and an American by adoption, coming to America in 1840. He is a member of the British and Scotch charitable societies, of the Ancient and Honorable Artillery Company and a Mason of high degree. He is in remarkably good health.

W. M. Anderson has the contract to install a $6000 hot water heating system in St. Joseph's Orphanage, Philadelphia.

Andrew Young, Chief Sanitary Inspector of Chicago, is supporting an objection to a provision of an ordinance which requires a special appliance to be used in connection with waste pipes and sewers. It is claimed that the ordinance of the Health Department would require a connection, costing $3; whereas, the method of making the same connection in the usual way costs about 35 cents.

C. P. Vanderveer, who is well known to the heating trade, has engaged with Serrell & Schenck, 322 Broadway, the New York representatives of Warren, Webster & Co., Camden, N. J., manufacturers of Feed Water Heaters and Exhaust Steam Specialties.

The many friends in the heating trade of Judson A. Goodrich of the Judson A. Goodrich Company, 105 Beekman street, New York, will be glad to learn of the improvement in his health. He has been confined to his house for several months with a serious illness, but is now fast recovering his strength, and expects soon to be at his office attending to business as heretofore. He thanks his many friends in the trade for their substantial remembrances of him during his absence.

New Firms and Changes.

The Sunlight Lava Mfg. Company, Chattanooga, Tenn., have acquired the patents, business, &c., of the Sunlight Acetylene Gas Burner Company. Under new management and with increased facilities and improved apparatus the company will continue the manufacture of Tips for coal gas burners, acetylene burners, electric insulators, &c.

The American Plumbing & Mfg. Company of New York City have been incorporated with a capital of $25,000. The directors are: Henry H. Sommer, Bartholdi Sommer and Jacob Schattman of New York.

The Pittsburgh Valve & Fittings Company, Pittsburgh, Pa., have been incorporated with a capital of $200,000 by A. E. Anderson, Howard O. Turner and Guy D. Wallace.

The Steele & Robinson Company, who have recently been incorporated at Williamsport, Pa., with a capital of $50,000, will remodel the plant formerly used for making the Backus Heater, to suit their business. They will engage in the manufacture of Gray Iron Castings, Radiators and Steam and Hot Water Heaters, and expect to employ 50 men. George P. Steele has been elected president and general manager, and will have charge of the business and reside in Williamsport. William J. Robinson is the secretary and treasurer, and will have charge of the office and salesroom in Philadelphia.

The Norman Smoke Consumer & Fuel Company have been incorporated, with principal office at 419 Market street, Camden, N. J., to manufacture Boilers, Furnaces, &c., with a capital of $25,000. The incorporators are: F. R. Hansell, Geo. H. B. Martin and Wm. F. Eldell.

Pattern for Coffee Pot.

(Without Allowance for Laps.)

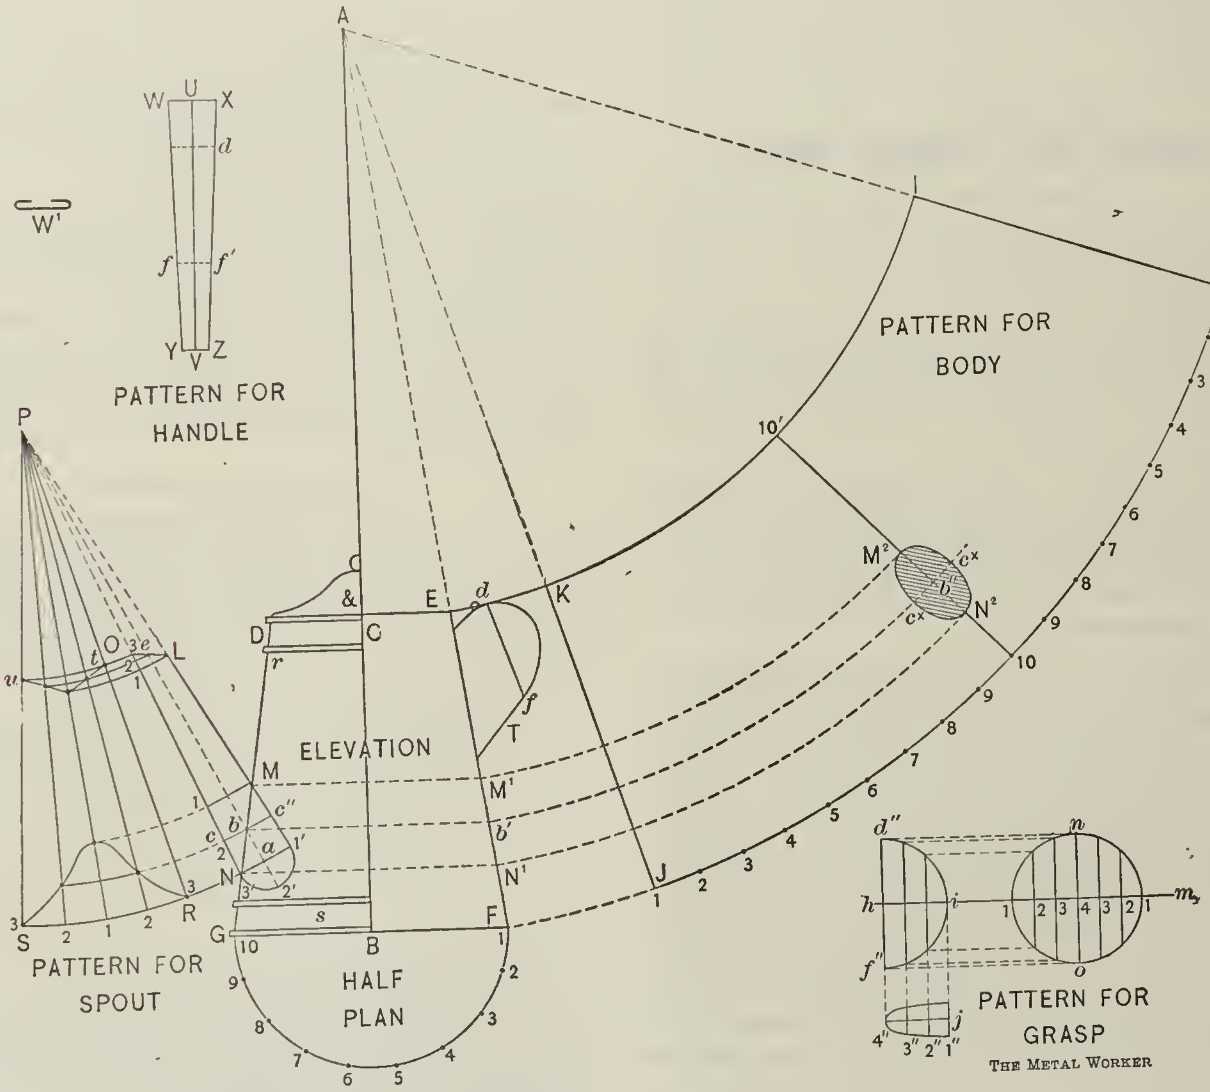
It often happens that a customer desires some special piece of tinware made that is not kept in stock, such as a coffee pot of IXX tin. A persepective view of such an article is shown in Fig. 1. Patterns of this kind that are developed should be preserved for future use.

In developing the patterns proceed as shown in Fig. 2. First draw any vertical line, as A B, upon which place the hight of the coffee pot, as B C. At right angles to B C draw the top diameter D E and the bottom G F, placing one-half diameter of each on either side of the center line, as shown. Now draw the lines D G and F E, extending F E until it intersects the center line A B at A. Then will A be the center point from which to strike the pattern. Now, with B as center and B F as radius, draw the half plan of the bottom F 6 G, which divide into equal spaces, as shown by the small figures 1 to 10. With A as center and radii equal to A E and A F draw the arcs J H and K I, as shown. From J draw a line toward the apex A, intersecting the arc K I at K. Now, starting from the point J, lay off on J H the stretchout of twice the amount of the half plan G 6 F, as shown by the small figures 1 to 10 to 1 on the arc J H. From H draw a line to the apex A, intersecting the arc K I at I. Then will I H J K be the pattern for the body of the pot.

Pattern for Coffee Pot.—Fig. 1.—Perspective View of Coffee Pot.

In its proper position draw the outline of the spout, as shown by L M N O, intersecting the body of the coffee pot D G at M and N, while L O represents the opening of the spout at the top. Now extend the lines N O and M L until they intersect each other at P. Now, using P as center and P N as radius, describe the arc N 1′, which intersect by the line L M extended at 1′. Draw a line from N to 1′, which bisect and obtain the point *a*. Then, with *a* as center and *a* N as radius, describe the semicircle shown, which divide into equal spaces, as shown by 1′, 2′ and 3′. In practice more spaces should be employed. At right angles to N 1′ and from 2′ draw a line intersecting N 1′ at *a*. From *a* draw a line to the apex P, intersecting D G of the pot at *b*, and O L of the top of the spout at *e*. Now at right angles to the center line P *a* and from the intersections at the bottom of the spout M *b* N, and at the top at L *e* O (which represent respectively points of intersections obtained from 1′, 2′, 3′ in the semicircle), draw lines intersecting O N of the spout at 1, 2, 3, at the top and bottom of the spout respectively. Now, using P as center and radius equal to P N, describe the arc N S. At any point, as R, draw the line R P. Starting at the point R set off twice the amount of spaces contained in the semicircle 1′ 2′ 3′, as shown by 3 1 3 on R S. From the points 3, 2, 1, 2, 3 on R S draw lines to the apex P. With P as center and radii equal to P 3, P 2, P 1, P 1, P 2, P 3′, on O N of the spout, draw arcs intersecting radial lines of similar numbers, as shown. Trace a line through points thus obtained; then will *t u* S R be the pattern for the spout.

It will be noticed that we have not taken into consideration the fact that the spout intersects a round surface, but have assumed that it intersects a plane surface, as D G. The difference in the pattern is so slight that it will not be noticeable in practice. Had we developed the pattern according to the true geometrical



The Metal Worker

Fig. 2.—The Pattern.

rule it would present a problem of two cones of unequal diameters intersecting each other, and require a little time, while the short rule employed answers the purpose just as well where the spout is of so small a diameter.

For the pattern for the opening to be cut into the body to receive the spout proceed as follows. From the point 10, or the center in the pattern for body, draw a line toward the apex A intersecting the arc K I at 10′. Now from the intersections M *b* N between the spout and body draw lines at right angles to C B, intersecting the opposite side of the body E F at M^1 b' N^1. Then, using A as center and with radii equal to A M^1, A b' and A N^1, draw arcs intersecting the center line 10 10′ of the pattern at M^2, b'' and N^2. Through b'' at right angles to 10 10′ draw the line c^x c^x. Now, through the intersection *b* between the spout and the body and at right angles to the center line P *a*, draw the line *c* c'' intersecting the sides of the spout O N and L 1′ at *c* and c'' respectively. Now take the distance of either *b c* or *b* c'' and place it as shown in the pattern for body from b'' to c^x on either side. A line traced through the points M^2, c^x, N^2, c^x, will be the required opening.

After the body is rolled up and seamed a bead, shown at *r* and *s* in elevation, can be put in to make a neat finish. The bottom G F is seamed in the usual manner, while the cover & is a pressed cover, which can be bought ready made with hinge attached, or a flat or pitched cover can be made by hand.

A plain flat handle is shown by *d* T, which is laid out by drawing any vertical line, as U V, upon which lay off the stretchout of *d f* T of the handle. At right angles to U V draw W X and Y Z, the width respectively of the top and bottom of the handle, and draw the lines W Y and X Z. Then will W X Y Z be the pattern for the handle, to which a hem dge, as shown at W^1, should be allowed.

The grasp is shown by *d f* in elevation, and in an enlarged view by d'' f'', *j* representing the true section through *h i*. Care should be taken that the width of *j* is not more than *f* f' in the pattern for the handle. Now divide the profile *j* into an equal number of spaces, as shown by the small figures 1″ to 4″. From these points and at right angles to *h i* draw lines intersecting the curve d'' *i* f'', as shown. Extend the line *h i* as *h m*, upon which place the stretchout of *j*, as shown by points 1 to 4 to 1 on *i m*. At right angles to *i m* and through the small figures draw lines, which intersect with lines drawn from points having similar numbers in d'' *i* f'', at right angles to d'' f''. Trace a line through points thus obtained; then will *n* 1 0 1 be the pattern for the grasp. The letter *d* in elevation shows a small button which is soldered to the handle and prevents the thumb from slipping when in use.

Carnegie Sheet Steel Company.

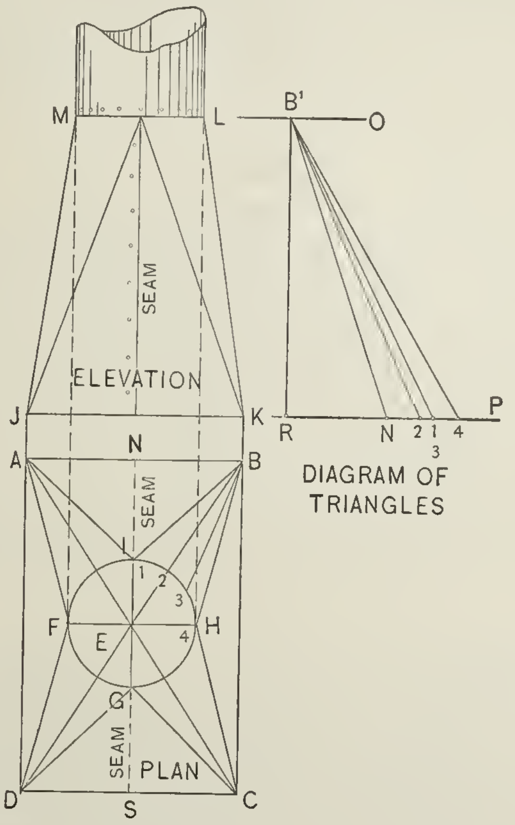
The Carnegie Sheet Steel Company of Pittsburgh will let contracts in a few days for a six-mill plant, to be erected at West Carnegie. Two basic open hearth steel furnaces, with a capacity of about 125 tons per day, will be installed. Work will be commenced on contracts at the very earliest possible time and pushed to completion as rapidly as conditions will permit. The plant will be in no way connected with the Carnegie Tube Company. The Pittsburgh Construction Company will do the grading and put in the foundations. Edward E. Erikson, consulting engineer, of Pittsburgh, has been given the contract for two 25-ton basic open hearth furnaces, and the American Bridge Company will erect the buildings.

THE stockholders of the Atlanta Rolling Mill & Tin Plate Company met in Atlanta, Ind., on Wednesday, 21st inst., and elected the following Board of Directors: J. M. Whisler, L. C. McFatridge, Henry Roads, Wm. H. Marker, H. B. Hibbin, Henderson Coppock and J. A. Mitchell. The following officers were chosen: President, J. M. Whisler; vice-president, Henry Roads; treasurer, E. S. Walton; secretary, John Kesler, and manager, Walter Jones. The company, we are advised, will be ready to do business after June 2. It is not their intention to repair, or use in any way the American Tin Plate Company's mill or building at Atlanta, but they will erect a plant that will be new in every part.

Pattern for a Two-Pieced Stack.

To develop a pattern for a two-pieced stack having a rectangular base and a round top proceed as follows:

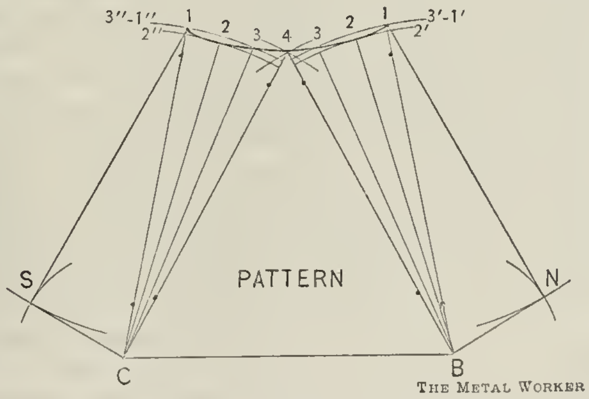
In the accompanying illustration, the chimney measures 14 x 21 inches and the stack is to taper to 6 inches.



THE METAL WORKER

Pattern for a Two-Pieced Stack.—Fig. 1.—Plan, Elevation and Diagram of Triangles.

In this connection it may be proper to remark that no matter what size the chimney has, or to what size the stack tapers, the principles hereinafter explained are applicable to any case, whether the top opening is central over the rectangular base or to one side. In Fig. 1, let A B C D represent the size of the chimney. Draw the diagonals A C and B D, intersecting each other at E. As the 6-inch pipe is to come directly in the center of the chimney use E as center, and with the required radius describe the circle F G H I. In its proper position above the plan draw the elevation J K L M; although this is not necessary in the development of the pattern, so long as the hight of the article is known.



THE METAL WORKER

Fig. 2.—The Pattern Shape.

Draw the two diameters, F H, and G I in the plan, as shown, and from F and I draw lines to the corner A; also from I and H, H and G and G and F draw lines respectively to the corners B, C and D. As the four corners are symmetrical only one corner pattern will be required. Divide the quarter circle I H into an equal number of parts, as shown by the small figures 1 to 4, from which draw lines to the apex B. Then will these lines represent the bases of triangles, whose altitudes or hights equal the hight of the stack, as shown in elevation.

To obtain these triangles proceed as follows: Extend the lines J K and M L in elevation, as shown respectively by J P and M O. At any point, as R, at right angles to K P, draw the line R B^1. Now take the various distances from B to 1, to 2, to 3, to 4 in plan, and place them on the line K P, as shown from R to 1, to 2, to 3, to 4, and from these points draw lines to the apex B^1. Then will these slant lines represent the various true lengths on similar numbered lines in the plan. Assuming that the seam will come on N I and G S in plan, then take the distance of N I or G S and place it as shown by R N in the diagram of triangles, and draw a line from N to B^1, which gives the true length on N I or G S in plan.

For the half pattern of the stack proceed as follows: Draw any horizontal line, as C B, in Fig. 2, equal to C B in plan in Fig. 1. Now with radius equal to B^1 4 in the diagram of triangles and B and C in Fig. 2 as centers describe arcs intersecting each other at 4. Draw lines from 4 to C and 4 to B. Now with radii equal to B^1 1, 3 and 2 in the diagram of triangles in Fig. 1 and with B and C in Fig. 2 as centers describe respectively the arcs 3′ 1′, 2′ and 3″ 1″, 2″, as shown. Now set the dividers equal to the spaces contained in H I in plan in Fig. 1, and starting from the point 4 in Fig. 2, step from one arc to another of similar numbers on either side, thus obtaining the points 3, 2 and 1 on both sides. Through these points trace a curved line, 1 4 1, and draw a line from 1 to C and 1 to B. Now, using 1 and 1 as centers with a radius equal to B^1 N in the diagram of triangles in Fig. 1, describe the arcs S and N in Fig. 2, which intersect by arcs struck from B and C as centers and with radius equal to N B or C S in plan in Fig. 1. In Fig. 2 draw lines from 1 to S to C, also from B to N to 1. Then will 1 4 1 N B C S be the half pattern for stack, to which laps must be allowed for seaming or riveting. When bending the stack bend on the lines in pattern in Fig. 2 shown by the dots.

Stowell Mfg. Company's Prepared Roofing.

Stowell Mfg. Company, 114-134 Culver avenue, Jersey City, N. J., manufacturers of roofing materials, have just added an entirely new covering material to their regular lines of such roofings, which will be known as Mica-Slate roofing. It consists of a single ply of high grade double thick asphalt saturated felt, the top surface of which is also covered with asphalt and a combination of mica and slate ground together, which makes an especially suitable roof covering. An important feature of it is the comparatively low price at which it is sold, which in effect is about the price of ordinary three-ply coal tar roofing felt, nails and caps being included in the price of the Mica-Slate roofing. Aside from the greater lasting qualities of asphalt treated felt, this roofing is a finished product, so that the cost of labor to coat the three-ply tarred roofing is saved as well as the material for coating the surface.

A feature of the various roofings made by this company is that nothing but genuine Trinidad asphalt is used for saturating, cementing and covering the various prepared roofings, which are put up in rolls of 108 square feet (40 feet by 32 inches), technically known as a "square," and capable of covering 100 square feet net of surface, exclusive of laps. What is claimed for asphalt saturated felt is that it remains pliant and elastic for years, does not get brittle or crack, is odorless, and will give good results for two or three times the period that coal tar products do without recoating.

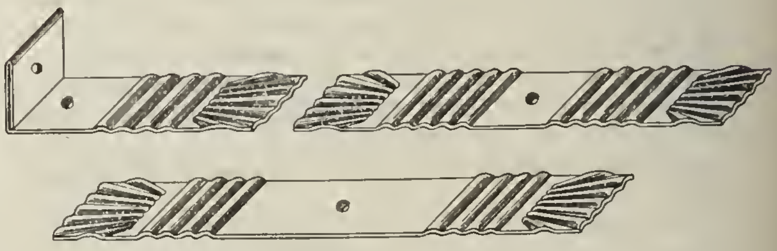
The company also make superior grades of asphalt saturated and coated ready roofings, consisting of two thickness of felt cemented with asphalt, the coverings being gravel, cork and asbestos, the several kinds having distinctive features that commend them to the trade.

In this connection they also make an asphalt saturated roofing felt, Nos. 30, 40 and 60, single ply, to be used in the same way as coal tar coated paper with which it competes. This plant makes 50,000 square feet of ready roofings of the kind described in a day's run.

In a separate factory nearby they have a paint making plant for producing absolutely pure asphalt paint, which is warranted to contain no coal tar in its composition. They particularly recommend it for painting metal roofs or covering old shingle roofs, smokestacks, iron bridges and iron or steel structural work generally. Another related product they manufacture is an elastic rubber cement, which is used by tinners for flashing and by slaters for imbedding slate in the laying of a roof. They deal in No. 1 refined Trinidad asphalt, Trinidad asphalt roofing cement and Trinidad asphalt paving cement. The roofs of the great buildings of the Fore River Ship & Engine Company, Quincy, Mass., who are building several war ships for the United States Government (among which are the battle ships "New Jersey" and "Rhode Island"), are covered with the gravel prepared roofing made by this company.

Taft's Improved Metal Wall Ties.

We present herewith illustrations of what is known as Taft's improved wall ties, now being manufactured and placed on the market by R. C. Taft, Room 5, Columbian Building, Topeka, Kan. The ties are made of galvanized iron of a gauge suitable for the purpose and are corrugated in the manner indicated in the engravings. The construction is such as to render them especially adapted for hollow or double walls as well as for brick veneer construction. The tie in the upper left hand portion of the engraving shows how the end is bent at a right angle and perforated for fastening to the frame or wooden support. The illustration shows so clearly the construction of the ties that extended description would seem to be unnecessary.



Taft's Improved Metal Wall Ties.

FLASHINGS.

The journeymen cornice makers of New York City have notified their employers that, beginning with September 1 they will expect to receive $4 per day wages and a half day off on Saturday the year round with full pay. At present they are getting $3.75 a day, with a half day off on Saturday for three months of the year without pay.

Tracy Coit died on May 23 at his home, 237 West 126th street, New York City, after a lingering illness. He was born in Connecticut 63 years ago, and in early life served in the United States navy; afterward he went into the canned goods business, and later became a dealer in Sheet Metals.

The Schratweiser Fireproof Construction Company of Brooklyn, N. Y., have been incorporated under the laws of New Jersey, with a capital of $250,000, to manufacture Fire Proof Construction Work, including Schratweiser's patent Metal Lathing. The incorporators are Jacob Schratweiser, Christian Schratweiser and John Guilfoyle, all of Brooklyn.

Henry Weyand, Waterbury, Conn., has the contract for the metal work on the new forge room at the plant of the Waterbury-Farrell Foundry & Machine Company, Waterbury, Conn.

The American Sheet Steel Company are at present adding 14 new Sheet mills to their various plants, mostly at Vandergrift, Pa. These mills will soon be in operation, and will greatly increase the company's output, especially of the heavier grades of Sheets.

It is reported that Col. George Wick has tendered his resignation as president of the Youngstown Iron Sheet & Tube Company of Youngstown, Ohio, and will sail for Europe shortly. Colonel Wick has been prominently identified with the number of the mills that are now owned by the United States Steel Corporation.

Barker & Biggart, Springfield, Mass., have the contract for putting up the Metal Ceiling in the buildings of Forbes & Wallace, in that city.

A labor-saving device for tin workers has recently been patented by Oscar Worthy and Charles Almas of Hamilton, Ontario, Canada. It is described as a combination of several of the tin working machines now in use, beaders, formers, groovers, crimpers, swadges, &c., making it possible to be used for one or more of the same without resetting. It is claimed that with it stove pipes can be completed, ready for seaming, at one passing through. One of its strong features is an attachment by means of which the action of the machine upon the material can be started or checked at will, as in the manufacturing of stove pipe it does not bend or crimp the edges of the material, thus allowing a straight edge for placing in the seamer.

The E. W. Bliss Company, Brooklyn, N. Y., are reported to have recently booked a large contract for Sheet Metal Working Machinery, which is intended to be installed in a plant now under construction in Buenos Ayres, Argentine Republic, for the manufacture of Enameled Ware.

The contract for the roofing and sheet metal work on the new smelting shop of the Ajax Metal Company, to be built at Richmond street and Frankford avenue, Philadelphia, has been awarded to John Byrd of that city.

A company are being formed at Canton, Ohio, by interests allied with the Stark Rolling Mill Company and the Carnahan Tin Plate & Steel Company for the purpose of erecting an open hearth plant to supply the Canton field. The plans call for three open hearth furnaces of 40 tons capacity each, provisions being made to double the capacity in case the demands should require it. Victor Beautner of Pittsburgh is consulting engineer.

W. B. Leeds, formerly vice-president of the American Tin Plate Company, and now president of the Chicago, Rock Island & Pacific Railroad, was operated on for appendicitis last week.

A dispatch from Anderson, Ind., reports that the local management of the American Tin Plate Company has received notice that the usual shut down in the factories will be omitted this summer. Surplus stocks are very light, and there being an active demand it becomes necessary to continue in active operation.

The National Works of the American Tin Plate Company, at Monessen, Pa., are to be very much enlarged. This has been a 12-mill plant, but is now being increased to 24 mills, two of which are in operation, making a total of 14 in all that are running. The remainder of the new mills will be started as fast as they are finished. When the entire 24 mills have been started the National Works will be one of the largest plants owned by the American Tin Plate Company. This was the only plant owned by the American Tin Plate Company that was operated continuously last summer during the strike. With the loyal men at this works much assistance was given toward the starting of other plants before the strike was broken.

The Bostwick Steel Lath Company of Niles, Ohio, have decided not to move their plant to Warren, Ohio, as contemplated, but instead have bought a site of 8 acres on the Erie Railroad, near Niles. The concern will erect new buildings and greatly increase their output of steel lathing.

The Gateway City Steel Tank & Roofing Company, La Crosse, Wis., manufacturers of Galvanized Steel Tanks, Bathtubs, Pails, Roofing, Siding, &c., are installing a new plant, and though they have purchased most of the required machinery, they will shortly be in the market for a stamping machine for the manufacture of Ceiling, Corrugated Iron Siding, &c., and considerable other machinery, as well as a 10 horse-power motor, shafting, &c. They advise us that they would like to purchase, if possible, a Conductor Pipe and Eaves Trough Machine.

The Australian Government has made some changes in the tariff law. Among these is the reimposition of a duty of 15 shillings per ton on Plain and Corrugated Galvanized Iron. The Government's original proposal was a duty of 15 shillings per ton on Plain and 30 shillings on Corrugated, but it was then decided in committee to free list both. Now a 15 shillings duty goes on in the interests of the local industry.

The British Tin Plate Trade.

Our London correspondent reports as follows on the tin plate trade of the United Kingdom: The tin plate trade is still doing remarkably well, all the mills being fully occupied, and orders in hand are calculated to keep things going till the end of June. In some cases delivery cannot be expected until August. Buyers of tin plates are, however, at the moment fairly well stocked, and as long as the American market continues brisk they do not fear for the near future. At the same time there is a feeling over here of distrust in regard to the markets of the United States, which two or three nasty smashes on the New York Exchange do not tend to reassure.

Lyon, Conklin & Co.'s Catalogue.

Having recently added a new department to their business—that of manufacturing eave trough, conductor pipe, and stove and heater pipe—Lyon, Conklin & Co., Baltimore, Md., have issued a new catalogue, a neat publication of 28 pages, covering the goods named as well as other lines of roofing materials handled by the concern. The firm of Lyon, Conklin & Co. are well known to the roofing trade in the South, having been established in the city of Baltimore for upward of 40 years. In an introductory note to the present catalogue, the concern state that they have installed machinery of the latest design, with all modern improvements, to enable them to produce sheet iron eave trough and pipe in perfect forms and shapes. They call particular attention to the fact that their plain, round conductor pipe is perfectly round, having no flat side as is the case with many other makes. Among the goods illustrated and described in the catalogue are the L. C. & Co. patent roofing seamer, which is well known to the trade. This is followed by Monumental galvanized eave trough, with lap or slip joint and full round bead, Monumental galvanized round conductor pipe, made either corrugated or plain, also eave trough miters and end pieces. Other goods included in the catalogue, which are handled by the concern and constantly kept in stock, are adjustable elbows, flat crimped elbows and shoes, ridge roll, corrugated iron roofing and siding, black, galvanized and painted, and black and galvanized steel roofing furnished in rolls, each containing one square.

The latter portion of the catalogue is devoted to miscellaneous roofing supplies, including rain water cut offs, eave trough hangers, conductor hooks and fasteners, conductor strainers, roofing felt, roofing nails, metallic roofing paint and roofers' cement, extension ladders and the Sampson sectional ladder, also the Nash, Monarch and Globe ventilators. The last two pages are occupied by a list of some of the other goods made or handled by the concern, including aluminum-coated sheet metal stove and furnace pipe, galvanized and black sheet iron, zinc, wire solder, tinners' machines and tools, hot air registers and ventilators and tin and stove dealers' supplies generally. The company call special attention to their guaranteed brands of roofing plates and roofing tin in rolls which they carry in all grades.

Summer School for Artisans.

The Summer School for Apprentices and Artisans, conducted under the auspices of the College of Engineering of the University of Wisconsin, at Madison, Wis., opens its second annual session on June 30, to continue until August 8. This useful institution, the work of which was described in our columns a year ago, is designed primarily for the benefit of machinists, carpenters and sheet metal workers, engineers, shop foremen and superintendents, superintendents of water works, electric light plans, factories and large office and store buildings in cities and young men who wish to qualify themselves for such positions. For these employments a full four years' course of engineering is not needed; yet, to satisfy the present demands upon this class of workers, it is necessary for them to obtain considerable theoretical and practical knowledge not commonly taught in the schools. During the six weeks of the season of the summer school this knowledge is sought to be instilled into the pupils. The several departments of work in the school include courses in steam engineering, applied electricity, mechanical drawing, theory of construction and of transmission of power; and shop work, including bench and machine work in wood and iron, foundry work, practice with machine tools, forge work, tool making and pattern work.

As a supplement to the home instruction provided to students by the correspondence schools, a knowledge of practical work in the laboratory and shop can be acquired at the Summer School for Artisans, which will be particularly helpful. All of the shop and laboratory equipment and other advantages of the College of Engineering of the University of Wisconsin are placed at the disposal of the pupils of the summer school. The tuition fee for the term is $15, and board and lodging can be secured for $4 per week and upward. The school was started last summer as an experiment, and proved eminently successful. This school, it is explained, is not self supporting, as the fees received pay but a small portion of the expenses. The remainder is paid out of the general university funds. The attention of young men who would be benefited by the instruction provided at this valuable institution is called to the peculiar advantages offered by it, and they are invited to communicate with Prof. J. B. Johnson, Dean of the College of Engineering, Madison, Wis., for further information in regard to the school.

TRADE NOTES.

The Hoyt Metal Company, St. Louis, Mo., have been operating their Sheet Lead manufacturing department lately day and night, in order to keep up with the demands of their customers. The company's foundry has also been crowded with work and is considerably behind with its orders.

The Metile Construction Company is the title of a concern recently incorporated at Syracuse, N. Y., by John J. Cummins, Edward K. Butler and certain New York capitalists, to manufacture a material known as Metile, and designed to be used as a substitute for tiling and marble. The composition is said to be the discovery of a German chemist and it is now being manufactured largely in Germany. The American rights have been secured and the company will erect a factory for the production of this material in Philadelphia.

The Foundrymen's Association have filed an application for a charter in Reading, Pa. The object of the association, as stated in the application, is to "encourage and protect the interests of foundry operators, promote harmony and encourage uniform customs among foundrymen." The Board of Trustees, who will manage the affairs of the association, consists of Peter D. Wanner, Charles S. Prizer and John E. Harbster of Reading. The other incorporators are Howard Evans, Josiah Thompson, Antonio C. Pessano, Thomas I. Rankin, W. P. Brown, Alfred L. Belfield, Thomas Devlin and Oregon J. Ward, all of Philadelphia; Richard C. Oliphant, Trenton, N. J.; James J. Stirling, Washington, D. C., and T. B. Harkins, Bristol.

The Markle Lead Works have sent out a notice to the effect that all mail intended for them should be addressed to 718-720 Rialto Building, St. Louis, Mo. The company's general headquarters are at Granite City, Ill., where their factory is located.

The Baltimore Rolling Mill Company have purchased a large piece of land in the eastern limits of the city of Baltimore, Md., and will erect thereon a mill for the production of Bar Iron and other finished products. The officials of the company are: Harry Wehr, president; Charles G. Phillips, vice-president, and J. W. Bonley, secretary. Mr. Wehr is a member of the firm of H. Wehr & Co. of Baltimore, dealers in iron and steel, and Mr. Phillips has been connected for a number of years with the Diamond State Steel Company of Wilmington, Del. The property purchased by the company is favorably located near the water front and will possess exceptional facilities for the receipt and shipment of the raw material and finished products.

The Cardiff-Peachbottom Slate Mfg. Company of Cardiff, Md., have been incorporated with a capital stock of $25,000, by Nelson A. Heap, William D. Waltz, Griffith Griffiths, John Parry and others, for the development of Slate quarries and to manufacture Roofing Slates.

We are advised by the Pittsburgh Reduction Company that they will erect a new plant at Massena, N. Y. It has not been fully determined just what size the initial plant will be, but it will ultimately be of sufficient capacity to utilize 50,000 electrical horse-power. Plans are now being prepared. It is also intended to ultimately erect a building for turning out finished articles made of Aluminum. The power for the plant is to be supplied by the St. Lawrence Power Company, who have just finished their mammoth hydraulic electric plant at Massena.

The Northwestern Metal Company, Milwaukee, have been organized with a capital stock of $2500. The incorporators are Peter Cassel, J. P. Cassel, Jr., and John B. Wendell.

The Energy Elevator Company, Philadelphia, Pa., who were established in 1887, have been incorporated with a capital stock of $25,000. The officers of the new company are: John A. Currie, president; Samuel H. Garrett, secretary, and Adolph G. Wuest, treasurer. The manufacture of Elevators, Dumb Waiters and Hoists will be continued.

The I-XL & Goshen Pump Company, Goshen, Ind., manufacturers of Window Screens and Screen Doors, Wood and Chain Pumps, Kitchen Furniture, Ladders, Lawn Swings, &c., have just broken ground for a new brick finishing room, 48 x 222 feet, two stories and basement. They expect the building completed by August 1.

The D. M. Steward Mfg. Company, Chattanooga, Tenn., state that they are crowded with orders for their Metal Workers' Crayons and Slate Pencils, more particularly from foreign countries and especially England, France and Australia. Among large contracts they have entered into is one to supply the London, England, city schools with pencils. Export business in their other lines, including Lava Electric Insulators, Gas Burners for acetylene and coal gas, is growing rapidly. The company are putting on the market a new preparation, called Stainoff, for removing machinery paints and oils from the hands.

It is announced on good authority that the New Jersey Zinc Company have purchased the Prime Western Spelter Company and the plant of A. B. Cockerell, both at Iola, Kan.

The Allentown Hardware Mfg. Company, Allentown, Pa., have recently purchased the Allentown Brass Foundry, the Allentown Nickel & Brass Works and the Standard Electro Plating Works of that city. They are putting on the market Refrigerator Hardware, Bar Rails, Cash Register Parts, Door Pulls, Door Sills and Machine Plates. They are also in a position to do both light and heavy brass, bronze and aluminum casting, as well as brass, copper and nickel plating and finishing.

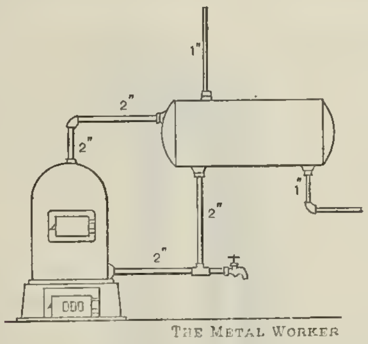
THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

IS TANK HEATER CONNECTED CORRECTLY?

From C. M. J., New York City.—Having read the letter of "R. M. D." in *The Metal Worker* of May 24, I would say that the method of piping shown in the accompanying sketch overcomes some objections that might arise to the connection shown in his sketch. In my sketch there is nothing to impede the circulation, while in his sketch the hottest water might pass up the 1-inch hot service pipe and support a more or less active circulation in that pipe without circulating through the storage tank, as desired. The connection which he shows would become air bound if it was not for the 1-inch hot service being taken from the top of it. My sketch shows the flow pipe from the tank heater connected near the top of the tank and on the end. This will allow a supply of hot water to be drawn shortly after the fire is lighted, while, if it connected at the center of the tank, a much longer time would expire before hot water could be drawn. One of the advantages of the connection shown by "R. M. D." is that hot water could be drawn very soon after the fire was lit.



Is Tank Heater Connected Correctly?

HIGHT AND CAPACITY OF TANKS.

From P. J. L., Milwaukee, Wis.—Please be kind enough to give the shortest and best rule to figure out the amount in gallons a tank of a given hight and diameter will hold. Also for obtaining the hight that a tank must have to hold a given number of gallons when the diameter is given. For example, if a tank is 16 inches in diameter how high should it be made to hold 20 gallons? How many cubic inches are there in a gallon?

Answer.—In a United States gallon there are 231 cubic inches. To find the hight of the tank given in the example, divide the 20 gallons by the decimal fraction 0.0034 and divide the quotient by 16 and again by 16, when the quotient will be 23, the hight in inches which the tank must have as per example: $20 \div 0.0034 = 5882 \div 16 = 367 \div 16 = 23$ inches; hight of tank.

Another method is to multiply the 20 gallons by 231 and divide the product by 201, the area of a 16-inch circle, and the quotient will be 23 inches, the hight the tank must be, as per example: $231 \times 20 = 4620 \div 201 = 23$ inches, hight of tank. This method of figuring is a reversal of the short rule for finding the number of gallons a tank of given dimensions will hold, which is to square the diameter and multiply by the hight and then by 0.0034, as per example: $16 \times 16 = 256 \times 23 = 5888 \times 0.0034 = 20$ gallons. The decimal fraction 0.0034 is obtained by dividing 0.7854 by 231, the number of cubic inches in a gallon. If 0.0034 was not used the process would be $16 \times 16 = 256 \times 0.7854 = 201$. Then $20 \times 231 = 4620 \div 201 = 23$ inches. Or, $201 \times 23 = 4623 \div 231 = 20$ gallons.

FORMULAS FOR GAUGE OF METAL ON GALVANIZED STEEL TANKS.

From D. C., Gainesville, Texas.—I build steel tanks and am bothered to know how large a tank I can build out of a certain heft of galvanized steel. For instance, I desire to know the very largest tank for water that can be built of No. 16 gauge steel and be perfectly safe; also of any other gauge of steel. This information I greatly need and cannot get it here. Any assistance you can give will be highly appreciated.

Answer.—In *The Metal Worker* of May 17 was presented some information that bears on this subject. In addition, we reprint the following from *The Metal Worker* of October 12, 1901: There are no direct formulas for thickness of iron for tanks. The conditions in regard to pressure are variable with the requirement for wear and the methods of riveting, and also the added strength due to galvanizing on the seams. As a general rule, a factor of safety of six times the strength of the longitudinal seam should be allowed, and for riveted and galvanized seams a factor of safety of four times the strength of the iron should be allowed. Then, as galvanized plate iron is equal to a breaking strain of about 40,000 pounds per square inch, its factor of safety will be 10,000 pounds. For cylindrical tanks to be limited to 100 pounds pressure and 16 inch diameter, we have one-half the diameter for the multiplier of the pressure, or $100 \times 8 = \frac{800}{10{,}000} = 0.08$ inch, or No. 12 by the American gauge. Hot water tanks of the trade are made somewhat thicker than this for convenience of making connections and for wear. Books on boiler making give the method for computing strains and the bracing for other forms, which should be the same for tanks.

ROOFING OVER OLD ROOFS.

From B. McK., Augusta, Ky.—Replying to the inquiry of "G. A. H.," I would say, from my experience, covering 15 years in metal roofing, as regards the laying of roofing over old roofs, and as to which is the better, "to tear off the old shingles" or "cover over them," that these questions must be determined by the good judgment of the roofer after an examination of the old roof and consideration of the style of roofing to be put on. If, on examination, the shingles are found to lay flat, smooth and close to the sheathing, and the style of roofing to be put on is V crimped, I should decide very quickly to lay the new roof over the old, using eight-penny wire nails, and driving them straight down through the center of the crimp, making sure that they will enter the sheathing boards. The advantage thus gained to the roofer is the saving of time and labor; to the owner of the house, or occupant, a relief from the heat and noise and to the roof itself, of having a solid underlying surface. In my opinion such a roof will last longer, give better satisfaction and call for less attention than any other manner of application. But should the old shingles be found curled up on the ends, loose and presenting a rough and uneven surface and the style of roofing be any other than the V crimped, I would not be long in deciding that the shingles should be taken off, all nails pounded down, new sheathing put in where needed and good heavy felt paper laid under the new roof. This is always a reliable mode of application. But, answering the question of which is the better plan, I do not hesitate to say that, with proper judgment and care taken, I pin my faith to the first manner of application—that of covering over the old roof.

GUARANTEE SHOULD NOT BE GIVEN.

From A. J., New York.—I should be pleased if you would present the following item in the Letter Box, for the purpose of securing the opinion of the roofing craft concerning it: I recently repaired the leader box and also the worst spots on a tin roof, but told the agent of the building to put on tar and paper, as a further means of making the roof tight, as some of the seams of the roof were leaking. He wanted to economize and told me to fix the roof the best way I could without tar. The whole job, with repairs and two coats of paint, amounted to $23. After having the bill a few weeks in his hands, the agent wrote me that he will pay it provided I give him a year's guarantee.

BATH FOR DIPPING BRASS.

From A. B. F., Brooklyn.—Will you please describe in *The Metal Worker* the bath used for dipping brass and the proportions required?

Answer.—A variety of baths are used for dipping brass, and it depends on the color or finish desired as to which is the best. That most frequently used is composed of sulphuric acid and water, in the proportion of 1 part of the acid to 15 or 20 parts of water; or hydrochloric acid may be substituted for the sulphuric acid. If the articles are to have a bright finish they are first dipped in the diluted sulphuric acid to remove the tarnish, then into a mixture composed of 100 parts, by weight, of nitric acid; 50 parts of sulphuric acid, 1 part of soot and 1 part of common salt. As soon as the articles show a bright appearance they are quickly rinsed in a large quantity of water that must be frequently changed. After washing with the cold water, they should again be rinsed in hot water so that they will dry quickly. Several recipes for these baths are given in "The Metal Worker Handy Book," which can be supplied by our Book Department.

PROTECTION FROM BREATHING ACID FUMES.

From Y. Z., Bridgeton, N. J.--I have noticed the inquiry of "X." in *The Metal Worker* of May 17, and would suggest that if he wears a fine sponge that has been dampened under his nose he will escape much of the annoyance that arises from soldering with strong acids.

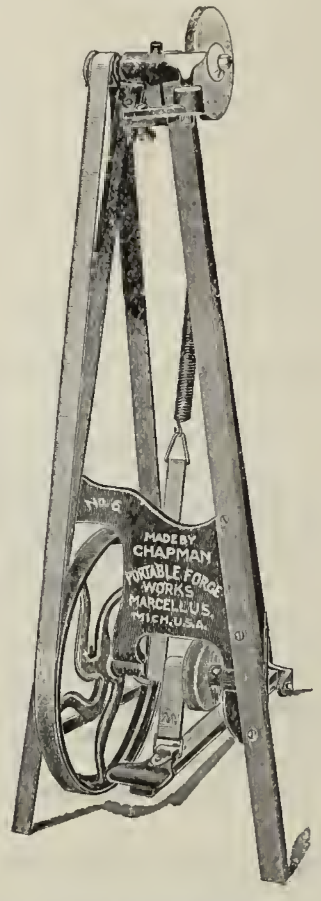
Exhibit of Alcohol Appliances in Peru.

United States Vice-Consul J. C. Cree of Callao, Peru, reports that an international exposition of the appliances of alcohol will be held in Lima, Peru, from November 1 to 30 of this year. The exposition will include appliances wherein alcohol is used for motive power, heating apparatus, lighting and other purposes. Prizes will be awarded, consisting of gold, silver and copper medals. Space for exhibits will be given free, as well as the necessary lighting and water, and the committee in charge will, when requested, attend to the installation of exhibits free of expense. In order to insure the admission of the exhibits, obtain concessions, reduction in freight rates, &c., communications should be addressed to the secretary of the executive committee, containing the name and address of the exhibitor, the nature and use of the articles to be exhibited, and the superficial area in meters required. Exhibits must be entered, at the latest, before the end of September. In the division of heating apparatus using alcohol are placed heaters for general use, railway cars, coaches, calefactors, stoves and other apparatus; in the division of lighting; lamps or apparatus of the incandescent system for public use operated by means of methylated or neutralized alcohol; lamps using carburized alcohol, and lamps or apparatus of the incandescent system for domestic use. All utensils and apparatus making use of neutralized, methylated, carburized or solidified alcohol will be subjects for exhibits. Foreign exhibits are particularly solicited.

According to the *Journal of the Franklin Institute* an artesian well in Grenelle, France, took ten years of continuous work before water was struck at a depth of 1780 feet. At 1259 feet over 200 feet of the boring rod broke and fell into the well, and it was 15 months before it was recovered. A flow of 900,000 gallons per day is obtained from it, the bore being 8 inches. At Passy, France, there is another artesian well 1913 feet in depth and 27½ inches in diameter, which discharges an uninterrupted supply of 5,500,000 gallons per day; it cost $200,000. An artesian well at Butte-aux-Cailles, France, is 2900 feet in depth and 47 inches diameter. These are all surpassed by an artesian well in Australia, which is 5000 feet in depth.

Chapman's Grinding Machine No. 6.

The Chapman Portable Forge Works, Marcellus, Mich., are putting on the market the grinder herewith illustrated. The point is made that it stands alone, not having to be bolted to the wall or floor. The floor space occupied is 18 x 22 inches; the hight from the floor to the center of the spindles 41½ inches; weight 67 pounds, with one emery wheel, ¾ x 6 inches. The two front uprights are angle steel, the back upright channel steel and the side braces band steel. The front brace, or name plate, is of cast iron, well ribbed, with large babbitted bearings for the main shaft, which carries the cluch and fly wheel. The treadle rod is of hard wood, attached to the back upright by a hinge, and has a cast iron treadle plate, to which is attached the strap for driving the clutch. The coiled spring, also attached to the rear upright and to the clutch by a second strap, rewinds the clutch and raises the treadle. The top end of the uprights is bolted to a solid cast iron head piece which has a projection on the front, to which the tool rest socket is attached by means of a bolt and wing nut. The spindle runs in a two-part adjustable babbitted bearing 4½ inches long, which is bolted to the head casting in such a manner that it can be easily adjusted to line with the fly wheel, so that the belt will run properly. The head bearing has an oil hole, which is covered with a brass cap to keep out dust. The fly wheel is large enough, it is stated, to give 2000 revolutions per minute as an easy motion, while double that speed may be attained. It is explained that the machine will grind and polish machine parts of steel, wrought and cast iron or brass; that it will sharpen plane bits, chisels, drills, cold chisels, knives, shears, skates, &c., and that the grinder is especially adapted to carriage makers, blacksmith and bicycle repair shops and marble and granite cutters, as well as many uses in connection with mills, mines, farms and ranches.



Chapman's Grinding Machine No. 6.

The Oshawa Steam & Gas Fitting Company have been incorporated, at Oshawa, Ontario, with a capital of $50,000, by W. F. Cowan, J. D. Storie and H. T. Earswell.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is quiet and a shade higher.

Copper has fluctuated, but remains at about former price; demand is quiet.

Pig Lead is quiet and firm.

Spelter is scarce and considerably higher.

Antimony is unchanged.

Nickel is in good demand, and without change in price.

Aluminum is firm and in good demand.

Tin Plates are quiet, with prices unchanged.

Black Sheets are firm; demand is rather lighter.

Galvanized Sheets are not in such heavy demand, but are firm.

Old Metals are rather quiet but without change.

Foundry Iron is becoming still more scarce, with prices mounting upward.

Sheet Copper is in good demand, with prices firm.

Sheet Zinc is without change.

Hardware is moving in good volume and prices remain strong.

Plumbers' Supplies are in good demand, with prices in general strong.

Plumbers' Earthen Ware is likely to advance.

Wrought Iron Pipe prices in New York have been readjusted.

Bare Copper Wire prices are somewhat irregular, owing to break up of the association.

Raw Washers are higher in price and strong.

Wire Cloth is scarce and very firm.

Garden Goods are in heavy demand and prices firm.

Oil and Gas Stoves are moving freely at strong prices.

Wire Nails are active and firm.

Cut Nails are in good demand with prices unchanged.

Window Glass is dull and no higher in price.

Linseed Oil is firm and unchanged.

Spirits Turpentine has advanced about ¼c. per gallon.

METAL MARKET.

New York, May 31, 1902.

Pig Tin.—A quiet market prevailed here throughout the entire week. The fluctuations were very slight, and values held about the same position as a week ago. Business has been on a very moderate scale. At the close the market was firm, retail prices ruling from ⅛c. to ¼c. higher than those given in our last report. Straits Pig in small lots is quoted at 31¼c. to 32c. per lb., according to quantity. Arrivals thus far this month have been rather light, amounting to about 2647 tons.

Copper.—The manipulation of this metal continues in the hands of the interests concerned in the flotation of the new company, as referred to in our report last week. Early in the week the market advanced materially, but a reaction took place on Wednesday bringing renewed weakness and lower prices. The consumptive demand also slackened with the weakening tendency on prices. Jobbers' prices remain at about the level of a week ago—viz., 13c. to 13¼c. per lb. for Lake Ingot in small lots, and 12¾c. to 13c. for Casting Copper. Exports during the week were somewhat better than expected, bringing the total for the month thus far up to 1300 tons.

Sheet Copper.—The demand for Sheet Copper continues active, and prices remain firm on the basis of 18c. per lb. for Sheet Copper from store.

Pig Lead.—The market for Pig Lead is without change. Demand is moderate, and prices remain steady at the figures ruling for some time past. American Pig in small lots is quoted at 4.45c. to 4½c. per lb. St. Louis advices report conditions in Pig Lead at that center to remain very much as they have been, a very light run of transactions having marked the week under review.

Spelter.—Scarcity of spot metal is the leading feature of the market for Spelter. This fact has imparted great stiffness to prices which have advanced sharply during the week, ruling about ½c. higher than those of a week ago. Good Western brands in small lots are now quoted at about 5¼c. to 5½c. per lb. The demand is of fair proportions, but consumers this week appear to have been discouraged in purchasing by the sharp advance in the metal. St. Louis advices report that labor troubles have seriously hampered smelting plants, and have practically brought the activity in the market for Spelter to a halt. No general buying is noted, and what few sales are being made are for urgent requirements, a considerable premium being exacted. Owing to the short supply satisfactory quotations are hard to arrive at.

Sheet Zinc.—The demand for Sheet Zinc is of the usual proportions and prices are firmly maintained at 6¼c. per lb. for 600-lb. cask lots and 6¾c. to 7c. for smaller quantities.

Antimony—Is unchanged. Hallett's in small parcels is quoted at 8⅝c. to 8¾c. per lb.; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—There is no change in the market for this metal. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues active, and prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—There is nothing new or interesting to be recorded in this department. The demand is of very moderate proportions and prices remain unchanged and firm. American Bessemer Coke Plates, I C, 14 x 20, in moderate sized lots, delivered at New York and corresponding points, are quoted at about $4.75 to $4.90 per box. Deliveries on former contracts continue on a liberal scale.

Sheets.—The demand for Sheets is not as active as it was some time ago, but mills are pretty comfortably filled with orders for the next three months. It is understood that two or three of the mills of the American Sheet Steel Company will be closed soon for extensive repairs and improvements. Meanwhile, the mills are making full time and are succeeding in getting more nearly abreast of their contracts, which will enable them to better cope with the rush of business that is expected later on. Galvanized Sheets are relatively rather quiet, but the mills making this class of material are pretty well filled up on old contracts. Jobbers' prices remain firm and without change. No. 27. One Pass, Cold Rolled Soft Steel Sheets are selling at about 3.75c. to 3.80c., and No. 24, Galvanized, at 4c. to 4.20c.

Chicago advices are as follows: There has continued to be considerable animation, and the market has remained firm with full prices. Small lots of No. 27 Black Sheets from store are quoted at 3.45c. to 3.55c. Galvanized Sheets are quoted at net prices, small lots from store being held at 4.70c. to 4.75c. for No. 27.

Old Metals.—The demand for Old Metals of all kinds is fair and prices remain pretty steady. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10¼c.
Light and Tinned Copper	per lb. 9¼c.
Heavy Brass	per lb. 8¼c.
Light Brass	per lb. 6½c.
Lead	per lb. 3⅝c.
Tea Lead	per lb. 3¼c.
Zinc	per lb. 2⅞c.
Pure Aluminum Sheet	per lb. 22 c.
Cast Aluminum	per lb. 17 c.
No. 1 Pewter	per lb. 18 c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$13.00 to 13.50
Heavy Cast Scrap, per gross ton	12.00 to 12.50
Stove Plate Scrap, per gross ton	8.50 to 9.00
Burnt Iron, per gross ton	7.00 to 7.25

THE PIG IRON MARKET.

New York.—A sharp demand exists for prompt delivery, because of delayed shipments from furnaces whose output has been cut down by the scarcity of fuel owing to the miners' strike. Practically nothing is available for such delivery, and therefore in spite of an active inquiry the market is quiet. Consumers are not placing orders to any extent for delivery late in the year, as they are hopeful that when they need Iron they will be able to secure it from Southern furnaces if not from Northern makers. Considerable Iron can be obtained from Southern furnace companies for delivery during the last quarter of the year. Prices are very firm, with an upward tendency, because of the sharp demand for early delivery. Quotations for summer delivery are as follows: Northern Iron, at tidewater, No. 1 X, $21.50 to $22; No. 2 X, $20.50 to $20.65; No. 2 Plain, $20 to $20.65. Tennessee and Alabama brands are quoted as follows: No. 1 Foundry, $20.50 to $21; No. 2 Foundry, $19.25 to $19.75; No. 3 Foundry, $18.25 to $18.50.

Chicago.—Stove foundries, Pipe works, machine shops, special foundries and general merchant foundries have been among the buyers in the local Pig Iron market during the week. The character of the trade has changed but little. It is well known that the principal large consumers have pretty well covered their wants for the balance of the current year, but in exceptional instances larger melters have only partially provided for their needs. Others who have ample Iron bought suddenly find themselves forced into the market to meet unexpected emergencies. The bulk of the business has been in small amounts ranging from one car to 500 tons. Prices of Northern Iron are without essential change—that is, for long delivery—but the Iron available for prompt shipment continues to command considerable premium. At the close Southern Iron is being held at 50c. to $1 per ton higher than the prices current a week ago, sales having been made early in the week on the basis of $16, Birmingham, for No. 2 Foundry, but subsequently contracts were booked at $16.50, and at close $17 is generally asked, while moderate amounts for immediate shipment have been sold on the basis of $17.50 to $18 for No. 2 Foundry, Birmingham. We quote as follows:

Lake Superior Charcoal	$23.00 to $24.00
Local Coke Foundry, No. 1	22.00 to 22.50
Local Coke Foundry, No. 2	21.00 to 21.50
Local Coke Foundry, No. 3	20.50 to 21.00
Local Scotch, No. 1	22.00 to 23.00
Ohio Strong Softeners, No. 1	24.00 to 24.50
Southern Silvery, according to Silicon	20.40 to 20.90
Southern Coke, No. 1	20.65 to 21.15
Southern Coke, No. 2	19.65 to 20.65
Southern Coke, No. 3	19.15 to 19.65
Southern Coke, No. 1 Soft	20.65 to 21.15
Southern Coke, No. 2 Soft	19.65 to 20.65

Philadelphia.—Iron is getting scarcer, and in view of the strike in the Anthracite Coal regions and the extreme difficulty in securing Coke, it is hard to find any satisfactory reason for expecting easier conditions in the near future. Some of the local furnaces will probably have to be banked for want of fuel. With so many uncertainties surrounding the situation it would be useless to attempt any forecast in regard to the future, as everything depends upon influences which are as yet in embryo. The most trustworthy sources of supply, however, during the next few weeks will probably prove to be in foreign markets, prices there being about on a parity with our own, freight and duty paid. American brands for delivery during the last four months of the year are about as follows, with earlier deliveries at anywhere from $1 to $1.50 more money:

No. 1 X Foundry	$20.50 to $21.50
No. 2 X Foundry	19.75 to 20.50
No. 2 Plain	19.50 to 20.00

Pittsburgh.—Report has it that the United States Steel Corporation are negotiating for the purchase of 100,000 tons of Bessemer Iron for next year's delivery. If this deal goes through it is claimed that practically the surplus output of Pig Iron in the two Valleys will be under contract up to April of next year. It is not a question of price in the Pig Iron market any longer, but where to get the Iron. No. 2 Foundry brings $20.50 to $21 and higher in this market.

Cincinnati.—The last week developed quite a little trade in Southern Pig Iron. Buyers who had been holding off for various reasons and making effort to bear the market or have selling conditions modified appear to have given up their contentions and cleaned up nearly all the offerings in sight. Once again it is being said that there is no more Pig Iron to offer for delivery prior to next October. And for the last quarter, too, there seems to be a general opinion that the available unsold supply will prove to be a scanty one. The generally accepted price for forward delivery is still on the basis of $16, Birmingham, for No. 2 Foundry. For prompt shipment, usually in small lots, the standard varies up to $17, same basis. Generally speaking, the market is unchanged, with the surface indications rather in favor of those who prophesy a very still price-list next fall. We quote, f.o.b. Cincinnati, as follows:

Southern Coke, No. 1	$19.25 to $19.75
Southern Coke, No. 2	18.75 to 19.25
Southern Coke, No. 3	18.25 to 18.75
Southern Coke, No. 4	17.75 to 18.75
Southern Coke, No. 1 Soft	19.25 to 19.75
Southern Coke, No. 2 Soft	18.75 to 19.25
Ohio Silvery, No. 1	21.85 to 22.35
Ohio Silvery, No. 2	21.35 to 21.85
Lake Superior Coke, No. 1	22.35 to 23.10
Lake Superior Coke, No. 2	21.85 to 22.35
Lake Superior Coke, No. 3	21.35 to 21.85

St. Louis.—Little variation is to be noticed in the condition governing the Pig Iron situation at this point, and while sales are not running in heavy volume, yet considerable inquiry and demand for the last half is in evidence. The major part of the orders are now being executed on a basis of $16, Birmingham, for No. 2 Foundry, but we do hear of some sales at a 25c. and 50c. higher rate. However, these sales are hardly of sufficient importance and volume to be of much influence on the mind of the buyer. The following is a range of prices current for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$20.00 to $20.25
Southern, No. 2 Foundry	19.25 to 19.50
Southern, No. 3 Foundry	18.75 to 19.00
Southern, No. 4 Foundry	18.25 to 18.50
No. 1 Soft	19.75 to 20.00
No. 2 Soft	19.25 to 19.50

THE HARDWARE TRADE.

With the closing days of the month the trade, while continuing in large volume, is feeling the effect of the near approach of the summer. The influence of the changing season is observed not only in the somewhat diminished activity, but in the different classes of goods called for, as summer goods are in especial demand. Manufacturers with few exceptions are busy on orders and most of them are subjected to urgent requests from merchants for prompt shipments. The jobbing trade very generally report an active business, as goods sell readily in fair but not often in speculative quantities. Season goods are generally in limited supply, and there is more or less scarcity in several lines. Manufacturers of many staple goods in both Shelf and Heavy Hardware are seriously behind their orders as a result of the almost unprecedented activity of the past few months. Since the abandonment of the consolidation scheme the houses who contemplated such giving up of their identity, and consequently were not so aggressive as usual in entering the market, have been placing orders, and their business makes a perceptible addition to the current volume. There is a disposition on the part of the lareg trade to place orders for fall requirements at an early date, apprehending that if nothing occurs to disturb the present activity it may be a difficult matter to get goods as promptly as the trade will require. Enterprising jobbers, and this term describes practically all the houses who have an important position in the market, recognize the obligation to have well assorted stocks from which their customers can draw, even if in order to secure them it be necessary to order an unusual length of time in advance. In the present state of the market the difficulty the manufacturers experience in getting raw material, together with the heavy demand for their products, makes it necessary for the larger trade to anticipate their wants more liberally than has been the case even during the years of exceptional prosperity which have characterized the trade of late. In connection with this great demand there is an earnest effort on the part of manufacturers to meet the requirements of their customers, and the factories are generally running to full capacity and in many instances are being furnished with increased facilities.

NOTES ON PRICES.

Wrought Iron Pipe.—Some jobbers in the Metropolitan district held a meeting on Tuesday afternoon, at which prices to cover sales from stock in Greater New York, Long Island and for the export trade were adopted. The new prices are as follows:

	Discount.
1/8 to 1/2 inch Black Pipe	58 %
3/4 to 12 inch Black Pipe	65 %
1/8 to 1/2 inch Galvanized Pipe	46 %
3/4 to 12 inch Galvanized Pipe	53 %
Extra Heavy Pipe, Plain Ends, Black, all sizes	50 %
Extra Heavy Pipe, Plain Ends, Galvanized, all sizes	40 %
Double Extra Heavy Pipe, Black and Galvanized, all sizes	20 %

It will be noted, in comparing these prices with the last manufacturers' quotations, that the jobbers are much more liberal in their discounts on the smaller sizes than they were a week ago. This is owing to the fact that the jobbers now have an excessive stock of the smaller sizes on hand. Greater scarcity is found in the sizes running from 3/4 to 2 inches, inclusive, and while prices quoted are a fair index of the market, still some of the jobbers are insisting upon their customers paying an extra 5 per cent. beyond these prices.

Sanitary Earthen Ware.—It is understood in the Earthen Ware trade that a recasting of the lists now in effect is under way, and that new list prices showing a higher level will soon be adopted. This, we understand, is due to the fact that the operating potters are getting from 10 to 20 per cent. more wages than they were a year ago, and it is to meet the new conditions that the manufacturing potters decided to change the list, rather than make any change in the discounts. It is likely that the new list will be adopted in the very near future.

Copper Wire.—The association of manufacturers producing bare Copper Wire for numerous purposes discontinued their organization Wednesday, May 21, after years of association, and adjourned *sine die*, with, it is thought, little probability of getting together again, at least in the near future, leaving the market an open one on this class of Wire. This action was brought about by the creeping in of new competition by outside concerns, assisted by some internal friction in the association. The price is now 13½ to 14 cents per pound. The Insulated Wire Association, making Weather Proof and Magnet Copper Wires, held a meeting Tuesday, May 27, and made approximately a reduction in price of ½ cent per pound. On Weather Proof the base is now 14½ cents. On the Magnet Wire, the reduction is ½ cent per pound from the net list.

Washers.—Several advances have of late been made in the prices of Raw Washers and the market has a decidedly firm tone. In the quotations of the manufacturers a differential of 20 cents per 100 pounds is made between the price to jobbers and retailers, and for less than keg lots of a size the following extras are regularly added:

Packages of 100 up to 200 pounds, 10 cents per 100 pounds. additional.
Packages of less than 100 pounds, 50 cents per 100 pounds additional.
Packing in 5 and 10 pound packages, ½ cent per pound net.
Packing in 1-pound packages, 1 cent per pound net.

Wire Cloth.—The scarcity in Wire Cloth to which we have before referred still continues and jobbers find it difficult to meet the requirements of their customers. Under these conditions the market is decidedly firm, and those having stocks of the goods are able to realize good profits.

Garden Goods.—The volume of business in Garden Goods, such as Lawn Mowers, Hose, Garden Tools, &c., is exceptionally heavy and considerably in excess of last year. So urgent is the call, especially for Lawn Mowers, that manufacturers are scarcely able to meet it. Prices are very firmly maintained.

Summer Goods.—The demand for seasonable goods, such as Oil and Gas Stoves, Screen Doors and Window Screens, Ice Cream Freezers, &c., is very heavy, and prices in all these lines are strong.

Wire Nails.—The local demand for Wire Nails is satisfactory, with prices well maintained. Stocks are now kept well assorted, owing to the more prompt shipments made by mills. Prices are firm. Small lots from store are quoted at $2.30 per keg.

Cut Nails.—Some improvement is noticed in shipments of Cut Nails from mill, as they are now being made more promptly. There is a moderately active demand for Cut Nails in the local market. Quotations for small lots from store are unchanged at $2.30 per keg.

Window Glass.—No change in prices was made at the meeting of the National Window Glass Jobbers' Association, held in Chicago last week, according to information received. The demand is slack, owing to the unsettled conditions of labor. Glass from store, single and double strength, is quoted at 89 per cent. discount.

Linseed Oil.—The market for Linseed Oil is firm at former prices, no advance having been made. Crushers are reported to be well sold ahead. A fair jobbing demand is noted from this and nearby points. City Raw in small lots is quoted at 67 to 67½ cents per gallon.

Spirits Turpentine.—The demand for small lots of Turpentine is light at this point. The market is firmer owing to stronger feeling at the South. Consumers here seem to have covered their wants for the near future, and are waiting for a more favorable market before purchasing. Turpentine in retail quantities is quoted at 48¼ to 48¾ cents per gallon.

American Seal Paints and Cements.

The William Connors Paint Mfg. Company, the well-known makers of American seal paints, cements, &c., Troy, N. Y., have issued some rather interesting trade literature, calling attention to their specialties. Among this is a blotting pad consisting of several sheets of variously colored paper fastened to a celluloid top or cover, carrying the name and address of the company, together with a general view of their factory and an enumeration of the specialties which they are prepared to supply. Another novelty is a cardboard match safe, embellished with a picture of a workman mixing mortar and carrying in the receptacle for matches a paper representation of a barrel which, upon lifting out, is found to have attached to it a circular setting forth the merits of the American seal mortar colors. The company state that, having recognized the need of mortar colors which should mix evenly and possess excellent lasting qualities, they have devoted much time, study and application to experimentation and the production of colors, the ingredients of which would so combine as to cause them to meet the requirements named. These mortar colors are referred to as being indorsed by leading architects and painters, and the claim is made that they are compounded from such ingredients as to render them proof against the roughest element in any climate. A series of cards which the company are distributing are designed to call attention in a unique way to the merits of the paints and cements which they manufacture. Copies of these advertising novelties will be forwarded on application to those interested in goods of this character.

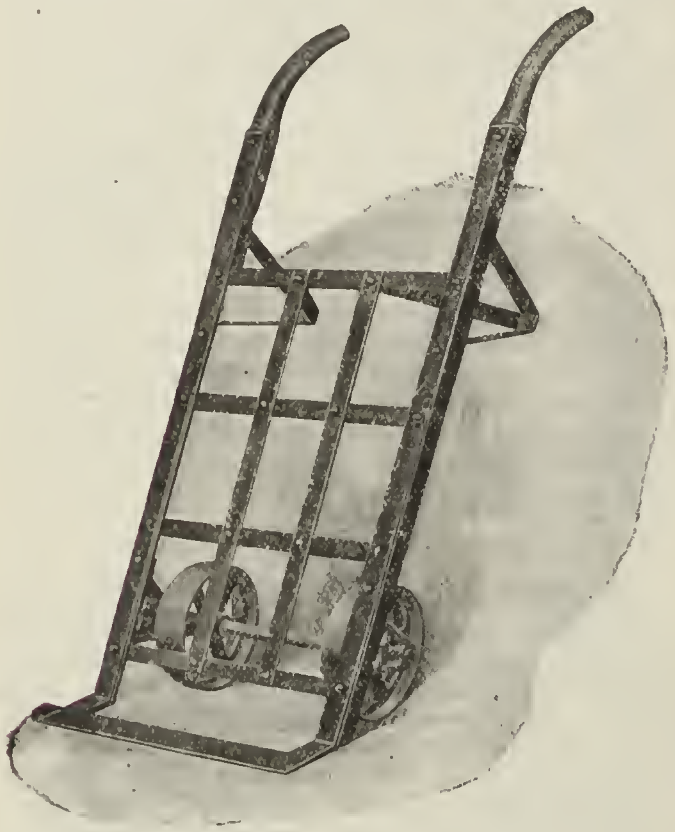
Elimination of Impurities from Brass Scrap.

The Ajax Metal Company, Philadelphia, Pa., advise us that they have, after considerable experimenting under the direction of G. H. Clamer, perfected a method for the elimination of zinc, iron, manganese, aluminum and other impurities from brass scrap, making the metal practically pure, and for which Mr. Clamer has been granted patents. They propose to erect a building, 100 x 175 feet, for the purpose of refining metal under these patents, and say that they will then be able to work ores direct from the mines, copper matte and galena. It is expected that the additional plant, for which ground adjoining their present plant has been acquired, will be erected and in operation by September next.

◆

Hercules All Steel Truck.

The accompanying cut represents a line of all steel trucks offered by the Columbus Skein & Iron Works, Columbus, Ohio. The trucks are designed for railway, steamship and general warehouse purposes to replace the ordinary wooden trucks for heavy duty where the latter fail. The weight of the trucks illustrated is said to be but a trifle in excess of iron protected wooden trucks of ordinary design, and the price to the trade approximately the same. The materials used in the steel trucks are referred to as being the best, and being almost entirely of steel construction, except the hickory handle grips, are designed to withstand rough usage. The sides and cross bars are of angle steel to combine lightness with strength; the axles, dash and center straps are of steel also, the whole being riveted together to make the trucks light, strong and practically indestructible. The handles or grips, being bolted securely to the side rails, can be removed in case of accident, and replaced at a trifling cost. In addition to the style shown in the cut, of which five sizes are made, cotton and barrel trucks are manufactured.



Hercules All Steel Truck.

◆

A New Building Material.

"Polished Architectural Cork" is the title of a daintily printed pamphlet which is being sent out by the Nonpareil Cork Mfg. Company, Bridgeport, Conn. This material is made in blocks or sheets 36 x 9 inches in dimensions, and from them various sized squares, hexagons, diamonds, strips, &c., are cut as required. The material is referred to as being water proof, sound proof and germ proof and as being especially adapted for ceilings and side walls, floors and tiling, stair treads, wainscoting, &c. For flooring the tiling is made ½ inch thick and for wainscoting, paneling and similar decorative work the thickness is a scant ¼ inch. The company refer to the material as elastic and consequently noiseless under foot, a superior insulator against heat and cold, as free from sanitary objections and as comparatively inexpensive. The pamphlet in question presents a summary of the advantages of the Nonpareil cork for various purposes, gives a list of standard patterns and describes the method of applying and finishing. The tiling is now so made that it can be sent from the factory in the form of panels, which renders any level floor suitable for its use. On wooden floors the method is said to be similar to that of parquetry and on metal or stone water proof cement is employed.

◆

The Nickel Plate Stove Polish Company, Chicago, Ill., whose line of Stove Polishes are well known to the trade, have just perfected and placed on the market a new brand of Stove Polish, known as Black Beauty. The manufacturers have been experimenting with this Polish for some considerable period before placing it on the market, and the favor with which it is being received by the trade indicates that it is destined to prove a popular Polish. It is a high grade Polish to be sold at a reasonable price, and admirably adapted for use in polishing sample Stoves.

J. F. GORMAN, Agt.,
Wilkes-Barre, Pa.

This One IS Running.

And has been, continually, since 1891. We offer at a BARGAIN price our business—that of manufacturing warm air registers—including names of customers, brass patterns of excellent design, Japanning oven, upright drill, emery grinders and other tools and appliances, as well as the prestige of eleven years at the same location. The business may be continued (not resuscitated, as it is ALIVE) at the same place, or advantageously added to that of any foundry, furnace manufacturer or maker of hardware. The latter half of the year is the busy season, and the building boom guarantees an exceptional demand at present. Our goods rank high; we refer to all with whom we have had dealings, in respect to our reputation.

RIVES & CO., Rochester, N. Y.

FOR SALE,

or will organize company, giving capitalist great opportunity to make good investment for manufacturing patent chimney cap and ventilator, for railroads, buildings and general use. Investigation solicited.

CARPENTRY AND BUILDING

Series No. 2.

Modern American Dwellings

With Constructive Details.

The Most Elaborate and Complete Volume of Plans Ever Brought Out for the Use of Architects, Builders and Home Seekers.

BY NUMEROUS ARCHITECTS.

A selection of thirty-seven designs of artistic suburban dwellings erected in various sections of the country, at a cost ranging from $2,000 to $5,000, and embracing floor plans, elevations and constructive details showing interior and exterior finish, all drawn to a convenient scale, together with brief extracts from the specifications.

Those who contemplate building a home will find this volume of great value. In connection with each design is given the necessary floor plans, elevations and constructive details as will enable any practical builder to execute the work. The plans are diversified in both the interior arrangement and external appearance, and will afford to persons of various requirements an opportunity to select a home suited to their taste and convenience.

33 Half-Tone Engravings. 127 Full Page Plates of Elevations, Floor Plans and Constructive Details. 40 Pages of Descriptive Text. Size 9 x 13 in. (oblong), Handsomely bound in cloth. PRICE $2.00.

POLYGON

CONDUCTOR PIPE.

In presenting our Patent Polygon Sheetmetal Conductor Pipe, we feel confident that its merits are shown sufficiently in the cut to not require a long description.

The pipe is expansive. Through its peculiar polygon scalloped spiral construction, producing sufficient expansion and resistance, an artistic effect is also secured, not possessed by any other conductor pipe in the market.

Ice forming in it will not, by slipping, as in other conductors, burst joints and seams, but will descend gradually, without injury to the pipe. Water, in heavy rains, will discharge more freely, as the pipe will not choke.

Considering quality of material used and workmanship required in producing the pipe, also the durability and design obtained, the Patent Polygon is, besides being the best, the cheapest in the market.

ARE YOU A BACK NUMBER?

You are if you use galvanized sheets. Be progressive and use Aluminum Coated Steel Sheets. The most durable coated sheet on the market. Can be soldered with common solder.

THE STEEL & IRON ALUMINUM COATING CO.,
CONNELLSVILLE, PA.

WHY

Metal Tile is everywhere being used instead ot Terra Cotta:

It has precisely the same appearance, is cheaper, more easily laid, cannot become loosened, will not break and never needs repair. Of course, we are talking about the ***MEURER METAL TILE*** which is the only one made that we can truthfully say so much for. There are other metal tile, but ours is faultless from a practical point of view, and from an artistic standpoint they are incomparable.

We have small models which we supply free of cost—our catalogue also wherein the Tile is illustrated and fully described.

We will gladly quote prices on Tile made of any Sheet Metal desired, either for straight roofing or in Graduated form for Towers.

The Finishing Touch

to a building estimate is to specify M F Roofing Tin. It is the best roofing material—perhaps just a little more costly at first; but it will last more than half a century; will not rust, or leak. It is the world's standard for roofing tin.

M F Roofing Tin

is made by the old-style hand process. It carries the heaviest coating of pure tin and new lead. Every sheet is carefully inspected and only perfect plates sold. This (MF) mark stamped on every sheet. Ask your roofer, or

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.
Filling and Firing a New Kettle.
The Use of a Pyrometer.

TEAM WORK

Team Work.

Of many a metal ceiling it may be truthfully said that it shows a shocking disregard of even the first principles " of team work." In other words, the different parts of the ceiling do not harmonize with each other, hence the result is plainly a conglomeration. Berger's Classik Metal Ceilings avoid conglomerations. Berger's Classik Metal Ceilings are made in a series of complete and artistic classified designs. Each classified design embodies all the pieces necessary for a variety of complete and artistic ceiling combinations in that style. Berger's Classik Metal Ceilings leave no excuse for unartistic combinations or mixture of styles. Get our catalogue and see for yourself. We mail it free upon application.

Ceilings.
An Argument.

When accepting the agency for a line of ceilings, remember that time means money to you, and if it takes twice as long as necessary to erect a cheap metal ceiling because of faulty construction, what matters a few cents difference in the original price? You depend on making your profits by the time it takes to put the ceiling in place. Get

"CANTON" CEILINGS

METAL CANTON CEILINGS

and you have a winner. They are artistic in design and are easy to apply because all parts match perfectly, alignment is straight and regular and joints are tight fitting, requiring no putty to close cracks, which will mean a saving to you of 50 per cent. in labor.

Let us demonstrate what we say. Give us a trial order and others will follow.

Complete assortment of classified designs.

LITTLEFORD BROTHERS,
453-55-57 Pearl Street, - CINCINNATI, O.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
  1. MITER CUTTING.
  2. FLARING WORK.
  3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

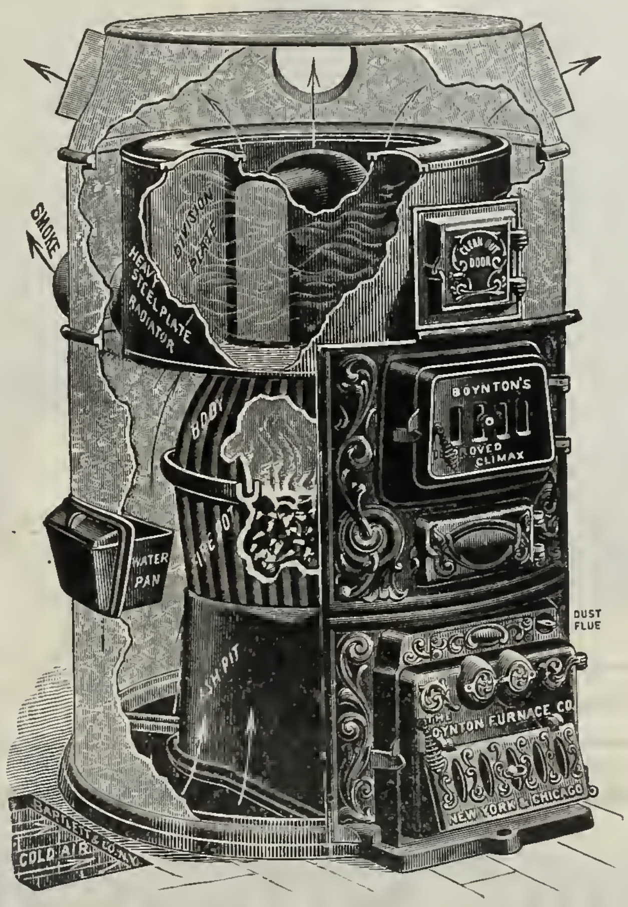
Boynton's Improved Climax Furnace



THE CLIMAX FURNACE, patented in 1884 and placed on the market the same year, has been more extensively imitated by manufacturers throughout the country than any type of furnace made. We have in the construction of the Climax Furnace provided for such superior weight of metal as to insure resistance to many years of wear and tear.

We now present it with its latest dress of modern design.

The practically minded dealer will agree with us as to the desirability of limiting the height of the iron front (which is merely ornamental), so that the clean-out door will be independent of it and the radiator may be turned around to accommodate any position of the smoke pipe, and not be confined to a back outlet, as with all high front furnaces.

The gas dome over the fire, both in the Steel Plate and Cast Iron Radiator, is of heavy cast iron, which affords a measure of durability far superior to the sheet iron construction at this point common to so many cheap imitations of this furnace.

The travel of the heated products of combustion throughout the entire circuit of the radiator is invariable; the entire volume of heat being applied to all the heating surfaces of the radiator, renders its efficiency double that of a radiator with the half circuit of a divided current common to so many furnaces.

Fitted in the best manner; doors mounted with bronze hinge-pins, upright shaker bars, anti-friction, clinker-clearing, draw-center grate, or the patent triangular revolving grates as desired; has dust-flue, obviating dust when clearing grate.

OUR CATALOGUE WILL INTEREST YOU.

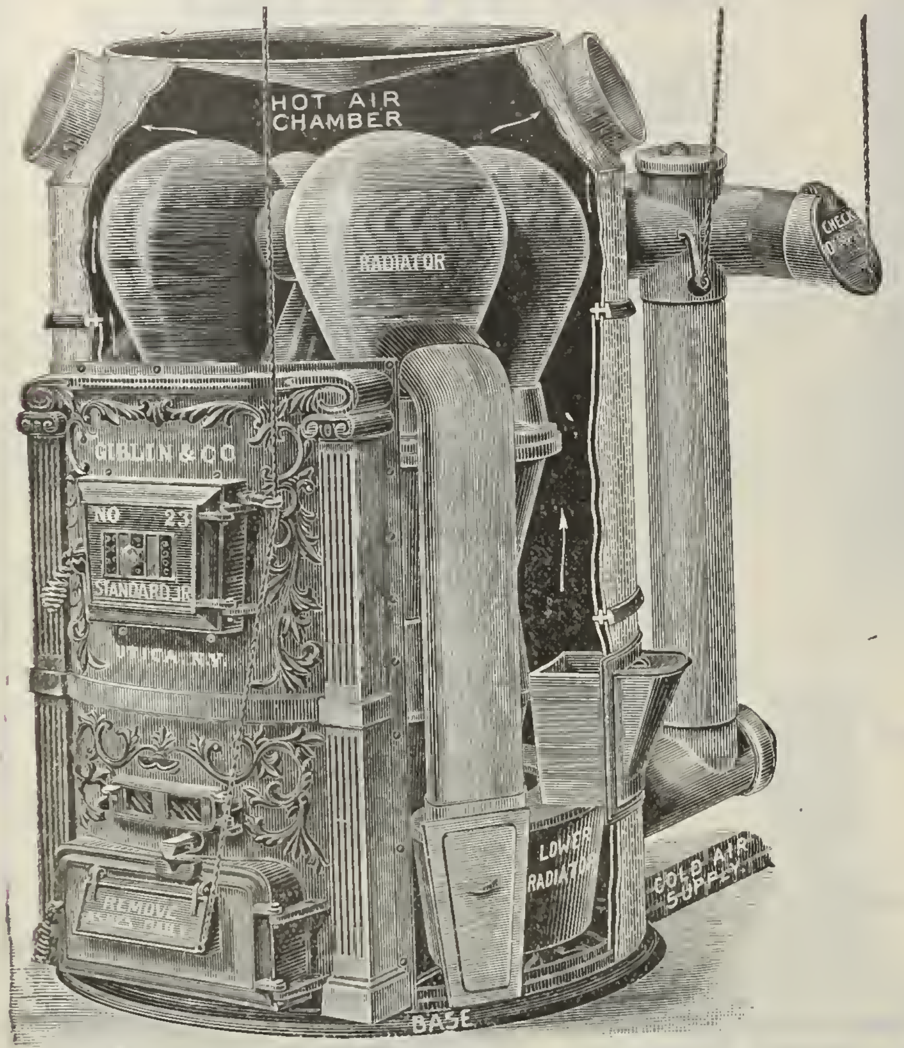
MILWAUKEE, WIS.

TOUCH A MAN'S POCKET

and you touch a sensitive spot. If your customer asks for a furnace and you furnish him with the cheapest furnace obtainable, it surely is not the best and he will judge all other furnaces by what he gets. He will, by using the cheapest furnace, burn more coal than he should; will burn it imperfectly.

IT WILL cause more work, need frequent repairs, make him thoroughly dissatisfied. Such are the results of a direct draft furnace. We present the furnaces illustrated herewith to

SHOW what indirect draft furnaces can accomplish. Nobody now uses a direct draft heating stove, because of the waste of fuel and the impossibility of regulating it.



These Furnaces are in furnaces what base burners are in stoves and Secure for the user the benefit of Heat without wasting fuel. They are operated with a steady low fire, providing an even continuous temperature In Every Room.

Whichever dealer secures the agency of these furnaces is sure to get the bulk of the business; and because he is selling something different from all other dealers will make sales at a good profit and make every one sold an advertisement for his business.

Dealers who have sold other furnaces and have found no profit in the business should investigate the merits of these furnaces and secure the agency and exclusive territory.

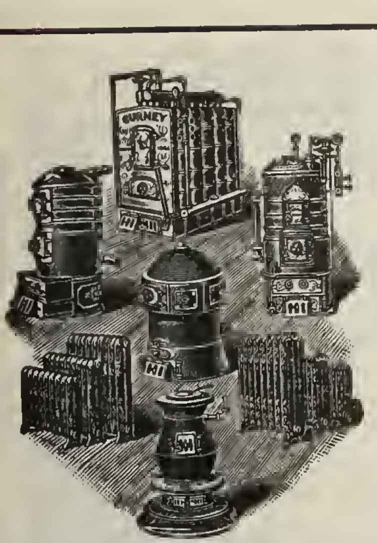
The Financial Argument.



Some of the heaters on the market are not worth their price because better value can be secured for the same money. That's the great argument in behalf of

"GURNEY" HEATERS,

BRIGHT IDEA DORIC and 400 SERIES.

They furnish decidedly greater value yet they cost no more than ordinary heaters. Not only do we say so but a host of testimonials from present users corroborate this statement.

That one fact alone ought to be sufficient to induce every dealer who wants the fullest measure of business to handle "Gurney's." If you are in that class we shall expect to hear from you relative to an agency. Latest trade catalogue for the asking.

IF YOU ARE NOT SELLING THE

Peck=Williamson Underfeed Furnace

you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

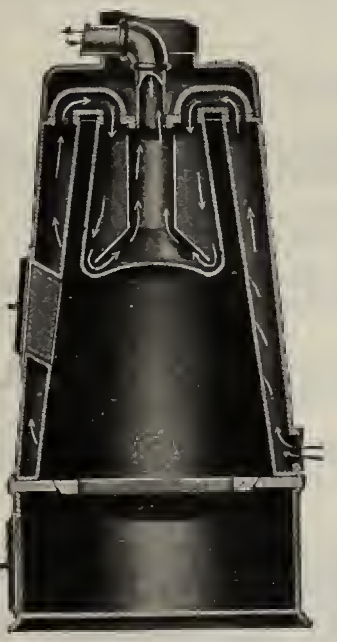
A Transformation is Coming



One of the Davis Heaters.

THE war between the coal miners and coal mine owners is the golden opportunity for pushing petroleum and its products for domestic heating which owners of oil wells will not be slow to take advantage of.

The Davis Water Heaters present a broad sheet immediately above the fire over which all the water is constantly passing, thus keeping the sheet cool. Under this large sheet is a fine place to put a petroleum burner, changing the fuel for the heater from coal to oil, retaining its economical character.

Illustrated circular sent promptly on request.

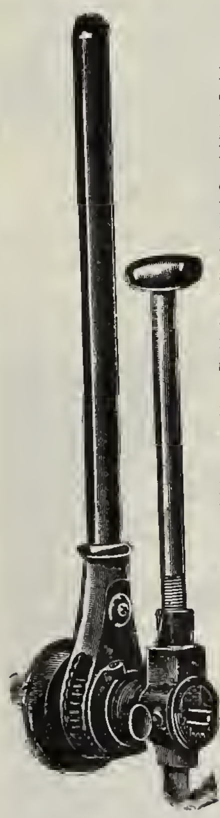
The Climax

RATCHET STOCK



Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00.

The June Conventions.

That June is peculiarly the convention month among most of those trades to which *The Metal Worker* is devoted has been already indicated by the notices of such meetings which have been presented in our columns. The benefits derived by the coming together of men identified with the same branch of trade are so fully recognized as to secure not only a large attendance, but one composed of representative men, whenever the call for trade conventions is issued. It is not only the discussion of important questions at the meetings, but the opportunity afforded during the social hour for the exchange of views and experiences, that make these meetings of tradesmen of substantial value. The selection of Atlantic City as the place for holding so many of these gatherings this year is calculated to give them additional value. The complete change of scene should have the effect of broadening the views of those who are delegated to legislate for the trades they represent, and it may be reasonably expected that the results of the deliberations of these tradesmen will reflect some of the pleasantness of the surroundings. We wish each body a successful meeting.

The Steam Fitters' Convention.

The first meeting will be that of the National Association of Master Steam and Hot Water Fitters, to be held June 12-14. While the deliberations of this body have for their principal object trade protection, this feature is by no means the only thing that benefits its members. Operating along lines which have been suggested at these meetings, the use of uniform methods has been introduced with great advantage throughout the country, while the effect of these trade discussions has also been seen in the elimination of bad customs. The association is now endeavoring to secure the general use of a uniform contract for the same class of work, as well as to avoid being held to the unreasonable guarantee that was formerly exacted from the heating contractor, and the reservation of the heating and ventilating work from the general contract. The association has been fortunate in its executive officers for a number of years and is entitled to the prosperity which it now enjoys.

The Heating Engineers.

The next important event will be the summer meeting of the American Society of Heating and Ventilating Engineers, who will have a one-day meeting on Monday, June 16. There will be morning, afternoon and evening sessions, devoted to papers furnished by members, to the discussion of topics of interest to this branch of engineering and to the reports of some special committees. The meetings of this society have always attracted considerable interest, and it is entitled to the consideration of all identified with the designing and installation of heating and ventilating apparatus. The society has already done an important work in bringing together engineers engaged in designing such systems and in the production of appliances used in their installation. The published proceedings of the body have become esteemed as valuable works of reference in the libraries of our colleges and scientific institutions. The heating trade generally has profited from the valuable papers on special work which have only been secured as the result of the society's existence. The discussions have covered all branches of heating and are of interest alike to the furnaceman, the steam and hot water heating contractor and those who install forced blast systems for both heating and ventilation. We have no doubt that this summer meeting will equal the former meetings of the society in the value of the papers presented and in the discussion of them.

The Plumbers' Convention.

The third notable gathering is the convention of the National Association of Master Plumbers on June 17-20. These three important meetings coming together at the same place will make Atlantic City long remembered in trade annals. It marks a departure from the custom of holding the plumbers' convention in some large trade center, and introduces the wise innovation of meeting at a pleasure resort where the members can enjoy the exchange of opinions on topics presented for their consideration under unusually pleasant conditions. It also removes the burden of expense for entertainment which heretofore has been laid upon the members of the local association in the convention cities, inasmuch as the place selected for holding the convention affords a continual entertainment for all who attend.

Other Meetings.

The occurrence of the gatherings already mentioned at Atlantic City has afforded opportunity for the meeting at the same place of other important although less conspicuous bodies. June 13 has been selected as the time for holding a conference between the National Committee of the Confederated Supply Associations and the officers and Executive Committee of the National Association of Master Plumbers, and the interests of the heating trade being so closely associated with those who attend these conventions has doubtless been the reason that the manufacturers of heating boilers have selected Atlantic City for holding their regular monthly meeting on the same date.

Peace in South Africa.

By far the most important event of the week is the peaceable settlement of the prolonged and bitter struggle in South Africa. As has been evident from the beginning of the war, the result is the establishment of British supremacy in South Africa. But this has been accomplished only after a conflict involving immense sacrifices on both sides. The Boers have yielded after a gallant struggle of nearly three years' duration, which has commanded the sympathy and admiration of the whole civilized world, including their opponents. The British have granted to them such generous terms of peace as reflect honor upon the victors. It is a settlement that should make for conciliation and the establishment of friendship between the races that heretofore have been antagonistic. It gives ground for the expectation that in the South Africa of the future British and Boer will merge into a common prosperity and progressive civilization. To this country the establishment of peace means the opening up of a favorable market for American products in South Africa. Already our exporters are preparing for a great extension of trade with that country, where a vast quantity of goods of all kinds will be needed immediately to repair the ravages caused by war, and to set the people on their feet again. Moreover, it is a market that will grow indefinitely. With its immense natural wealth, much of which is yet undeveloped, South Africa promises to become, in time, one of the great industrial and commercial centers of the world. There is no doubt that the United States will get its full share of the future trade of that region.

Damage to Freight in Transportation.

Every branch of trade has suffered loss through the rough handling given to goods shipped by the different railroad companies. In another column we present a letter from a large house, centrally located, who ship goods such as are used by many of our readers and handled by the wholesale houses catering for their trade. No tradesman escapes the annoyance of having goods broken, damaged or delayed in transport by rail. Wherever efforts have been made to secure reimbursement for these damages, losses, or delays, the experience has been the same. The delay and " red tape " methods met with are so annoying and exasperating as to have largely discouraged effort in this direction. The railroad companies appear to entertain the opinion that these annoyances, losses and damages are something for which they should not be held responsible. It seems to those who come in contact with the working of these transportation corporations that the average claim department is provided by the companies for the purpose of withholding satisfaction, rather than of affording it speedily. The greatest energy expended in the claim department seems to be devoted entirely to the company's interest in standing off claims rather than to caring for the best interests of their customers. It appears to those who have claims to present that the railroad managers fail to give any attention to their responsibility in this matter. The claim department of a railroad company is usually administered on a totally different plan to the claim departments of other business concerns. In other branches of trade the good will of the customer is an object of close attention, and, on the report of a claim, effort is usually made to adjust it satisfactorily at the earliest possible moment. Houses who pride themselves on the promptness with which they themselves remove all such cause of annoyance are, nevertheless, forced to accept the indifferent attention which the railroad companies give to their claims. This indifference on the part of railroads has forced some large business concerns to employ one or more men to keep up the fight with those corporations in order to secure the justice to which they are entitled. Various trade and business associations have given attention to this annoyance from time to time, and in this age of consolidation, if all kinds of mercantile associations would consolidate their interests in the support of a bureau of justice, and employ skillful and experienced lawyers to prosecute claims on the railroad companies, the cost of the suits would be inconsiderable to the members, while the effects would be sufficient to attract the attention of the railroad companies and bring them to a sense of their duties as carriers of goods for customers.

Immigration at Flood Tide.

A notable result of the present remarkable business prosperity in this country is the tremendous growth in the tide of immigration attracted to our shores. More than 90,000 foreigners were landed at the port of New York last month, making by far the highest monthly record in the statistics of the Immigration Bureau. This makes nearly a quarter of a million immigrants who have entered the principal gateway of the republic since January 1 of this year, as against 180 in the same period last year, an increase of about 35 per cent. Such an inflow has never before occurred in so short a time. Under the circumstances it is a matter for congratulation that the Government has instituted a system for the more careful inspection and scrutiny of immigrants before they are landed, as it is inevitable that, among such a mass of people coming from the other side, there must be a considerable undesirable element. A feature of the present immigration movement that is by no means satisfactory is the statement given out by the immigration officials that a large percentage of the recent comers is composed of an inferior class, who have not sufficient enterprise or energy to travel inland and help build up that portion of the country that needs their presence, but are content to settle down in New York and the cities on the Atlantic seaboard, swelling the already overcrowded ranks of cheap labor and herding in the congested tenement districts of the cities. This country has ever a warm welcome to all comers from over the sea, who are of the right material to make sound and useful American citizens. Honest, vigorous workers, who are willing to go into the country and work on farms or out West to populate the growing sections of the country are wanted and are welcome. But there are already too many unskilled and unenterprising foreigners in our Eastern cities, who know nothing of any trade or handicraft and who are content to eke out a precarious subsistence by doing odd jobs. Such immigrants are not desirable acquisitions. In view of the present flood of immigration, it is to be hoped that the Government officials will enforce the immigration laws firmly and strictly with a view of keeping out, so far as possible, that class of immigrants who are liable to swell the criminal or pauper element in this country.

◆

According to the *Aluminum World* the use of aluminum transmission lines has been steadily growing since 1896, when aluminum cables began to be used at Niagara Falls for conducting the current from the power house at the bottom of the cliff to the reduction works at the top. Aluminum lines have been erected in all sections of the country, but particularly on the Pacific slope, where there has been a remarkable utilization of mountain water powers. Interesting reports are published in the May issue of that journal of the satisfactory service rendered by the aluminum lines used by the Bay Counties Power Company and the Standard Electric Company of San Francisco and by the city of Healdsburg, Cal., as well as the Leavenworth Railroad Company, Walcott, Kan., and the Hartford Electric Light Company, Hartford, Conn.

HOW WILL CONSOLIDATION BENEFIT THE SMALL MANUFACTURER?

The subject of consolidation in the stove manufacturing industry is evidently receiving considerable attention throughout the trade. Presumably the article on this topic by a prominent manufacturer presented in our last issue has inspired the communication from a leading stove man in the eastern section of the country given below. While wishing it to be distinctly understood that we are not to be taken as indorsing the views of our correspondents, we take the opportunity of stating that the columns of *The Metal Worker* are always open to the discussion of any topic of interest to the trade, and that we gladly present any communications that may be sent to us on this particular subject, believing that a full and free discussion will be to the best interests of all concerned. Our correspondent writes as follows:

How Will Consolidation Benefit the Small Manufacturer? Starting with such a question, let us suppose that the small manufacturer has sold out his plant at an agreed price and at terms that were agreeable to him. From that as a starting point, let us consider how he is to be benefited His benefit on the sale of his plant he already has. He knows what that is, for he can count it. But what else there is for him in the future he cannot count so easily. Probably he has employment by the consolidation, if he is one who is considered desirable to run that plant or section of plants. But if he is not so fortunately situated as to be found necessary by the consolidation for the running of the plant or section of plants, he has his time to himself, and can take the needed rest he no doubt has felt he would like, but did not dare, to take while running his own business, for fear that while he rested his competitor would lie awake nights to lay plans to get away his trade and dig pitfalls for him to tumble into. He can now take his ease, assured that when he gets rested he will find his investment fully as well cared for. He has benefited to the extent that he is one of the Board of Directors of the consolidation, and as such has a vote in determining the policy of his former plant along with those of his neighbors, and all that benefits them benefits him. He knows, from the fact of being one of the board, that he must think for them all and need not worry about his competitor, as he always had to do in the past.

If the success of consolidation is his success, he must think for it, but he will not have to do the hard sweating in his thinking that he had to do as an individual manufacturer. He will have others to help him, who, in all probability, have had a larger and wider experience, which will tend to benefit him and awaken in him a new and larger power of mental vision. His duties on the Board of Directors will not take his time to more than a limited extent, if he is not otherwise employed by the consolidation, so that with his experience he can employ his time in any congenial occupation he desires. If the consolidation is a success and the man who sells out is one on whom that responsibility rests to a certain extent, he will be benefited far and above anything he could hope or dream of acquiring if he had sold out to some individuals in the ordinary way in which a business is disposed of. In the consolidation he has a certain voice in the management. In the ordinary way he would, in nine cases out of ten, sell for less to start with and then have nothing to say in the future management of the plant, even though he may hold a mortgage thereon. In one case he knows, because he has a share in making it, how secure his securities are. In the other case his securities may be jeopardized and impoverished, and he would not have the slightest power to prevent it until the crash comes.

Is a voice in the management of his own securities of benefit to the small manufacturer, when he has time to engage in another occupation to add to his income? What small manufacturer can sell his plant so advantageously as he can now to the parties who are forming the proposed consolidation? What large manufacturer can sell his plant so advantageously as he can now to these same gentlemen? What large manufacturer but is tired, so tired, of this everlasting worry over thousands of matters that consolidation would eliminate? The same holds true of the small manufacturer; and with the small manufacturer things are growing worse. The lines are being drawn tighter about him, so that he will not be in it at all some day. To him I would say: Are these benefits of sufficient importance to your life, to your health and to your future happiness to warrant your consideration?

NEW YORK STOVE PRICES ADVANCED.

Evidently the benefits resulting from the work done by the Association of New York Stove Manufacturers for a couple of years, even though it has latterly been out of active existence, have aided materially in promoting conferences of those who have mutual interests to conserve. This is shown in the meeting of manufacturers held in New York City this week, at which the advisability of advancing prices on certain lines of heating stoves was considered. As a natural result of the conditions which now obtain there was no opposition on the part of any of these independent houses to an agreement to advance prices, making some exceptions where they were necessary. Some classes of goods have been sold in the New York market apparently with no other purpose than to supply the demand and without returning a profit to those who manufacture them. This has been due, it is claimed by careful observers, to the fact that no association has existed for some time. The tendency when all act independently and they do not confer even occasionally is to meet prices that are reported to prevail. Those who are most conversant with the aims and results of the old association state very positively that more money was made during its active existence by the local stove trade in New York than either before or since. The outcome of the recent conference is evidence that an association would be very useful and invites another effort at organization. If too much was not attempted there is little room for doubt that the stove manufacturers of this locality could again be united in an association with great benefit to all concerned.

THE GAS AND OIL STOVE TRADE.

Reports from the stove trade in New York City show a marked activity in the movement of gas, oil and gasoline stoves. Naturally, the warm season approaching and the wider familiarity with the use and benefit to be derived from liquid fuel stoves makes this branch of trade active among the out of town dealers. In New York City and the larger towns nearby in which gas can be readily secured at reasonable prices the advertising done by the gas companies to increase the sale of their product is showing a marked effect in the demand for gas stoves. The advancing price of coal in all sections is a further incentive to consumers to give a more appreciative attention to the efforts of the stove dealers to sell gas and oil cooking apparatus. Those handling this class of goods are already having their capacity tested for making prompt shipments.

"THE F. & W. COMPANY FURNACE" is the title of a pamphlet just received from the Fuller & Warren Company, Troy, N. Y., devoted to their 700 Series Hot Air Furnace, which is made with a one-piece cast iron return flue radiator, and adapted for the use of both hard and soft coal, a slight difference in the construction through the arrangement of flue plates being made in the soft coal Furnace. The Furnace is made in four sizes, with 20, 22, 24 and 26 inch grates. The same Furnace is presented in the 300 Series with a steel radiator, with a more extensive variety of sizes, beginning with 16-inch fire pots and ending with fire pots 35 inches in diameter. The Furnaces are provided with a handsome front, labor saving grate and all the conveniences of a high grade Furnace.

ON MOISTENING AIR.

BY IOWA.

Many important and new propositions are being presented through your paper; many very important suggestions are being made along the line of new methods of heating and furnace construction. Stick a peg down whenever a valuable thought or bit of experience comes along. The business of heating is being revolutionized. That item in the Rochester *Free Press* about moistening the air of school houses opens up a wide subject. It strikes at the whole method of ventilation. Note the following points of importance:

Air at a temperature of zero and below will not carry over 1 grain of moisture to the cubic foot. Raised to a temperature of 70 to 80 degrees F. it demands 8 to 10 grains, and everything in the room filled with such air will give up its moisture to the air until the air is satisfied. Here is an important fact which you are to nail to—which must not be forgotten. I dug this fact out of technical works on natural philosophy a number of years ago, and it has been a guide to me ever since. It is in harmony with this fact and under its law that fruit dryers are constructed, also lumber dryers, codfish dryers and heaters for drying the juices out of school teachers and school children. That "15,000,000 cubic feet of air driven through the rooms and halls of the new No. 6 School Building daily" would dry over 10,000 bushels of Baldwin apples every day; but, not having the apples, it hugs the pretty school teachers and dries up their delicate skin and takes the luster out of their eyes, dries up their lungs, throat and nasal passages and wilts them, damages them all around. And it does the same for the children. It has been ruining more weak eyes than all the bad lights architects have ever devised, and causing more headaches and dullness than any other causes. The hardest fight we have had to make in our heating business has been to get people to realize the great importance and value of our method of softening the air by giving it the required moisture.

A REMEDY.

In one of my former articles I spoke of ceiling ventilation for school houses, churches, opera houses, &c., provided with valves for opening and closing. Now I expect I will have another army of "old timers" after me when I deliberately announce that the passing of 15,000,000 cubic feet of air through the school rooms of No. 6 (Rochester) School House is about on a par with the old-time method of the Iroquois Indians, who awhile back were the residents of the Rochester country, who built a big fire under the shelter of a grove and squatted around it, according to the direction of the wind, trying to keep warm. I know I am getting on perilous ground, but I have my back up against a rock and must be attacked from the front. My first defender will be the statement in the said article: "To supply the desirable moisture requires as much horse-power as is required for supplying pure air." The condition of the Rochester people is that they spend twice as much for coal as they ought to to warm their building. They have to spend as much more to keep their handsome school teachers and beautiful children from being desiccated. In most towns where they have these fresh air, multi-million cubic feet heaters, they let the teachers and scholars desiccate, and when one set of teachers are dried up they introduce fresh girls to take their places, while the romping boys and girls manage to partially recuperate in vacations, &c., and by staying out of school when sick long enough to take in sufficient moisture and freshen up for another process of drying.

VENTILATION.

How can these evils be remedied? I make the following suggestions: In all assembly room heating and in the heating of school houses, the thing to be accomplished is to get rid of the foul air in the upper half of the room. In an opera house, when the audience has been gathered for 30 minutes, the air in the upper galleries becomes almost unbearable, while the air in the lower half of the room is comparatively good. All of the fresh air coming into the room goes to the floors. All of the bad air from breathing and from foul bodies being heated to near 100 degrees goes toward the ceiling. This is the body of air to get rid of. The carbonic acid gas mingling with it does not attempt to come to the floor. Valved ceiling ventilation comes in here. It does the work, and one sniff of the air that passes through one of these ceiling ventilators will cure the worst case of old-fogy nonsense that can be found.

Here the "rotary man" comes in again. Instead of using "15,000,000 cubic feet of air a day" in that Rochester school house, he would use the "rotary air" movement to warm the building, and only admit fresh air, moistened, during the session of the school. By the use of the valved ceiling ventilation this enormous amount of fresh air could be further enormously reduced and the conditions all along the line be greatly improved. These suggestions are not costing anybody anything, and the probabilities are the "15,000,000 cubic feet" process will go on indefinitely.

Round Oak Year Book for 1902.

"Distinctively Beckwithian" must be the judgment of every lover of fine catalogue work into whose hands may come a copy of the Round Oak Year Book for 1902, just issued by the Estate of P. D. Beckwith, Dowagiac, Mich. Every detail of this publication reveals the artist and the accomplished book maker. It fully meets the expectations of those who have observed the high standard of the trade literature issued by this progressive establishment. The size adopted, 7½ x 9 inches, makes it convenient to handle and sufficiently large to permit the use of engravings of the liberal proportions which are desirable in the case of some goods. The leaves are sewed together instead of being wired, so that the book lies flat when opened at any place. Thick black paper is used for the cover, this color making a most effective background for illustration and lettering. The front cover bears an illustration of Doe-Wah-Jack, the Beckwith trade-mark. As represented here, he is a noble specimen of the Indian race, posing magnificently in the light of a fire which casts a ruddy glow over his statuesque form. The lettering is silver. The engravings used in the book are exquisite reproductions of photographs, which, with few exceptions, are placed on the right hand page, with descriptions or price-lists on the opposite page.

In the arrangement of the contents, heating stoves are given first place, as would naturally be expected of the manufacturers of the Round Oak. Next come steel ranges, which are followed by cast ranges and cast cooking stoves. Furnaces bring up the rear. The heating stoves illustrated comprise the original Round Oak, with the new hot blast for the perfect combustion of soft coal, with magazine for hard coal and with extra half section for additional heating surface; the Round Oak room heater, with and without casing; the new Beckwith hot blast for soft coal and the new Beckwith air tight for wood. The Round Oak planished steel range, represented as the highest type of this construction, is shown in a variety of styles.

The department of cast cooking goods describes the Round Oak cast range, with six holes; the Round Oak kitchener, with six holes; the Round Oak Standard range, with six holes; the Round Oak special range, with four holes; the Round Oak Standard cook and the Round Oak cook. The furnace department gives numerous illustrations and full details relative to Round Oak furnaces for warm air heating and combination heaters.

In an accompanying circular Manager Fred. E. Lee states that the sales of the genuine Round Oak up to March 15, 1902, were very much in excess of any previous year, also that the sales of the Round Oak furnace were nearly double those of 1901 at the corresponding date. He calls particular attention to the new Hot Blast, characterizing it as a distinct step forward in the manufacture of this class of heating stove.

THE READING STOVE WORKS, Reading, Pa., have decided to increase their capital stock from $400,000 to $600,000 for the purpose of extending the plant and improving the financial policy.

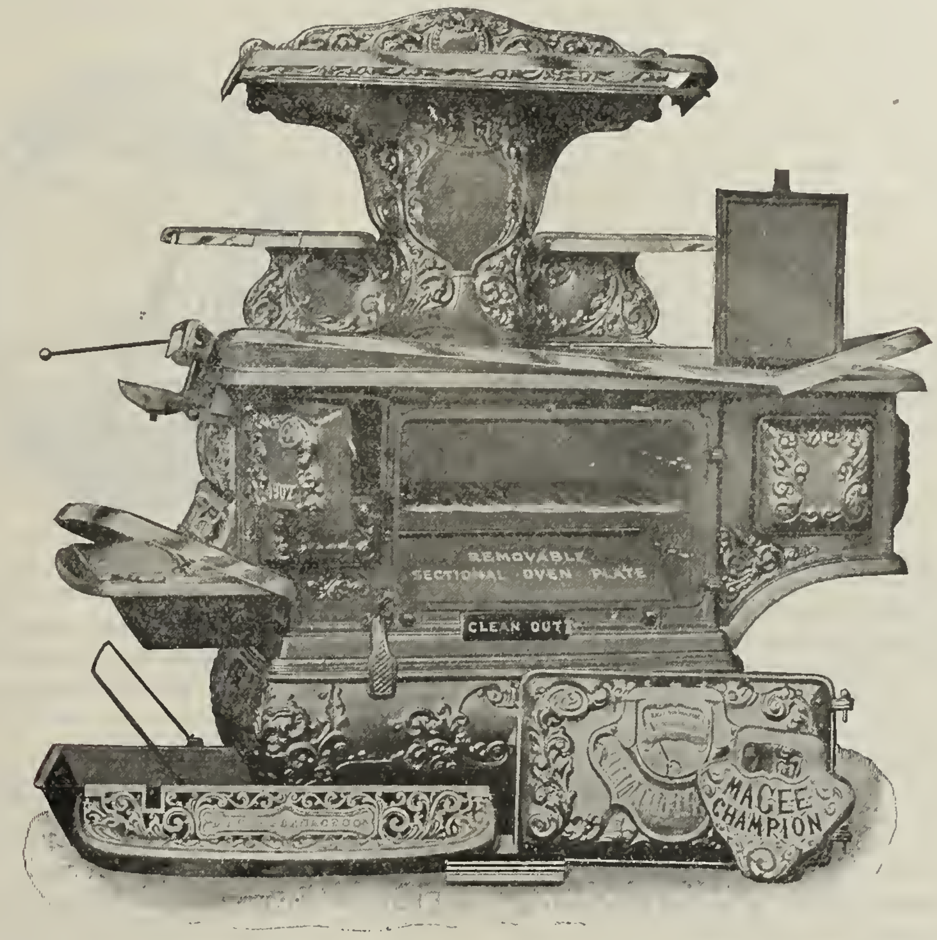
SETTING FURNACES.

BY N. R. R.

Much has been said and written in *The Metal Worker* about hot air furnaces and their location. I would like to say that when I can set a low furnace with a pitch of at least 1½ inches to the foot in the hot air pipe, a generous cold air inlet from the north or west side of the building, and registers having openings of an area greater than the area of the hot air pipe, with the hot air pipe running directly from an elbow in the top of the furnace, I seldom fail in giving satisfaction to my customer. When there is not sufficient hight to give this amount of pitch to the hot air pipes I always place the furnace in a pit. The old McGregor furnaces, placed according to the above rules, always gave satisfaction.

The Magee Champion Range.

One of the latest additions to the already extensive line of specialties turned out by the Magee Furnace Company, 32 to 38 Union street, Boston, Mass., is the handsome range offered under the name of Magee Champion and illustrated, partially dismounted, in the accompanying engraving. Constructively it has a large round cornered fire pot, lined with fire brick, for burning coal, or heavy corrugated cast iron for burning wood. There are four styles of grate which can be used. It has a special flue system, which is claimed to give an even distribution of heat around the entire oven, while an extra flue at the back permits the use of a top flue the full size of the oven, thus rendering equally useful all the boiler holes in the top surface of the stove. The fresh air is continuously carried into the oven through perforations in the door and passes out through holes in the rear of the oven, and thence to the chimney. The oven door is fitted with a heat indicator, thus showing at a glance the temperature within. The illustration which we present herewith shows how easily the nickeled parts can be removed for cleaning or for blacking the range. It also shows the removable bottom oven plate, which is made in two pieces, with locked square edged plates always flat and level. The ornamentation is rich and effective and the high shelf brackets have extension slides, shown in the engraving, which are very useful when large dishes or platters are to be kept warm. Special reference is made by the manufacturers to the patent flush top reservoir, which is heated by a cast flue, the point being made that the water can be heated very quickly and perfect operation of the oven maintained. The company have issued a neat eight-page folder calling attention to the Magee Champion and showing some of the special features incorporated in its construction, as well as several of the varieties in which it is offered to the trade.



The Magee Champion Range Shown Partially Dismounted.

S. Obermayer Company.

"Foundry Facings" is the title of a short treatise by the S. Obermayer Company of Cincinnati. The most common facing is sea coal or bituminous facing. This is the only facing known which is not put on the face of the mold, but is mixed with the sand in the proportion of one shovelful of coal to 10 or 20 of sand. This mixture is placed nearest the surface of the mold in order to break up the particles of sand, which is then not so liable to fuse when the metal is run in. The coal cokes and passages are formed for the escape of the gases. This leaves the sand in a separated condition, so that when the casting is cooled the particles of sand will drop off. All other facings are dusted on the mold, applied with the hand or with a camel's hair brush, and can be used wet or dry, as the work may require. In order to produce a good casting a facing or blacking is needed that will close up the pores of sand on the face of the mold and so produce a smooth surface or veneer. The best material for this is what is termed plumbago or silver lead. Mineral facing is made from an anthracite coal or low graphite carbons, and is used on work when a particularly smooth surface is not required.

At a recent meeting of the stockholders of the Summit Stove Works, Geneva, N. Y., it was voted to increase the capital stock from $75,000 to $100,000. The number of directors was increased to seven, as follows: Henry A. Wheat, J. J. Maxwell, Roger Hogan, J. F. Quay, William Reid and Charles H. Huke of Geneva, and G. W. Loomis of Rochester.

The Southern Stove Works.

We understand that the Southern Stove Works of Richmond, Va., are meeting with a very gratifying demand for their specialties, and that orders have already been booked which will keep their plant running very nearly full capacity for the balance of the year. They are bringing out a new "Air Tight" stove, embodying features which the makers are confident will render it popular with the trade. Heretofore the company have confined their productions to standard stoves, but are now giving attention to sheet steel stoves and ranges and are bringing out a full line of oil and gas stoves. The equipment for this line of their business is of the very latest design, the necessary dies and machinery having been manufactured especially for them by the E. W. Bliss Company of Brooklyn, N. Y.

The plant which the company now occupy covers 5 acres of ground located at the corner of Hermitage and Leigh streets, and consists of five brick structures. The main building, which is used for storage and mounting purposes, is 120 x 240 feet, the foundry is 86 x 200 feet, and the three remaining buildings average about 30 x 50 feet. Electricity is used for generating power and lighting purposes. The receiving and shipping facilities are exceptional, as cars can be run directly into and out of the works. The tracks of the Seaboard Air Line Railroad extend along the full length of the north side of the works, and the tracks of the Richmond, Fredericksburg & Potomac Railroad extend on the south side, thus giving ready communication to all parts of the country.

The Southern Stove Works were for a considerable time an incorporated concern, when they were purchased some years ago by the present owners, Thomas Atkinson and Stanhope Bolling, who developed the business to a point demanding increased facilities. It is due to this fact that the works were removed from the old location on Main street to the plot of ground referred to above.

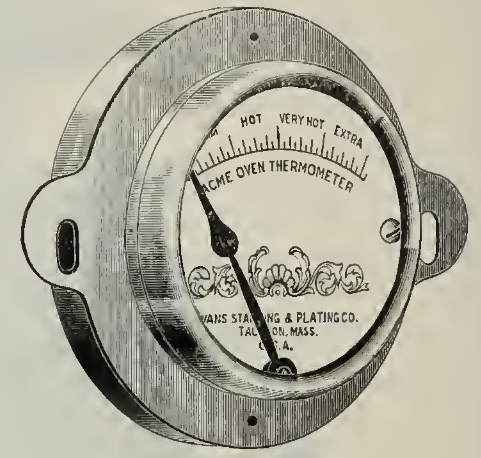
Estate Gas Appliances.

The merits of the leading lines of Estate gas cooking appliances, embracing ranges, heaters, hot plates, &c., are set forth in convincing style in an attractive catalogue which has been issued by F. & L. Kahn & Bros. of Hamilton, Ohio. The goods are presented in such variety as to meet the requirements of an exacting trade, and are of special interest just at this season, when coal is becoming scarce and the torrid weather naturally turns the thoughts of the housewife to the conveniences of gas as a fuel for cooking. The gas ranges are represented by the Select Estate, made in several varieties, one style being adapted for hotel requirements, as it can be furnished with two, three or four large single ovens or with four, six or eight double ovens, and with any combination of the large single or double ovens that may be desired; the Superb Estate, shown in series A, B and C; the Climax Estate; the Economic Estate; the People's Estate, the latter being of cast iron, and the Cottage Estate, a new low priced range of attractive exterior.

For burning natural gas the company offer the Queen Estate range, made entirely of cast iron and embodying many interesting features. Other goods include the Cooker Chief, A and B series; the Early Bird, the Gem and the Duplex Estate Cooker, mounted on high legs, for artificial gas. The Golden Estate and the Queen Estate are combination gas and coal ranges, the latter, it is said, being something new in the way of a medium priced high grade range. Another combination coal and gas range is the Star Estate. Broilers, hot plates, roasters, urns, Victor gas grates, Challenge, Peerless and Hero radiators, for using artificial and natural gas; the People's heater, as well as open front and sheet iron cylinder heaters, are among the other goods illustrated and described. What the company refer to as a "revolution in heating with gas" is a construction designated as the Triple Effect. This is what appears to be a cabinet base, on which are mounted five sheet iron pipes, presenting much the appearance of a radiator.

The Acme Oven Thermometer.

As the use of the oven thermometer is more generally understood by the housewife, the demand for these devices by stove manufacturers has increased, and whereas a few years ago this branch of industry was comparatively small, there are now several manufacturing concerns that have devoted considerable energy to their production. In the accompanying illustration we show the Acme oven thermometer, made by the Evans Stamping & Plating Company, Taunton, Mass. These thermometers are substantially and neatly made, and when attached to an oven door are not only a thing of utility, but with their nickel plated finish and white porcelain dial, contribute, if not beauty, at least a pleasing contrast with their surroundings. They are substantially made so that the slamming of the oven door does not affect their operation, nor are they likely to get out of order in shipment. The parts are so constructed that they do not rust nor corrode when carried in stock. They are put up by the company in separate boxes and sealed, making a neat package. It is claimed that this indicator enables the cook to avoid spoiling anything that she may prepare, by knowing exactly the condition of the oven and not guessing, so that when cakes, puddings or other food are put in the oven for cooking the oven is at the right temperature to do the cooking to the best advantage.



The Acme Oven Thermometer.

A Foundry Supply Catalogue.

The Osborn Mfg. Company, 1331 Hamilton street, Cleveland, Ohio, makers of foundry supplies, brushes and brooms, have just issued their illustrated catalogue No. 102, containing 100 pages. The publication covers the wide variety of goods manufactured by the concern, including the Acme steel wire casting brushes, gear brushes, Economy steel wire wheel brushes, circular scratch and satin finish brushes, Osborn and Tampico wheel brushes, molders' soft dusters or dry brushes, molders' hard brushes, platers' brushes, hand scratch and fine steel wire brushes for all purposes, furnace and heater brushes, flue brushes in steel and brass wire, pipe brushes for removing sand, &c., from the inside of cast iron pipe; hard iron stars for tumbling, and molders' wooden sprues, bench and floor rammers, long brooms and whisks, steel wire push and scrubbing brooms, dustless floor and carpet brushes, counter or bench dusters and scrub brushes. These are followed by foundry mallets of rawhide, rubber head draw hooks, molders' hand bellows, Lightning foundry sprayers, shovels, coal scoops, coal forks, foundry riddles, sand and coal screens, wooden and galvanized iron pails, foundry sprinklers, wrought iron chaplets and chaplet stems, Eureka snap flasks and ribbed and beveled flasks in a large number of sizes. The latter portion of the catalogue is devoted to furnace lamps and hand torches, vapor and oil foundry torches, steel tubular barrels, stamped steel ladle bowls and corundum wheels. Special mention is made of the company's Standard grinding machines, made in several sizes and fitted with babbitted bearings, which are equipped with oiling rings and protected from dust.

They also manufacture a line of countershafts with patent belt shifters. A variety of paint, varnish, stencil and marking brushes occupy the closing pages of the catalogue, which is furnished with an alphabetical index.

ANOTHER THING A FURNACEMAN SHOULD KNOW.

BY M. A. E.

" *Wisdom cannot give rules for acting in all cases, but it can give rules for using judgment in special cases.*"

At the outset we wish it clearly understood that we are not of the opinion that our roost is one upon which the Bird of Wisdom perches continually. In fact, for some time we have not felt conscious of his weight. Time was, years ago, when, tugging on the far end of a die stock and squeezing the handles of dull pipe tongs for our daily bread, we mused on our knowledge of the art of warming, and were strong in the belief that we had it "all" nailed down. Events have combined to kick that notion out of us, and we are now studying patiently in the School of Experience, seeking rules for using judgment, with graduation day not yet in sight.

We have discovered, as no doubt most folks in the heating business have also discovered, that each day we live brings its problem to solve. It may even be one that has, to all intents and purposes, already been solved; yet the case calls for a different application. The previous solution cannot be taken as a rule, and can only serve as a guide for using judgment.

One of the particular branches of the heating business which has impressed us with the quantity and quality of its problems is the combination hot air and hot water system. We are not hot air furnacemen, but have been called on in a great number of cases to install the hot water end of such plants. The experience gained in this work, we think, justifies us in saying that any ordinary disciple of the art who jumps in and imagines he has a cinch coming to him will get a lot of heavy jolts.

When we first took hold we found that our conception of a hot air furnace and the hot air man's conception of hot water generators and radiation combined in about the same way that oil and water mix. After a number of cases were put through, however, we understood each other better, and both learned to accomplish with reasonable accuracy what we set out to do. We made mistakes and paid for them; sometimes in cash, sometimes it took the form of cash accompanied with abuse. It always cost us something, until such time as we had absorbed experience. Then we gave more time to thinking before we started to work.

One thing we established, to our own satisfaction at least, which is that combination heating, up to a certain limit, is a perfectly successful method of warming buildings. Since that time we have derived profit from our work. We are sure that others have also made money out of this branch of heating, but not until they had gone through the mill, or had secured the services of one who had. In addition to our own mistakes we had the opportunity of studying some made by others. Being modest, we would sooner talk about the others' mistakes; hence anything referred to hereafter will be understood to be the other fellows'.

One of the first startling intimations we had of there being something to think about in combination heating was through being called in to visit a job, about which the complaint was "no heat from the radiators." We found, when we arrived at the house, that the fire in the furnace was good and fairly bright, running under very easy draft. The air coming from the registers was fully as hot as we would care to have it; the radiators almost cold. The owner was enthusiastic over the furnace and the air, but for the radiators and piping he had no good word. We examined the latter part of the system very carefully, found the radiation fully equal to the requirements of the various rooms—that is, it would be, under normal conditions of a hot water job; the piping in the cellar was well proportioned and properly graded and things mechanical in good shape generally. We considered for some little time and finally resolved to sleep over it; which we did.

We decided by the following morning to call in a furnaceman, through whom we learned that only one-half the air capacity of the furnace was in use, which, as he explained, accounted for the easy firing. It was then we were struck with an idea. From the owner we procured a catalogue of the furnace and found that this particular size was rated to carry 350 square feet of hot water radiation. After adding the different radiator surfaces together and taking into account the exposed piping in the cellar, also the risers, we found there was considerably more than 350 square feet in the total. It did not take us long to draw the inference. The job was improved very much by cutting out three radiators and adding two 10-inch hot air pipes to it. It is by no means evenly balanced yet, but the owner would spend no more money on it.

In discussing the job with the owner we asked him how it came that the furnaceman had put in so many radiators, and he told us it was because he himself had asked for them. He had heard so much about hot water and its great merit as a heating agent that he conceived the idea of warming at least one-half of the house with radiators. The furnaceman had interposed no objections of any kind, but had estimated on the work and been given the order. He had taken the owner to see another job he had done in a different part of the city, which, luckily, was balanced and worked well. This fact led to the prompt closing of the job at a good price.

Up to the time of the above difficulty the furnaceman had been an enthusiastic exponent of combination work and had indeed posed as an authority on the subject. But at the time we were called in you could not get him to approach within a dozen blocks of this house, and he spent much time and devoted much chin action to "knocking." The funny part of it is he cannot give you his reason for knocking, beyond that this job did not work; neither can he give the reason for the first one being successful.

Two other furnacemen were called in to examine this job, and, from the owner's story, we gather that they merely condemned the hot water work. They praised the hot air work mildly and pointed out where it might have been better. Both of them were emphatic and in accord on one point, that combination heating was a fallacy. One of them backed this opinion still further by citing a case he had just been to see where it had "frozen 'em out."

The following day or so we had the pleasure of overhauling this same job. The main return at a point about 5 feet away from the furnace had very foolishly been dropped into the cold air box (wood), and then connected to the generator in the furnace. A cold snap had arrived at night while the fire was low and nipped the pipe. This was afterward carried outside the box and inside the casing of the furnace covered with asbestos.

These are merely samples of our adventures in combination work, but it was from just such cases we learned the most. From these, and from our own work, we gradually gleaned such experience as enabled us to avoid expensive errors. Even yet we do not claim to have reached the gilded degree of perfection, wherein we are proof against mistakes. That stage is peculiarly reserved for those who furnish rules for acting in all cases, who calmly assure you that they never have any trouble with their work.

To those who are starting out in combination work, also to those who have already started, but have grown faint hearted because of indifferent success with it, we beg to offer a very few simple suggestions which we ourselves follow to the letter.

Consider each job of combination work as a special case and study it from all points thoroughly before ordering the goods.

Do not look on any two houses as being exactly alike in their heating requirements. There's a difference somewhere, and you'll discover it if you take the time to look.

In consulting a furnace catalogue—that is, a combination furnace catalogue—we have seldom seen the air capacity of the furnaces given. Presuming that your experience in that respect is the same as ours, we would suggest that you ascertain this capacity, and also ascertain if it has been computed by the manufacturers with proper allowance made for the fact that it is a combination furnace and not a hot air furnace, pure and simple. There's quite a difference between the two, so don't let it be found out at your expense.

Put the figures down on your estimate sheet; good big plain ones; also put down opposite them the amount of hot water radiation the furnace will carry. Work the problem out in such a way that you will not use a larger proportion of hot water radiation than hot air. If anything, favor the hot water side by using slightly less. Our experience does not recall to us a case in which this order of things had to be reversed.

Consider every foot of hot water piping as radiating surface and count it as such in your total.

All the features of regular hot water heating work in regard to proportioning of mains, grading the same, manner of connecting to radiators, covering of mains, &c., enter into this work.

To those who have done nothing of this kind as yet we would earnestly recommend that they work in conjunction with some fitter who understands good work and will take the responsibility of the piping off their shoulders. After they have carried this along for some time they may feel that they have learned enough to have some judgment and may essay to stand alone. Whether they can or not won't take them long to find out.

ODD PLATES.

We have received from C. W. Curtis of the Sill Stove Works, Rochester, N. Y., an interesting document which he found among the papers of his grandfather, who was a blacksmith. It bears date of August 24, 1834, and conveys to William Curtis of Clinton Township the right to use a composition controlled by a Mr. Freeman for working iron and steel and tempering edged tools. The formula is given and also directions for using the composition. The document consists of a piece of paper, measuring about 8 x 10 inches, and is partially printed and partially written. It is exceedingly primitive in its general make up and is in striking contrast to the legal documents of the present day.

The Wheeling Stove & Range Works is the name of a company recently incorporated at Wheeling, W. Va., with a capital stock of $100,000, for the purpose of manufacturing, buying, selling and dealing in Stoves, &c. The incorporators include W. E. Whitaker, Alexander Glass, G. C. Reppetto, A. C. Whitaker and N. P. Whitaker.

At a recent meeting of the stockholders of the Duffy-Trowbridge Stove Mfg. Company, held at Hannibal, Mo., directors were elected as follows: James Duffy, C. H. Trowbridge, C. A. Trowbridge, George W. Dulany and W. F. Chamberlain.

Charles C. Heath & Co., proprietors of the Ideal Stove Works, are distributing from their Philadelphia house, 136 and 138 North Second street, coupons bearing the suggestive title "Are You Riding Free?" These coupons are sent to customers and entitle the holder to a 1000-mile mileage book over any railroad in the United States issuing them when returned to the company's Philadelphia branch accompanied by 200 premium shipping tags. These tags the company attach to all Repair shipments made by them, whether large or small. This is a novel method of stimulating their Repair business, and on the face of it would appear to be well calculated to accomplish the purpose intended.

A little folder which is being sent out by the Champion Steel Range Company, 131-137 Viaduct, Cleveland, Ohio, has pasted upon the first page a small feather, above which is the inscription "This will tickle you" and below in smaller type the words "if you properly apply it." That which is intended to tickle is not so much the feather as the company's large and complete line of Hot Blast Steel Ranges, which they are offering under the names of Champion and Marquart. The company intimate that their travelling salesman will soon visit the town in which the dealer receiving the folder is located, and they ask him to reserve his orders until their representative calls and shows him the lines of Ranges mentioned. The Champion and Marquart are claimed by the company to be the only double flue Ranges which feed the fire with hot air and save one-third the fuel. The goods are offered in over 400 different styles and sizes, and are therefore adapted to meet all reasonable requirements.

The Chicago Furnace Supply Company, Chicago, have issued their initial catalogue giving illustrations and descriptive matter of the specialties which they manufacture. The plant of the company for the manufacture of Furnace Pipe. Adjustable Elbows, Stacks, Fittings, &c., is well equipped with modern machinery and is devoted exclusively to the manufacture of Furnace Supplies. Skilled mechanics are employed and the men associated with the enterprise have had long experience in this line of manufacture.

The Sifter Stove Polish Company have been organized at Saginaw, Mich., with a capital of $100,000.

The Chicago Stove Works, Chicago, Ill., have issued to the trade an illustrated leaflet setting forth the merits of their 1902 pattern Gold Coin Steel Ranges and Stoves. The company have placed on the market a new line of Gas Stoves under the name of Royal Gold Coin, these being made in three sizes and handsomely decorated.

Chas. C. Heath & Co. of Philadelphia, Pa., and Baltimore, Md., have now in operation at their Philadelphia branch store, 136-138 North Second street, a department for the manufacture of Stove and Furnace Heating Pipe, in which branch of the trade they propose being quite a factor. Henry Swartz, the manager of the branch house, advises us that the business done by them in Philadelphia has exceeded their best expectations. The demand for Gas Ranges, Oil Stoves and Ovens has been very large, and their only difficulty is in obtaining deliveries promptly on this class of goods. An excellent business continues to be done in Stove Repairs. Mr. Swartz is an active figure on the street, and wherever there is any business he is pretty sure to be around.

The Southard-Robertson Company of Water street and Peck slip, New York City, call the attention of the trade to their Magnetic Girard Range by means of a neat four-page folder printed in two colors, which they are sending out. The Range is made in six sizes for coal or wood, and has been redressed and greatly improved for this season. It is of substantial appearance and has an attractive exterior, a prominent feature of the decoration being a nickeled name plate on the oven door. The range is equipped with the modern improvements and can be furnished with either plain flat bottom grate or duplex grate, as preferred. Special linings with extended back are provided for burning wood as a fuel and cast plates for burning soft coal. All sizes are made with reservoir, the tank being of heavy copper lined with tin and easily removed for cleaning. Another circular which the company are sending out refers to the Magnetic X Ray, a substantial Range made with either five or six boiler holes and which is referred to as an entirely new construction. The cabinet base is entirely separate from the body of the Range, which has large oven, pedal door opener and nickel trimmings.

J. M. Litchfield, New York, is lending his assistance to the development of a foreign trade for Stoves. He has recently made shipments to China, South Africa, Jamaica and the Azores.

The United States Register Company, Limited, manufacturers of the Jones Side Wall Warm Air Register, Battle Creek, Mich., have experienced such an active trade that they have found it necessary to enlarge their works, but are now in a position to take care of the much increased volume of business. Their output at the present time amounts to 100 Registers per day. In a neat catalogue the company set forth the merits of the Jones Side Wall Register, which is provided with an adjustable deflecter, causing the air to enter the room from the Register at an angle of 45 degrees. The manufacturers guarantee the Side Wall Warm Air Register to do better work than Floor Registers where the furnace is properly set and the air supply correctly arranged.

The Monarch Stove & Mfg. Company, Mansfield, Ohio, advise us that they are in a position to give all orders prompt attention. Their facilities are much greater than heretofore, accordingly they are enabled to keep up with the demand in good shape, although at the present writing they are considerably ahead of last season as to sales. The Monarch line seems to be taking a very firm hold on the trade, the company's sales being 33 1-3 per cent. ahead of last year. They take this as pretty conclusive evidence that their products are satisfactory to their customers. The Monarch New Method, which is an evaporating Stove, and the Monarch Cabinet, known as their No. 122, have proved wonderfully successful custom bringers this season.

Rebates to the Retail Merchants.

An illustration of the manner in which a prominent manufacturing company are endeavoring to establish relations with the retail trade is given in a form of contract prepared by them and circulated by their travelers among the merchants. This contract, which is reproduced below, is, it will be observed, an agreement on the part of the merchant to purchase from the manufacturers direct all of the goods of their manufacture which he sells. As a reward for this, he is to receive a rebate of 5 per cent. at the end of the year. The form of agreement is as follows:

To the ——— Manufacturing Company:

In consideration of the sum of One Dollar ($1.00) to me in hand paid, receipt of which I hereby acknowledge and other considerations, I hereby agree to order all ——— ware which you sell exclusively from you from this date until December 31, 1902, at fair and reasonable prices, with the understanding that if I do purchase exclusively all such ——— ware from you during the said time, that on receipt of satisfactory proof to you by me of same, that on December 31, 1902, you will pay me an extra cash bonus or rebate (to be considered strictly confidential) of five per cent. (5%).

Yours very truly,

———————

Rochester Stamping Company.

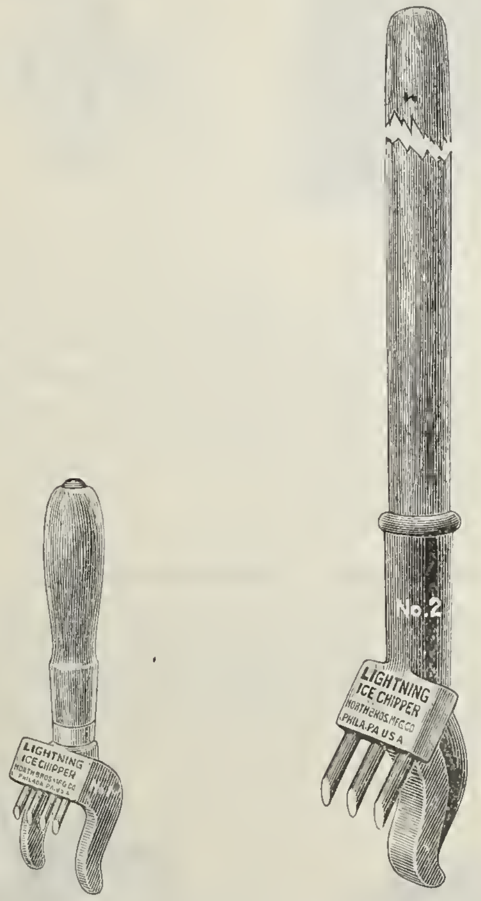
The Rochester Stamping Company, Rochester, N. Y., have increased their capital stock from $300,000 to $500,000, in order that they may to better advantage handle their rapidly growing business, which now covers the entire country, as well as considerable foreign ground, including German, English, French, Australian, South American and African clientage. The company are at present employing about 500 hands, with 44 salesmen on the road, and are running two factories full time. They have recently been obliged to equip a second factory and also build a new storage warehouse. All the capital stock is held by the original stockholders, none of it being offered outside. The company are looking for a very satisfactory trade this fall, as there seems to be a growing demand for the goods of which they make a specialty.

Landers, Frary & Clark's New Catalogue.

Landers, Frary & Clark, New Britain, Conn., and 82 Chambers street, New York, have just issued a very practical and convenient trade catalogue illustrating and describing the large and diversified line of goods which they manufacture. The book has flexible covers for quick reference, and is divided into two sections, there being 420 pages in all, each 9¾ x 6½ inches. The first 208 pages relate to fine table cutlery and butchers' tools. This section, with its own separate index, is designated as Catalogue No. 19. The second section, Catalogue No. 20, of 212 pages, treats of a large assortment of hardware articles, among which are the Universal food chopper and Universal meat chopper, stuffers, coffee, spice and drug mills, numerous kinds of house furnishing and kitchen utensils, scales, cocks, faucets, bibs, bright wire goods, &c. The catalogue will undoubtedly meet the cordial approval of the trade as presenting the important lines of goods to which it relates in a businesslike and convenient manner.

Lightning Ice Chipper.

North Bros. Mfg. Company, Philadelphia, Pa., are offering the ice chipper herewith illustrated, which is an improvement on their Crown chipper and designed to do more rapid and effectual work. The teeth are made of hardened and tempered steel pins having the ends beveled for cutting. The guard or guide is open to permit the chipped ice to escape freely. The chipper is made in two styles, as shown in Fig. 1, No. 1 for family use and No. 2, with a handle 48 inches long, for confectioners, hotels, restaurants, &c., where considerable quantities of chipped ice are used. In Fig. 2 the chipper is shown in use.



LIGHTNING ICE CHIPPER NORTH BROS. MFG. CO. PHILA. PA.

LIGHTNING ICE CHIPPER NORTH BROS. MFG. CO. PHILA. PA. U.S.A.

Fig. 2.—Lightning Ice Chipper in Use.

The Sun Dinner Pail Ear.

W. B. Bertels, Sons & Co., Wilkes-Barre, Pa., manufacturers of Sun dinner pails, one of which is shown in Fig. 1, have recently brought out a new ear, as shown in Fig. 2. The body of the ear is made of heavy sheet steel and tinned, and the spring of heavy spring brass. The manufacturers state that they have used different styles of ears in the past, but find this one the best of their production. Regarding the pails, we are advised that the latest improved machinery is used in their manufacture and that there is no hand work done on any pail except the soldering.

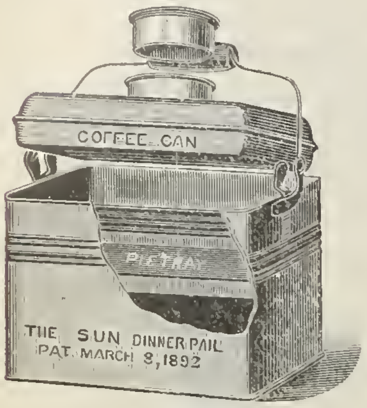

Fig. 1.—Sun Dinner Pail.

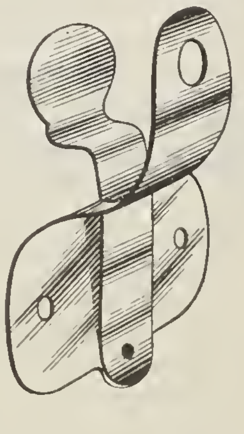

Fig. 2.—Spring Ear.

The Pelouze Coffee Percolator.

The Pelouze Scale & Mfg. Company, 118-132 West Jackson Boulevard, Chicago, Ill., are bringing out the coffee percolator shown herewith. It is designed for use in any coffee pot, and is referred to by the manufacturers as making coffee richer, stronger, purer, more healthful and delicious in flavor than other coffee making devices. As results from its use it is stated that there is no discoloration of coffee, no bitter taste, no grounds and no sediment.

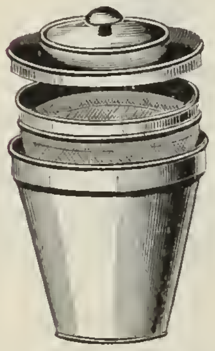

Fig. 1.—The Pelouze Coffee Percolator.

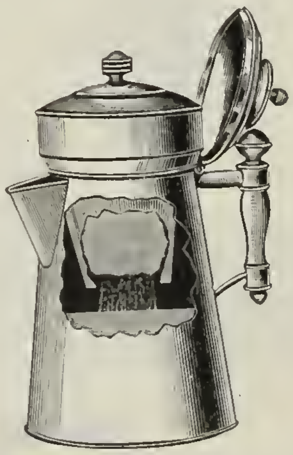

Fig. 2.—Pelouze Percolator in Coffee Pot.

Clark & James, 122 Water street, Cleveland, Ohio, are manufacturing Glasbrite, a chemical composition for cleaning windows, arc and incandescent lamps, mirrors, cutlery, silver, brass, &c. The composition is put up in cakes, and is applied with a damp sponge or cloth and polished with a dry cloth. It so thoroughly polishes glass, it is explained, that dirt and dust do not adhere readily, and that when they do they can be wiped from the glass with a dry cloth. It is remarked that the composition contains no grit or acid, that it simply cuts the dirt and that being a chemical it will not scratch the finest glass.

Wm. Parkinson, Madison, Neb., has disposed of his business to the Hume-Robertson-Wycoff Company, who will continue the wholesale and retail Hardware, Stove, Tinware, House Furnishing Goods, Glassware and Plumbing and Heating business at the old stand.

Stove and Hardware Dealers.

Wm. S. Long has recently engaged in business in Marquette, Neb., handling Hardware, Stoves, Tinware, Sporting Goods, Furniture, &c.

Barnett & Lipe, dealers in Shelf Hardware, Stoves and Tinware, El Dorado, Texas, have been succeeded by Y. F. Barnett.

W. M. Black Mercantile Company have opened up in business in Garber, O. T., handling Shelf Hardware, Tinware, Stoves, Sporting Goods, Groceries, &c.

D. B. Ashbrook of McFall, Mo., has opened a branch store at Carrollton, where he is carrying a stock embracing Hardware, Stoves, Sporting Goods, &c.

E. G. Sjovall has sold his Hardware, Stove and Tinware business in Stormsburg, Neb., to Carlson & Olson.

The New Mexico Hardware & Furniture Company, Tucumcari, N. M., have been succeeded by the New Mexico Mercantile Company, a stock company organized under the laws of New Mexico. The officers of the new concern are as follows: C. H. Rankin, president; J. I. Lamb, vice-president; I. C. Barnes, treasurer, and L. D. Allred, secretary. The company handle Hardware, Stoves, Tinware, Glassware, Lumber, Crockery, Furniture, &c.

Hendricks & Nehr have sold their wholesale and retail Shelf Hardware, Stove, Tinware, Buggy and Wagon business, at Guthrie, O. T., to the Stumpff Hardware Company.

Atlas Tack Company, George W. Weymouth, president and manager, announce under date June 1, that they are now installed in their new mill at Fairhaven, Mass., and are fully equipped with the latest and most improved machinery in every department. It is further stated that as the Taunton office has been discontinued, all correspondence of whatever nature should be sent to the new address, Fairhaven, Mass.

A. Ammundson has purchased the Hardware, Stove and Farm Implement business formerly conducted by Turek & Dvorak in Wagner, S. D.

Clinton Wire Cloth Company, who recently abandoned their headquarters in Beekman street, where they have been for a long term of years, are now thoroughly settled in their new quarters, 33 Park place, New York. Their new premises have been thoroughly renovated, and they now occupy the street floor, basement and subbasement. They have commodious bins for storing stock and large drawers conveniently located to receive Brass, Bronze and Copper Wire Cloth, manufactured by them. They are also well equipped with power elevator, electric lights and other modern conveniences, with well appointed offices on the main floor.

P. A. Myers, junior member of the firm of F. E. Myers & Bro., Ashland, Ohio, will take a well earned vacation this summer and will devote it to making an extended tour of Europe. In his travels he will visit the agencies which have built up the company's extensive business abroad and will study trade conditions with a view to further extensions. He sails June 14 on the "Etruria," arriving in London in time to witness the cononation of Edward VII. The trip will include England, Holland, Belgium, Germany, Switzerland and France. Mr. Myers expects to return on the "Umbria," August 16.

The American Utensil Company, Baltimore Md., are issuing a circular illustrating the Beveridge Sanitary Cooker. These utensils are made in different sizes, in tin, polished copper and enameled ware.

Mayor Rose of Milwaukee, Wis., has found it necessary to make a decision relative to the technical meaning of the term "organized labor." This term is frequently used in city contracts. The Mayor has decided that this term cannot be considered to mean organized bodies of men who are not recognized by the national or international unions. The particular case which called out this decision was one in which a contractor at a new school building, now in process of erection, employed men belonging to an independent union.

The Reich Granite Ware Company, Cleveland, Ohio, are distributing a catalogue illustrating their high grade white lined Enameled Steel Ware, which is produced in all colors. The company also offer blue recoated seconds and gray seconds in this ware.

The United Electric Heating Company, Detroit, Mich., are issuing a folder devoted to their electrically heated Sad Irons. The circular shows the Irons in all styles, shapes and weights. It is explained that they will operate on any electric light or power circuit, direct or alternating.

The Pike Mfg. Company, Pike Station, N. H., and New York, have issued a booklet treating of Oil Stones, their selection, use and care. The purpose of the booklet as set forth in the introduction is to disseminate a better knowledge of Oil Stones among tool dealers and users. It is remarked that while the Oil Stone line is not a large item in the stock of any hardware house, yet it is a very important one, inasmuch as the successful use of all edge tools depends very largely upon proper sharpening. The company are supplying these booklets in any desired quantity, free of charge, to all dealers, whether customers of theirs or not.

Letters from the Trade.

Damage to Freight in Transportation.

We have received from a large house doing a jobbing business in one of the Eastern cities the following communication upon a topic of close interest to many of our readers:

In these times of progress, when we hear and read so much of great consolidations of railroad interests, as well as of the large earnings of railroads and declarations of dividends from the earnings, it might seem to be in keeping with good methods if the proper departments of the railroads were requested to instruct their loaders of freight to give more attention to the handling of the same in both local and carload lots. We are certainly in a sorry plight to-day in this respect. While being compelled to submit to the slow delivery by the railroad companies, apparently on account of lack of cars, we are also forced to permit them to handle our goods in such a careless manner as they oftentimes do. Take, for instance, some of the goods handled by most of the trades in which your readers are interested. How many times are galvanized and black sheets damaged in transit, owing to fish brine or other liquids leaking from packages set on the sheets? Then see the number of stoves and stove castings that are broken in transit through careless handling. In how many instances cases and barrels are pilfered of a portion of their contents. Tin plate, too, is thrown about so carelessly that, heavy as it is and well packed, the boxing is often broken to such an extent that the sheets are strewn over the railroad platform. Furthermore, it often happens that after goods have been damaged by careless handling, the freight having been paid, it takes anywhere from one month to one year to get a comparatively small claim settled—if it is ever settled at all. There should be some remedy for this trouble. No doubt if some of the associations in the different lines of trade would persistently urge the matter of more careful handling of goods upon the proper railroad officials the merchants might get the proper service for which they pay.

The Advantage of Consolidation.

In view of the fact that many manufacturers look with more or less question upon the desirability of consolidation, even in manufacturing lines, the following communication from a Massachusetts manufacturer will be of interest. It will be observed that he points out the considerations which in his judgment show the advantage of consolidation when wisely effected:

My impression is that consolidation of manufacturers of a certain class of goods if properly managed cannot be otherwise than profitable, first, to the manufacturers; second, to the workmen, and, third, to the purchasers.

The increased profits to the manufacturers will come from the benefit of buying largely, paying promptly, reduced freight bills, decreased selling expenses by traveling salesmen and the elimination of competition. The workmen will benefit by the prosperity of the manufacturers in increased pay and steady work. The purchaser's benefit will come from being able to buy at a stable price and figuring his profits confidently on that price. Price cutting and irregular market make purchasers more conservative in buying, because if they buy at a certain price to-day and some one else comes along and offers the same goods at a lower figure the purchaser feels that he has made a loss on his first purchase, so he is more careful to buy only for his immediate wants. In fact, some large buyers say that they have no objection to the price of goods offered if they only know that they have them at the lowest price, and not have some other manufacturer offer them at a less price when next his salesman calls.

The Cooper Union.

At the annual commencement exercises of Cooper Union, New York, on May 31, Abram S. Hewitt, secretary of the Board of Trustees, announced several new gifts to the institution and stated that hereafter the entire building would be used for the advancement of knowledge. Mr. Hewitt made a most interesting address on this occasion, in which he stated that the endowment of the institution, which last year was $958,000, had reached a grand total of $2,133,159. The great increase during the year came partly from Andrew Carnegie and partly from the Cooper family. Mr. Carnegie gave $600,000 and the Cooper family an equal amount, while a gift of $250,000 was made to the institution by one whose name has not been made public. Mr. Hewitt took great pleasure in making this announcement, stating that for 43 years he had annually presented the report of the Board of Trustees on such occasions, and had usually been obliged to state that the income of the institution was inadequate, and for the greater part of those 43 years the appeal he made seemed to fall on deaf ears. He had not expected to live to see the great object accomplished of freeing the building from secular uses and turning it over entirely to educational work. Prizes and diplomas were awarded to a large number of graduates, including students who had taken courses in the night schools in science, in qualitative and quantitative chemical analysis, and in the night school of art.

Strike Injunction Decision at Chicago.

The Appellate Court of Illinois has affirmed in every particular the injunctional order granted by Judge Chetlain last January restraining John Beaton and other members of the International Association of Machinists from in any manner unlawfully interfering with the business of Robert Tarrant, machinery manufacturer at 52 Illinois street.

The decision was the outcome of litigation involving the strike at the plant of the Allis-Chalmers Company a year ago. Mr. Tarrant took contracts from that company, and on August 3 of last year the union machinists in his employ struck. Mr. Tarrant set up in his bill for an injunction many specific acts alleged to have been done by the striking machinists to the financial injury of his business. Numerous affidavits also were filed by men who asserted that they had been threatened and intimidated by the strikers. The Appellate Court adopts Judge Chetlain's conclusions of law in regard to the case, which in part are as follows:

"Workmen may use the streets and highways in a manner not inconsistent with public travel for the purpose of entreaty, inducement and peaceable persuasion in good faith, and a patrol picket may not necessarily imply force or a threat of bodily harm; but to accomplish their purpose they must not overstep the bounds and use threats, abusive epithets or intimidation, or congregate in such number or in such manner or with such a show of force as is calculated to intimidate a reasonable and prudent man, and no harm can result in granting an injunction to restrain such unlawful conduct."

E. A. Buck & Co., Palmer, Mass., have bought C. W. Taylor's Hardware stock in Exeter, N. H., and have engaged C. W. Robinson to manage the business at that point. The stock comprises Shelf and Heavy Hardware, Stoves and Tinware, Agricultural Implements, Crockery, Sporting Goods, Wooden Ware, &c.

PLUMBING TRADE CONFERENCE ASSURED.

The probability of a conference in the plumbing trade, foreshadowed in *The Metal Worker* of last week, has now become an assured fact, and arrangements have been completed for a meeting between the officers and Executive Committee of the National Association of Master Plumbers and of the National Committee of the Confederated Supply Associations. This meeting will be held in Atlantic City on June 13. A year ago both of these bodies were working under the New York Conference Resolutions, which were the result of a conference held in New York City between the same two bodies. During the year, however, these resolutions were found to be unsatisfactory, and at the present time the plumbers are working under what is known as the Cleveland Resolutions, while the supply trade are operating under the resolutions adopted at Chicago. These different sets of resolutions vary in some important points, and the provisions for arbitration and conciliation of differences are omitted. It is hoped that the deliberations at Atlantic City will result in a mutually satisfactory agreement. That there is some probability of such a result is indicated by the smoothness with which this branch of trade has been conducted, notwithstanding the difference in the provisions of the resolutions governing the two interests engaged in it.

MANUFACTURERS' AND JOBBERS' MEETING.

A year ago the Association of Manufacturers and Jobbers of Plumbing Supplies of the East met with the Central Supply Association at Detroit. This year the Central Supply Association had practically completed arrangements to hold their summer meeting at Put-In-Bay. This association, however, courteously changed their arrangements and will convene with the Association of Manufacturers and Jobbers of Plumbing Supplies in a joint meeting to be held at the Cataract House, Niagara Falls, N. Y., on June 24.

At the Detroit meeting, E. D. Hornbrook, the newly elected president of the National Association of Master Plumbers, was invited to be present in his official capacity, and it may be expected that the newly elected president of this body will again be the guest of the manufacturers and jobbers. As the results of the deliberations of the conference at Atlantic City and of the convention of the National Association of Master Plumbers will be known at the time this body meets, opportunity will be afforded to take suitable action in reference to them. The conservative element in both branches of the trade will be well pleased if, at the conclusion of these meetings, the differences which have existed during the year will have been removed.

PROGRAMME OF FIFTH SEMIANNUAL MEETING OF THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS.

Hotel Rudolf, Atlantic City, N. J., Monday, June 16:

Morning Session, 10 o'clock.

Roll Call.

President's Address.

Paper, "Cooling an Auditorium by the Use of Ice," by John J. Harris.

Discussion.

Topical Discussion.

Afternoon Session, 2 o'clock.

Paper, "A Time Limit and Dry Walls Necessary in Testing a Heating Plant," by John Gormly.

Discussion.

Topical Discussion.

Evening Session, 8 o'clock.

Paper, "A Test of a Fan Blower With Cast Iron Radiating Surface," by Prof. R. C. Carpenter.

Discussion.

Reading of Papers.

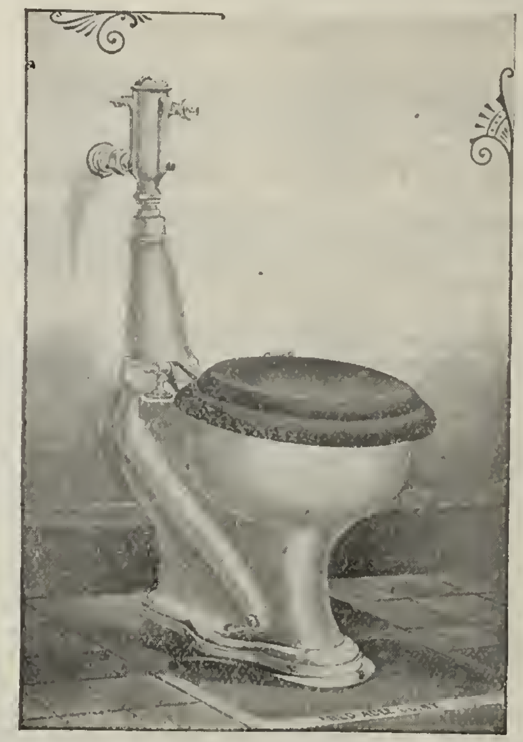
Discussion.

Topical Discussion.

A New Closet and Valve.

In comparison with the water closet of a decade ago the modern water closet is as much more efficient in service as it is more attractive in appearance. The latest productions in this line present also further important improvements in construction and operation. Fred. Adee & Co., 90 Beekman street, New York, have applied for a patent on the Zenith flushing valve, shown in connection with the Cygnet water closet in the accompanying illustration. This closet is adapted for the use of the valve shown or may be flushed with the ordinary tank provided with siphon jet closets. The Zenith valve is especially suitable for use in connection with a number of water closets in an office building, its construction enabling it to operate satisfactorily under the varying pressures afforded on different floors. The mechanism of the valve is very simple, and consequently it is not likely to get out of order. It opens by means of a push lever and closes with the pressure, so that it is absolutely tight, and, furthermore, is noiseless in operation.

The Cygnet closet, shown in connection with the valve, is of the regular approved siphon jet type. At the base of the channel to the jet there is a drain plug, so that when the closet is placed in a building which is unoccupied in winter all of the water that it contains may be drawn off to make it perfectly safe against damage from freezing. The most important feature of the closet is the flushing horn at the back to which the valve is connected. Inside of this extension, which is about 10 inches high, and directly below the inlet from the valve, is a brass tube connected directly with the channel to the jet, which operates when the valve is open. The first rush of water is down this pipe to the jet. After this channel is filled with water the overflow from the pipe passes to the flushing rim. The effect of this construction is to induce a suction of air from the bowl to the closet through the openings in the flushing rim and also to drive the air in the upper leg of the trap before the jet. The effect of the jet is to dispose of the solid matter that may be in the bowl before it is subject to agitation or churned, which is to a greater or less extent inevitable in all siphon jet closets. The slight period of time after the jet is started to work before water appears in the flushing rim allows the air in the bowl of the closet to be drawn away, very much after the manner in which a local or seat vent operates. In operation the jet starts a strong siphonic action and the flushing rim secures a thorough scouring of all the surface presented in the bowl. At rest the bowl is occupied by a good surface of water and is protected by an ample water seal. The bowl is constructed of vitreous china in one piece. The closet is well worthy of careful examination, and they have met with the approval of a number of plumbers who have purchased and installed them.



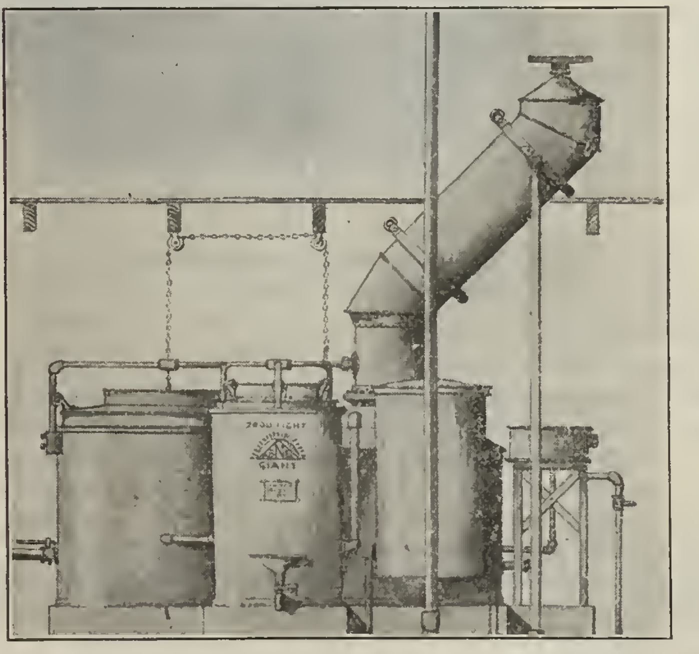
A New Closet and Valve.

Town Lighting Acetylene Plants.

Since the production of calcium carbide has been made practicable at a cost low enough to permit its use for the production of acetylene gas, this method of illumination has increased in popularity as its capability of meeting varied requirements has become known. Owing to the strong illuminating power and the pleasing light resulting from the burning of this gas, its use has been popular not only in bicycle and house reading lamps, but also when produced in larger generators for illuminating residences, as well as for illuminating summer hotels and their surrounding buildings. Having shown its adaptability for this purpose, it was only a short step to the illumination of villages and small towns, and even of quite large centers of population.

The Abner Acetylene Gas Company, 32-36 La Salle street, Chicago, Ill., have not only been successful in the production of house lighting plants, but have now issued a special catalogue devoted to their apparatus suitable for municipal use. In the accompanying illustration a view of one of their 2000-light acetylene gas generators is presented. Plants of this character are designed to be installed in the basement of a building, and by means of a hopper extending upward, as shown in the cut, they receive the charge of carbide from the upper floor of the building. This apparatus is capable of receiving a charge of 2000 pounds. These plants were designed with a view of compactness in size, so that a small building can be erected at low cost which will contain the entire apparatus.

Another feature is the automatic production of the gas, whereby fresh gas is supplied to the mains continuously and no disadvantage is experienced from deteriorated gas that has stood for some time. The automatic feeding of the carbide prevents the escape of gas when recharging the generators, and, as the feed is measured, when enough is thrown into the generator to generate the quantity of gas that is needed to raise the bell no more gas can be produced until the quantity made is consumed. This apparatus is also automatically supplied with water, keeping down the temperature and insuring the full capacity of the carbide in a gas generator.

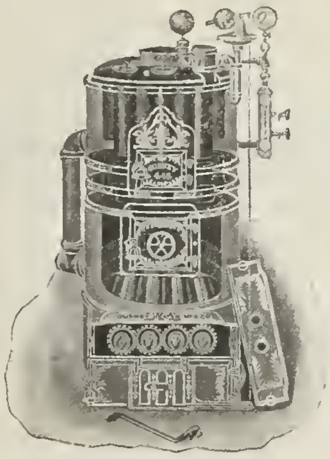


Town Lighting Acetylene Plants.

Naturally, where so large an amount of carbide is used as in a municipal lighting plant, the residuum must be cared for or the capacity of the generating chamber will be reduced. In this apparatus the residuum is discharged each time the bell rises. A feature of the apparatus is two scrub or water cleaning chambers and two filters or dry cleaners, by means of which the gas which reaches the distributing mains has been freed from all matter that is liable to cause annoyance. It is claimed that so little attention is required for a 2000-light plant that a man who cares for it can also look after the entire business of the plant—making out and collecting bills, reading the meters and such other emergency work as may be necessary. The company have issued a special pamphlet giving full particulars and drawings for the installation of town lighting systems.

The Gurney 400 Series Steam Boiler.

In the accompanying illustration is given a transparent view of the Gurney 400 Series steam boiler, made by the Gurney Heater Mfg. Company, Boston, Mass.



The Gurney 400 Series Steam Boiler.

The sections above the fire contain a number of flues to allow the products of combustion to find their way to the chimney, and at the same time to enable their greatest heat to be utilized for heating the water lying upon the other side of the surfaces with which they come in contact. The boilers are provided with a grate, rendering the care of the fire free from labor, and are equipped with the usual automatic draft regulating features. The boilers are made in ten different sizes, with grates from 17 to 35 inches in diameter, and are rated to carry from 300 to 2200 square feet of direct hot water radiation. The steam boiler is made in eight sizes, rated to carry from 250 to 1225 square feet of direct radiation.

Approved Plumbing Fixtures.

E. S. Wheeler & Co., New Haven, Conn., have recently issued Catalogue D, devoted to approved plumbing fixtures. The catalogue is 9½ x 12 inches in size, bound in green cloth covers, and has 170 pages, including a well arranged index. The introduction states that the present publication contains plumbing fixtures which have met the approval of experienced and practical men. The first illustrations presented are of bathrooms equipped with the most modern plumbing fixtures, which are followed by several pages showing the Wooster solid white porcelain Roman and French pattern bathtubs. The next section of the catalogue is devoted to white enameled iron sitz and foot baths and a varied line of wide and narrow roll rim and flat rim enameled iron bathtubs. These are followed by a variety of supply and waste fixtures, shower baths and shampoo fixtures. Solid porcelain, fine marble and white enameled iron lavatories are next shown in great variety. Another section of the catalogue is occupied by fine water closets, one page being devoted to the Universal direct flush controlling valve.

Plumbers' wood work, flush tank valves, seats and nickel plated flush and supply pipes form another section of the catalogue. The next 30 pages are devoted to pantry sinks, kitchen sinks of white porcelain ware, slate, copper and enameled iron and slop sinks, followed by a variety of laundry trays. Urinals and urinal stalls, range boilers, plumbers' marble, lavatory bowls, lavatory fittings and fixtures, brass traps, nickel plated supply and waste fixtures, basin cocks, compression bibbs and a varied line of plumbers' brass work for kitchen and bathroom equipment occupy the closing pages.

LEIGHTON BROS., Fort Dodge, Iowa, agents for the New York Central Iron Works Company of Geneva, N. Y., are pushing the sales of the Dunning Boilers and Tanks throughout the State of Iowa.

SUBSTITUTE FOR SOIL.

BY D. F. N.

It is probable that not every plumber knows of a substitute for plumbers' soil which has been found far superior in doing its work. It is common shoe blacking. How many times when the lead worker has been doing a nice piece of work he began to kick and jaw with the helper when the soil started to peel off from having a little too much glue in its makeup, or sometimes a little less than was necessary. Some of the most clever mechanics use paste only. Now and then, on a pinch, a fellow will split a raw potato and rub it up and down on the portion of the work to be protected to cause it to tarnish so that it would not tin. In my opinion there is nothing found as yet that does the work of common shoe blacking. This, of course, is not kept in stock at the shop: because if it was I suppose it would fill more than one purpose, particularly if the box was made in the usual shape. If the shoe blacking was put in cylinders having a small opening, provided with a common screw cap, into which a brush could be inserted, it would be easy enough to handle and would carry readily in the kit. If you have never tried shoe blacking on your lead work, carry a box in your kit and give it a trial.

Heating from Street Mains.

At the recent Cincinnati meeting of the National Electric Light Association the utilization of the exhaust from power stations for heating buildings was discussed. J. F. Porter and P. H. Korst referred to their experiences with systems of heating by the circulation of hot water instead of direct distribution of exhaust steam. With direct heating by turning exhaust steam into the pipe system there is necessarily considerable back pressure upon the engines. By forced circulation of condensing water through the heating system the engines may be run condensing. In extremely cold weather the back pressure may be advantageously increased during periods of the day when the load on the engines is light to elevate the temperature of the water. This method is particularly applicable to electric lighting stations.

The Page Company, 114 Main street, Norwich, Conn., inform us that they have recently increased their capital stock and are now prepared to double the output of their New Era Steam and Hot Water Heaters. They are also about to bring out what they claim to be the best Sectional Boiler ever produced. The company's plant has recently been equipped with a 10 horse-power gasoline engine. They are sending to the trade a catalogue of the New Era Boilers and the Page Radiator Holder.

The Richmond Magazine Boiler.

A boiler of the vertical sectional type that is suitable for use as a magazine feed boiler, and also possesses excellent features as a surface burning boiler, is somewhat of a novelty to those engaged in the steam and hot water heating business. The Richmond Stove Company of Norwich, Conn., have brought out this year a boiler of this type. In Fig. 1 a broken view is presented showing the magazine, the fire, the combustion chamber, the flues and the fire travel. The view given in Fig. 2 shows the grate arrangement, which is of the labor saving type and calculated to keep a bright fire in all parts of the surface. This view also shows the arrangement of the fire surface and the flue surface. This boiler is recommended where the owner desires to minimize the consumption of fuel and the attention necessary to maintain a steady fire, and where uniform heat is needed throughout the night as well as the day. It is claimed that the magazine will hold enough fuel to maintain a fire from 36 to 48 hours without choking the fire to any serious extent, and that active combustion will be preserved continuously at the sides, where it is most effective and in direct contact with the water legs and fire surface. It is also pointed out that the contractor will find satisfaction in the fact that the boilers are assembled by means of manifolds and lock nut nipples. The water sections rest on a base made up of sections provided with sockets for supporting the grate. The cuts show doors arranged for cleaning the fire and flue surface. At the rear are similar doors adapted for cleaning the boiler and also for use as check drafts.

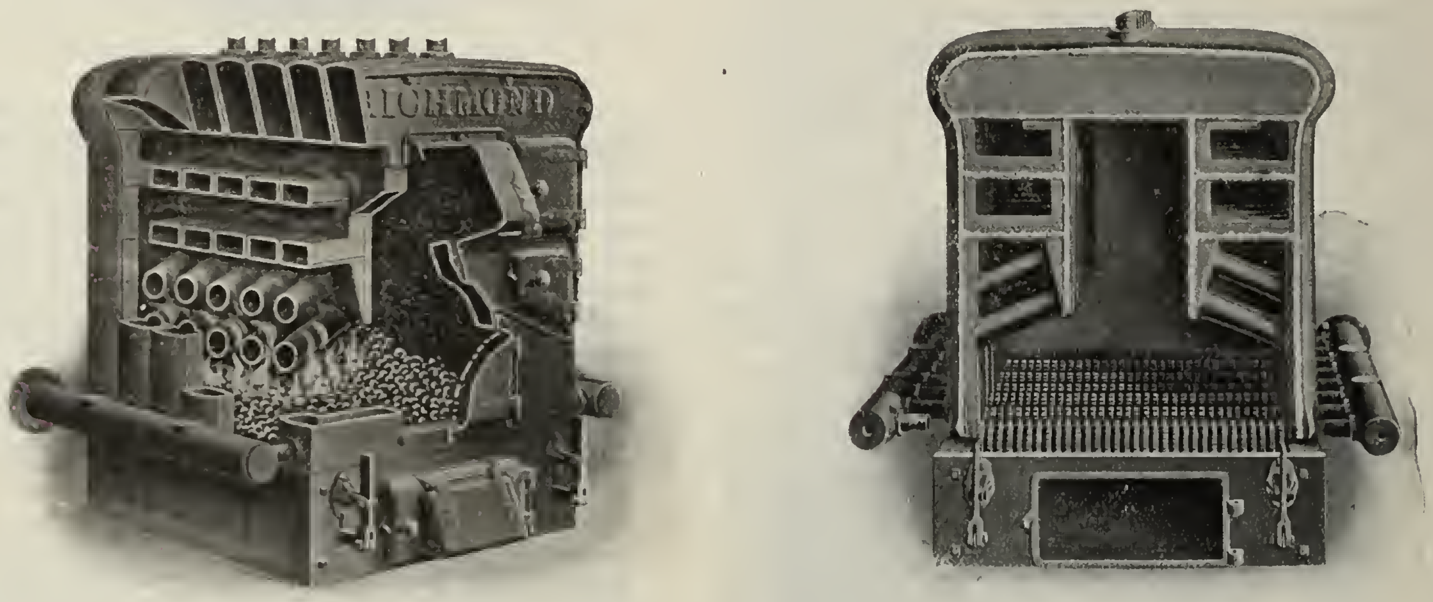


Fig. 1.—Broken View.

Fig. 2.—Interior View.

The Richmond Magazine Boiler.

Another feature of the boiler is the use of bridge wall sections, so that the size of the fire chamber may be reduced to the requirements of the season. The top header of the steam boiler is connected with the sections by means of long nipples which extend up into the steam drum, so that condensation in this drum is not carried off with the steam to the heating mains, but is carried down to the return by means of a special pipe connection at the rear of the heater, which connects at the back with the return headers on each side of the boiler. These boilers are made in nine different sizes, composed of from 4 to 12 sections, having grates 30 inches wide and from 18 to 66 inches long. They are rated to carry from 600 to 1800 square feet of direct steam surface and from 1000 to 3000 square feet of direct hot water surface. The extreme hight of the boilers is 70 inches and the extreme width 56 inches, the water line being 49 inches above the floor. The company have recently issued an especially fine catalogue giving full explanation of the various details and a variety of views and diagrams, so that the construction of the boiler can be readily understood.

SETTING LAVATORY BOWLS.

BY HELMAR.

Solid porcelain and enameled iron lavatories cast in one piece have found favor with the public, but the work of "setting" bowls is none the less important, and correct work is even more highly appreciated now than formerly. Much of the marble work carried in stock is indifferently cut and fitted, but slabs made to order give the plumber a chance to use his skill when specifying. All bowls should have the face which joins the slab ground so as to bring the whole face in one plane. This keeps the bowl from rocking on the slab, insures a close, neat joint, and the grinding takes the pottery glaze off so that the plaster will adhere.

Bowls should not be set and left where they will get freezing cold. The ground face should be well soaked with water before setting. If this is not done the porous face will take the water out of the plaster so quickly that it cannot be moved without ruining the joint, and it will be difficult to put the bowl down exactly right, even with the guide line and points previously marked on both slab and bowl to work by.

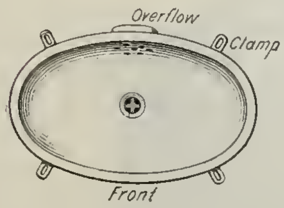

Fig. 1.—Oval Bowl.

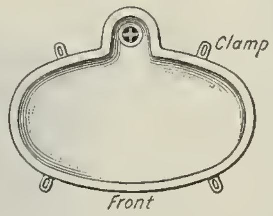

Fig. 2.—Recessed Bowl.

Setting Lavatory Bowls.

The grade of plaster used by dentists is best; less of it is needed; it adheres better and looks better when finished. It should be mixed to the consistency of cream, poured around the bowl hole inside the guide line and the bowl set carefully on it and pushed down and jostled into place quickly. The basin clamps should be screwed down while the plaster is soft and the inside and outside wiped clean. If the slab and bowl fit well a joint 1-16 inch thick is ample, and no overhanging plaster on either side is necessary.

Guide lines are made by the marble cutter by scratching around the bowl while it is held properly over the bowl hole. On stock slabs the plumber can make the guide line with a pencil. Any marble works will grind bowls for stock slabs very cheaply.

The plumber must determine whether the overflow shall be placed in front or back. When set at the back it looks bad, but is always in evidence and suggests cleaning when necessary. The overflow channel is sometimes in the way of the apron if placed at the front on apron lavatories. If placed at the side it may interfere with a bracket. The exact position of the overflow should be determined and marked with bowl in place before mixing the plaster.

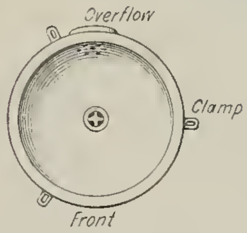

Fig. 3.—Round Bowl.

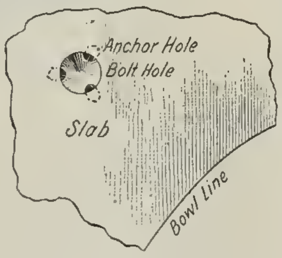

Fig. 4.—Drilled Slab.

Many kinds of basin clamps are sold. The usual type is cast or stamped with offset to reach over the flange of the bowl and slotted for the bolt. The bolt has a thin, flat square head. It is made of brass. Four clamps should be used on square bowls, and the oval and recessed bowls, shown in Figs. 1 and 2. Three clamps are sufficient for a round bowl, as shown in Fig. 3. In every case they should be placed so as not to come in the way of overflow, brackets, recess or apron.

On stock slabs, if the holes are not in the right position, new ones should be drilled. Holes for clamp bolts are usually poorly drilled on stock marble and the anchor holes need to be drilled deeper. Three anchor holes, as shown in Fig. 4, drilled at an angle of 45 degrees, as indicated by Fig. 5, will keep the bolt in place if the lead is poured hot and carefully calked, as in Fig. 6, which also shows the clamp holding the bowl in place.

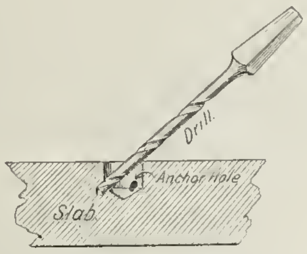

Fig. 5.—Angle of Anchor Holes.

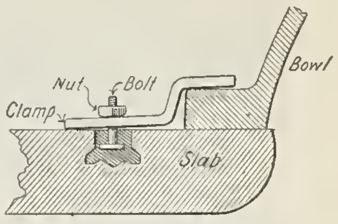

Fig. 6.—Calked Bolt and Clamp Attached.

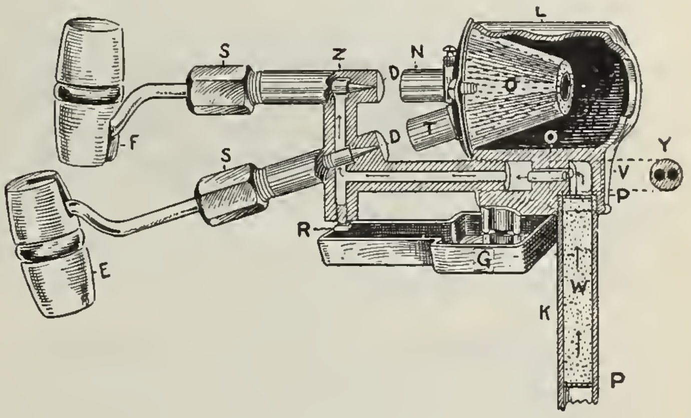
The Turner Double Jet Gasoline Burner.

The Turner Brass Works, 44 Franklin street, Chicago, Ill., manufacturers of gasoline double jet burners, torches, blow pipes, band saw brazing outfits, brazing forges, &c., explain that the double jet gasoline burner herewith illustrated introduces an important improvement in gasoline blow torches. In this torch the gas and air are controlled independently, instead of by a single jet, the gas being controlled by one valve and the air blast by another. This two-valve control enables the operator, it is explained, to produce a flame of any desired size, from a small concentrated pointed flame to a large powerful one, and at the same time a most intense heat is maintained through all adjustments. In the cut the lower burner valve E is the gas valve and the upper burner F controls the air blast, thus combining the air and gas in a novel way, which principle is claimed to be an advance in high heat production. The double jet burner is referred to as giving perfect combustion and as not only generating the most heat, but as being the most economical of fuel.



The Turner Double Jet Gasoline Burner.

Gravity Cooling Machine.

As the hot weather season is indicating its presence, additional interest will be attracted to the invention by Prof. Willis L. Moore, chief of the United States Weather Bureau, Washington, D. C., of an apparatus for cooling dwellings. It is said that the machine resembles a stove, so that the cost of cooling a given amount of space is approximately the same as that for heating the same amount of space by a stove or furnace. The invention, for which patents are being taken out, is designed for cooling dwellings and hospitals. It is claimed that in addition to reducing the temperature it washes and cleanses the air and renders it dry and healthful. Should Professor Moore's device prove successful in operation, there can be no doubt that it has a wide field of usefulness before it.

School Heating in Philadelphia.

The Board of Education of Philadelphia, Pa., a few months ago, instructed John D. Cassel, Inspector of Heaters, to make a thorough examination of the heating apparatus in each school, with the following result: The furnaces to which he called attention were installed prior to 1890, and he said:

> In most of the buildings heated with hot air furnaces there is an ever present danger from fire, owing to the heater flues and heat pipes being set too close to the joists and floors. Wooden air ducts to the heaters and the use of wood wainscoting around heat breasts, with valved or winged registers set in same in narrow slat margins, and contracted or small heat flues, also constitute a source of danger from fire.

The inspector also furnished the following statistics: Number of schools fitted with the blower system, 34; with the gravity system, low pressure boilers and indirect and direct radiators, 56; with the gravity system, low pressure boilers and direct radiators only, 9; with a combination of steam boilers and hot air furnaces, 11; with hot air furnaces only, 130; with a combination of hot air furnaces and stoves, 3; with stoves only, 12; number of steam boilers of various types, 195; of brick set hot air furnaces, 515; portable heaters, 114; stoves, 134.

The National Association of Master Plumbers of Great Britain and Ireland.

The annual meeting of the National Association of Master Plumbers of Great Britain and Ireland was held at the Holborn Restaurant in London on May 21. The meeting was called to order by the president, W. L. Harrison, with about 80 representatives of the trades present. The reports of the officers showed the association to be in a flourishing condition. The principal discussion at the meeting was in reference to trade protection. After selecting Huddersfield for holding the next meeting of the Central Board in August, and Leicester for the next half yearly meeting of the association, in November, President Harrison was re-elected for another term. Some amusement was caused by the remark of the secretary that the members who were most ready to bring charges of irregularity against manufacturers were precisely the same members who were least ready to pay their subscriptions to the association.

The Aurora Acetylene Company.

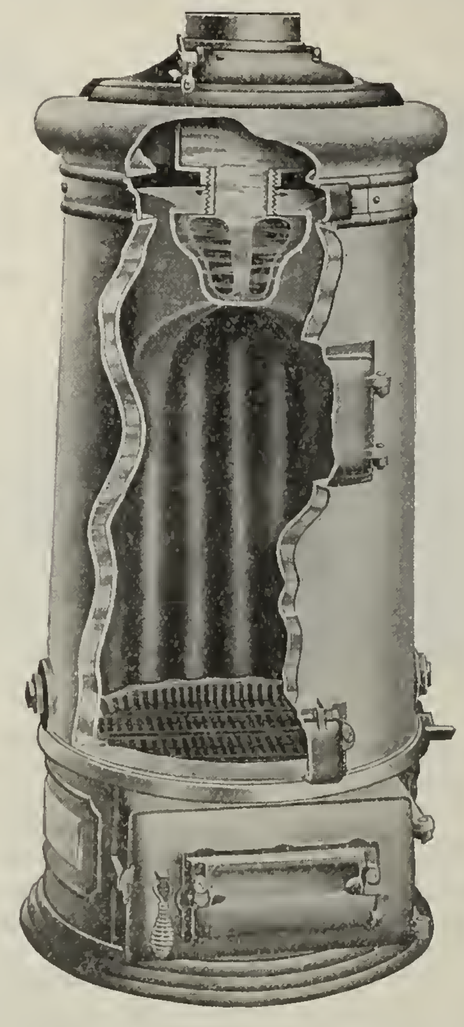
Harris & Partridge, formerly of Jacksonville, Fla., on account of the growing demand for their Aurora carbide feed acetylene generators, have reorganized their business into the Aurora Acetylene Company, and changed their place of manufacture to Chattanooga, Tenn. The generators are designed for lighting plants for cities, factories, churches, hotels, residences, stores, schools, mills, &c. A feature of the company's generator is that it feeds small quantities of carbide into a large body of water. It is pointed out that gas is only made as it is used; that there is no waste and no after generation. The company guarantee the material and workmanship in the machine, the amount and quality of gas, and the cleanliness of pipes and burners. They were given the highest award and gold medal at the Charleston Exposition.

Devotion to a Shop Mate.

A short time ago a 15-year-old boy named Otto Bosel, in the employ of the L. Wolff Mfg. Company, was sadly burned by the explosion of a zinc galvanizing tank in their Chicago plant. When the boy was removed to the hospital little hope of his recovery was entertained. His back was burned all over and the skin of his legs and arms was all gone. He had protected his face with his hands, and the skin was burned off them. The efforts to make as comfortable as possible what seemed inevitably his last moments resulted in his gaining strength, and it was found that none of his vital organs were injured. The improvement was such that the physicians became convinced that if a sufficient quantity of human skin could be obtained and grafted on the boy, he would have a good chance for recovery. When this information reached the employees of the factory of the L. Wolff Mfg. Company, 200 of them agreed to allow little patches of their skin to be grafted to his body. Thirty-eight of the younger men in the shop presented themselves at the Norwegian Lutheran Tabitha Hospital, and submitted to the removal of a patch of skin from their arms. The operation will require seven or eight sittings. It is pleasing to note that among workmen striving for a livelihood there is a chivalry which is willing to sacrifice time and comfort for the benefit of a fellow workman. The L. Wolff Mfg. Company of Chicago are to be congratulated on having such a self-sacrificing set of employees.

The Ideal Premier Junior Boilers.

The quickly established popularity of the Ideal Premier boilers, made by the American Radiator Company, Chicago, as attested by the overwhelming demand during the two seasons the boilers have been upon the market, leads the company to believe that the heating trade will equally appreciate the new line of Ideal Premier Junior boilers or tank heaters, of which an illustration is here presented. Upon careful examination of the accompanying cut it will be observed that in this boiler are embodied practically all the features found in the large sizes of Ideal Premier boilers, with such changes in construction as, of course, are necessary to best adapt these tank heaters to the work they are specially intended to perform.



The Ideal Premier Junior Boilers.

Particular attention is invited to the construction of the fire pot, which is of unusual depth. The large center column is connected with the sides by radial arms to secure perfect circulation within the boiler itself. These radical arms and the overhanging central column contain a considerable quantity of water, placed directly above the fire in a manner which develops the highest degree of efficiency. The charging or fire door, as will readily be noticed, is placed unusually high, and as the fire pot is also made especially deep, provision is thereby made for carrying an extra amount of fuel. In consequence there is no occasion for frequent attention to the fire. Neither is there occasion to force the fire and consequently to waste the fuel. This large combustion chamber also permits the employment of all kinds of fuel—hard and soft coal, coke, gas and wood—even of the poorest quality.

As in all types of the Ideal boilers, the fire pot is corrugated, which increases the fire surface and its efficiency, and provides also free circulation of the air at the edges of the fire, insuring greatly improved combustion. The areas of the water ways are correctly proportioned and there is no opportunity for friction or choking of heated currents. The high efficiency of this tank heater is best demonstrated by the rapidity of the circulation therein. Every pound of iron, and all other material entering into the construction of the American Radiator Company's boilers, is not only carefully selected, but also subjected to the most severe tests and analysis. The result is a product of uniform thickness, smooth surface, toughness without brittleness, and, above all, a granular formation of the metal of extremely high heat absorbing efficiency. With ordinary care these tank heaters, the company claim, should endure as long as the building in which they are erected shall stand.

Consisting of so few parts, the boilers can be assembled or erected in less than a half hour. The possession of machinery built specially for the purpose by the company's experts insures that all parts are accurately machined and will assemble perfectly. Every boiler, the company say, is tested at 100 pounds hydrostatic pressure before shipment from the works. The ash pit is of ample capacity and the grates are of a late and improved pattern, giving splendid results. By means of drafts and check dampers the operation of the fire is under control.

This boiler is made in various sizes having capacity for heating from 100 to 550 gallons. The ratings are conservative. Where it is desired to employ a heater of greater than 550 gallons capacity the regular line of hot water house heating boilers are used. The trade are requested by the American Radiator Company to send for their special catalogue of Ideal tank heaters, illustrating the various uses to which they may be placed.

Chicago Convention Delegates.

In order that the delegates from the West may enjoy as much comfort as possible en route to the convention of the National Association of Master Plumbers at Atlantic City, N. J., the Master Plumbers' Association of Chicago are inviting delegates who must pass through Chicago to unite with them and secure, if possible, a special train.

The Chicago delegates are Wm. Redieske, J. B. Bryan, B. J. Hickey, A. C. Hickey, C. J. Herbert, M. J. Corboy, P. Saunders, David Whiteford, L. R. Bain, A. E. Mortimer, Jos. Schener, Thomas Conlin, John Sanders, A. K. Mose, Wm. J. Long, J. L. Corcoran, J. J. Wade, J. W. Brunt, Jacob G. Weber and Joseph Reilly.

The alternates are Henry Breyer, P. J. Foley, R. Coleman, J. H. Boyd, P. M. Murphy, T. P. Culloton, D. J. Rock, T. C. Boyd, J. A. Denniston, M. Farrell, J. G. Roland, Jacob Adler, J. R. Alcock, W. F. Knouss, C. M. Foskett, Charles W. Alcock, Andrew Young, Andrew Morrison, G. A. Larsch and Alfred Jones.

The delegates have organized with Charles T. Byrne, 718 Schiller Building, as chairman, and those who desire to travel with the Chicago delegates and have railroad accommodations reserved for them should communicate with him at once.

Charles C. Breyer, National committeeman; Charles J. Boyd, president of the Illinois State Association, and Charles T. Byrne are also delegates, owing to their official positions. These delegates should make pleasant traveling companions, and doubtless they will secure a sufficient number to accompany them to get special train service and so add comfort to the pleasure of the trip.

QUARTERMASTER W. E. COLE, Fort Barrancas, Fla., will receive bids until July 18 for plumbing and electric wiring the officers' quarters at that place.

NEW SANITARY ENAMELED WARE PLANT.

The United States Sanitary Mfg. Company of Pittsburgh, Pa., announce that they are now prepared to take orders from the trade for porcelain enameled baths and other enameled sanitary ware. The company have just completed a plant which is said to have cost upward of $500,000, and which, it is claimed, is equipped with the most modern appliances procurable. It is located at Monaca, Pa., 28 miles from Pittsburgh, on the Ohio River, and the line of the Pittsburgh & Lake Erie Railroad.

The company are composed of J. W. Arrott, Jr., A. E. Arrott and C. F. Arrott, the sons of J. W. Arrott, who for more than a quarter of a century was connected with the Standard Mfg. Company and the Standard Sanitary Mfg. Company of Pittsburgh, Pa., as president, treasurer and director. Mr. Arrott, Sr., has now retired from business. The "Arrott boys," as they are familiarly known in the trade, are all well versed in the enameling industry. Their father, J. W. Arrott, was one of the pioneers of the business in this country.

The officers of the new United States Sanitary Mfg. Company have issued a circular letter to the sanitary trade, announcing their entry into the business of manufacturing porcelain enameled baths and sanitary ware, in which they claim that their previous experience and knowledge of the business enable them to produce at once the highest grade of enameled goods without going through the period of experimenting usual with new manufacturers in this line. Their patterns, they say, are construeted on the most modern lines and embody the most approved sanitary features. Their porcelain enamel will be manufactured from the best and purest ingredients, and will be of the hardest and most durable character known in the business. The enamel will be applied by the use of natural gas as fuel, rendering it clean, pure and smooth.

The general offices and sales department of the United Sanitary Mfg. Company are located in the Arrott Building, Pittsburgh. The company have in preparation a very elaborate catalogue. They have been working hard since last November and now have ready a large line of new style baths, lavatories, sinks and other goods. They intend to market their product through the jobbing trade only.

The Monash-Younker Valves.

The Monash-Younker Company, Chicago, claiming to be the largest manufacturers of automatic air valves for radiators in the world, and for years manufacturing air valves under various names for different radiator and boiler manufacturers, have discontinued this practice and will in future make valves under their own name and trade-mark and sell direct to the steam fitting trade. This company have a most modern plant thoroughly equipped with especially designed automatic machinery and tools for turning out air valves. To obtain catalogue and discounts the fitting trade are requested to write direct to the company.

New York City Notes.

John F. Black of the firm of Black Bros., 142 St. Nicholas avenue, died of heart failure last Sunday while on a bicycle trip on Long Island.

⁂

Those plumbers whose work is ready are getting as much of it done as possible prior to July 1, when the higher rate of wages goes into effect. The journeymen are to get an advance from $3.75 to $4.25 a day and a Saturday half holiday.

⁂

The Examining Board are very busy with applications for certificates, but the high character of knowledge required to satisfy the board enables only the best of the applicants to pass.

⁂

Among the busy plumbers are Levins & Hennigan, who have a large apartment on Fifty-fourth street, between Broadway and Seventh avenue; Chas. Beck &

Bro., with an eight-story apartment at 42-44 West 120th street; John Rendell, who is plumbing an unfinished job at the corner of Broadway and 112th street, and W. J. Fowler of 2157 Seventh avenue, who has a large overhauling job in refitting the bathrooms in the Hotel Winthrop, Seventh avenue and 125th street.

⁂

The New York delegation to Atlantic City will go with full ranks and probably an overflow on the side, making passengers sufficient to charter a special train.

⁂

The Rockaway Beach contingent were alarmed by the fire that burned several blocks at that resort last Sunday night, and as a result of the work done by them several were laid up Monday from the effects of getting wet and overexertion.

Heating and Plumbing Notes.

D. L. Hood, Westfield, Mass., has been awarded the contract for furnishing the new heating and ventilating apparatus for the local High School at his bid of $7670.

Smith & Cotter, Springfield, Mass., are at work on a contract for plumbing in connection with the Mayor's office in the City Hall.

Scholl & Semple, Youngstown, Ohio, have leased the present site and buildings of the Mahoning Foundry & Machine Company, adjoining the tracks of the Erie Railroad, and expect to take possession in July. At the new site the company will place new machinery and equipment for conducting a general high pressure steam fitting business upon a larger scale than heretofore.

Crook, Horner & Co., Baltimore, Md., bid $5713 and secured the contract for heating and ventilating a new school house on Lakewood avenue and Orleans street.

The Colwell Lead Company, 63 Centre street, New York, are sending to the trade a circular showing a Compression Double Bath Cock, which has a U shaped body, matching the contour of the tub, and having the handles wider apart, so that they can be operated more freely and give more room in the tub. The U shaped body also brings the discharge tube further out, so that a full stream of water can be drawn in a pitcher without spattering. The whole Cock being below the top of the tub permits a board to be laid across the tub when desired. These Cocks are furnished with any style of coupling adapted to any kind of supply pipe, and with or without stuffing boxes.

F. J. Zimmerly & Co. of Fort Wayne, Ind., have opened a branch of their plumbing business at New Haven, Ind., under the management of T. J. Eiler.

George J. Tobin of Plainfield, N. J., bid $11,281 and secured the contract for heating the domestic building of the New Jersey State Reformatory at Rahway.

The William H. Page Boiler Company, Norwich, Conn., have just issued a 32-page catalogue, in a green cover, bearing a design in red, devoted to the extensive line of Steam and Hot Water Heaters and Radiators made by them, and also showing a variety of Steam Fitters' Supplies.

Weldon & Kelly of Pittsburgh, Pa., bid $4926 and secured the contract for plumbing the old portion of the High School Building in that city.

The Andrews Heating Company, 803 Globe Building, Minneapolis, Minn., are sending to the trade a pamphlet bound in imitation of their Home Heater. The back cover shows an elevation of a house in which one of their hot water heating systems is in use. The pamphlet presents half-tone engravings and plans of a number of buildings in which the Andrews heating system has been installed. It is designed to aid the heating contractor in securing contracts for such work.

The plumbing establishment of Thomas H. Lodge, Troy, N. Y., was slightly damaged last week by a fire which started in a box of oakum.

Robert G. Donnelly, who has been quartermaster in charge of the plumbing branch of the construction department at the Navy Yard at Charlestown, Mass., for the past five years, was recently officially appointed to the newly established rank of master plumber.

The Day-Ward Company, Warren, Ohio, are sending to the trade a pamphlet devoted to their fine Enameled Iron Bathtubs. These Tubs are shown in a variety of styles, with different styles of roll rim. Accompanying the engravings are diagrams giving the complete measurements of the Tub, which will be found of great assistance to plumbers in roughing in their work. A feature of these Tubs is the construction of the legs, they being made adjustable in hight to meet the unevenness of floors and so that they can be securely fastened to avoid their falling out.

The helpers of the plumbers working on the Ansonia apartment house at Seventy-fourth street and Broadway, New York, struck one day last week, and the police were appealed to for aid, as a number of the boys had mobbed one of the helpers who had refused to strike.

The plumbing establishment of Herbrick & Lawrence, at 607 Church street, Nashville, Tenn., was visited by a slight fire last week.

Graeber Brothers, Lawrence, Kan., have secured the contract for plumbing, wiring and heating the new railroad office at La Junta, Col.

The contract for a steam heating plant at the barracks at Fort Meade was awarded to Hurley & Co. of St. Paul, Minn., at their bid of $4600.

The National Oil Burner & Equipment Company, Carleton Building, St. Louis, Mo., are issuing a 16-page pamphlet devoted to their apparatus for burning crude oil under boilers and furnaces in factories and for manufacturing purposes. Sectional views, broken views and diagrams are used to show the apparatus, and an illustration is given of the equipment for burning fuel oil in a steam heater for heating a dwelling house. The catalogue will be of interest to those who are called upon to equip plants with fuel burning apparatus in sections where oil fuel is available.

The Putnam Foundry & Machine Company, Putnam, Conn., and Providence, R. I., have recently added to their line of Putnam and Plummer Boilers some portable sectional Boilers with 24 and 30 inch grates, adapted for either steam or hot water heating. It is claimed that the heating surface and flue arrangement of the Plummer Boiler has been increased so as to add materially to its efficiency. The Boilers are provided with new labor saving grates that can be dumped or having a draw center.

The Naugatuck Mfg. Company, Naugatuck, Conn., inform us that their present quarters being too cramped, they are now making alterations and changes in a plant which they have purchased in Union City, a suburb of Naugatuck, where they will have better facilities for making and getting out a varied line of Ball Floats, Copper Air Chambers for pumps, Hydraulic Rams and other specialties of interest to the plumbing and steam supply trade. The new building is well under way and will be ready for operation in July.

W. H. Colegrove, Austin, Pa., has the contract for plumbing five new houses for T. Bayless.

The Philip Carey Mfg. Company of Lockland, Ohio, are manufacturers of Flexible Cement Roofing and Asbestos and Asphalt Materials. Their Lockland plant produces Asbestos and Woolen Felt Coverings. About 12 acres are covered by their factory buildings. They have recently built a large three-story brick building to supply the demand for their Roofing, Roofing Paint and similar materials. The company also manufacture Asbestos Sectional Steam Pipe and Boiler Coverings, and 85 per cent. Magnesia Steam Pipe and Boiler Coverings, their factory at Corsons, Pa., being devoted exclusively to the production of the latter. This plant commenced operations during the early part of last year, but was destroyed by fire on June 9, 1901. Rebuilding was immediately commenced, but the new plant was only placed in operation about three months since. They have, however, shipped about 50 carloads of these goods since the resumption of business.

An important improvement has been made in the Forbes Die Stocks, manufactured by the Curtis & Curtis Company of Bridgeport, Conn. This is the adjustment of the shell or casing so that wear of gear may be taken up. In many machines for cutting and threading pipe the gear wears itself loose in the shell after a time, so that a perfectly straight thread is not easily obtained. This difficulty is wholly overcome in the new die and stock. The dies used are cheaper than solid Dies and much more durable. All parts of the machine are interchangeable.

The Hope Ventilating Company, Kansas City, Mo., manufacturers of Cone Ventilating Fans, Steel Plate Blowers and Exhausters and Hot Blast Heating Apparatus, have been incorporated under the name of the Hope Blower Company for the purpose of increasing their facilities and the addition of new lines of manufacture.

The Stover Mfg. Company, Freeport, Ill., have experienced a phenomenal business in Wind Mills thus far this year and although they are now turning out more than 100 per cent. more goods than a year ago they are not able to fill more than one-half of the orders booked. They have called their traveling men from the road, and have ceased all efforts to stimulate trade until they can make the factory end more nearly correspond with the demand. Future prospects are exceedingly bright and assure all the business they can possibly handle.

T. R. Warburton, Port Gibson, Miss., advises us that his branch shop at Fayette, Miss., was burned to the ground, together with nine other buildings, on May 29. Mr. Warburton does a general plumbing, tinning and roofing business at both Port Gibson and Lafayette.

N. Rubenstein, Houston street, New York, has recently patented and placed on the market a Seat Attachment for use in connection with Short Hopper Closets.

Heating contractors for large work will be interested in a pamphlet devoted to the Tread-Kill Grates, made by M. H. Treadwell & Co., 95-97 Liberty street, New York. The catalogue shows views of the different styles of Grate made by the house, adapted for furnaces of any size and for any use, particularly under large horizontal, tubular or other styles of steam boilers. The firm also make Boiler Fronts suited for their Grates of different sizes. The Grate consists of rocking bars, which are set in a frame and operated by means of levers from the front. They are adapted to different varieties of coal and provided with air space to facilitate the combustion. The character of the Grate may be understood when it is pointed out that many of the parts which are called upon to stand strain are made of malleable iron and the shaking lever and rods of forged steel. It is further claimed that the Grate is perfectly well fitted, no part of which is made to meet cheap competition, but rather to meet the best on the ground of merit alone.

F. S. Shields, secretary of the Board of Sewerage and Water, 602 Carondelet street, New Orleans, La., will receive bids until August 12 for furnishing and erecting engines with centrifugal pumping machinery, boilers, dynamos and transmission lines and other appurtenances for the equipment of the central steam driven pumping and generating station, and for the transmission lines to seven substations, and for motors and pumps for the automatic operation of these substations; also, for the equipment of one small independent steam driven pumping station, 14 centrifugal pumps, having a capacity of 12,000 cubic feet per minute, the range in lift varying from 7 to 56 feet. After June 20 specifications can be seen at the office of Hering & Fuller, consulting engineers, 170 Broadway, New York City.

Baker, Smith & Co., New York, who put three Royal Hot Water Heaters in the "building of primates," otherwise monkey house, at the Zoo, in Bronx Park, last year, are now putting two No. 60 Royal Hot Water Heaters in the lion house.

The master plumbers of Troy, N. Y., through their attorney, have served notice on the city administration that permits to tap sewers and water mains are being issued to persons who do not possess certificates of competency, and that the law in this respect is being violated. This is held to be an injustice to plumbers who have passed an examination and taken out a license.

N. M. Dunn died at his home, 208 Lexington avenue, Brooklyn, N. Y., on June 3. He was connected with the plumbing firm of P. & L. Dunn, and was born in New York City in 1834. Mr. Dunn is survived by three sons and two daughters.

George S. Hughes, who organized the division of House Drainage and Plumbing Inspection of the Bureau of Health of Philadelphia 16 years ago, and who has been its chief ever since, died on June 1 at his home, 1431 North Park avenue, aged 60 years. He had been identified with the plumbing and gas fitting trade during his life. He served four years during the war in the Fifth Pennsylvania Cavalry, and at the time of his death was president of the Regimental Association of the survivors. He is survived by his widow and one daughter.

Robert Scott, Philadelphia, has the contract for installing a $25,000 low pressure steam heating and ventilating apparatus for the Widener Memorial Home for Crippled Children at Tioga. He has also contracts for installing a $1500 hot water heating apparatus in the house of Charles W. Henry, Chestnut Hill; a $2200 low pressure indirect steam heating apparatus in the house of Lenore G. McCall, Forty-second and Walnut streets, and a $1900 hot water heating apparatus for Robert R. Logan, 212 South Eighth street.

State Vice-President Robert W. Kyle met with E. L. Martin, Russell Smoot and John Mayhew at Parkersburg, W. Va., on Wednesday for the purpose of organizing a State association of master plumbers.

The Metal Worker acknowledges the receipt of an invitation from W. Emmet Crosby, executive clerk of the National Association of Master Plumbers, to attend the commencement exercises of the Kansas City School of Law on June 11, at the Century Theater in Kansas City, Mo. Mr. Crosby has devoted some time to the reading of law for several years, and will doubtless soon make application for admission to the bar.

The Thomas P. Ford Company, 81 Centre street, New York, are sending to the heating and plumbing trade a 32-page catalogue devoted to the Ford Steam and Water Specialties. These consist of Automatic Pump Governors, Damper Regulators, High and Low Pressure Steam Reducing Valves, Steam Traps and Steam Separators, Boiler Feed Regulators, Force Draft Regulating Valves and Water Pressure Reducing Valves, besides some other standard appliances. Sectional views and diagrams are used with the general views, to make the construction and use of the various devices readily understood. The text is a terse explanation and includes a price-list of the various devices presented.

New Firms and Changes.

J. F. Noonan, formerly employed by the Selvey-Wyckoff Company as foreman on their big contract in connection with the locomobile factory in Bridgeport, Conn., has recently opened a shop under the Russell Hotel at 226 Main street, Springfield, Mass.

Fred. Hathaway of Rochester, Pa., and E. E. Pagett of Pittsburgh have entered into a partnership in the plumbing business in the shop on Brighton avenue, Rochester, Pa., formerly occupied by George Reeb.

Jenkins & Wallace have purchased the plumbing business of J. E. Galnett, at Franklin, N. H.

The Alden Sheet Metal Working & Plumbing Company of Brockton, Mass., have been incorporated with a capital of $5000. George Q. Clifford is the president and Charles L. Clifford treasurer of the company.

The Newman Mfg. Company have been incorporated at Elizabeth, N. J., with a capital of $5000, by J. W. Newman, Charles Brown and George W. Orthey, to manufacture Steam Specialties.

The James D. Ryan Heating & Ventilating Company have been incorporated at St. Louis, with a paid in capital of $10,000, by S. Ryan, Wm. M. Stanton and James D. Ryan.

The National Disinfectant Company of Jersey City, N. J., have been incorporated, with a capital of $600,000, by R. N. Hazard, R. W. Browne and Samuel S. Hawk, to manufacture disinfectants.

Cold Working Sheet Metal in Dies.*

BY J. D RIGGS. PITTSBURGH, PA.

IN TWO PARTS. PART I.

During the last half century a marked progress has been made in the art of working sheet metal. The introduction of more elaborate machinery and tools, and the change from hand work to die work, has brought about some very radical changes, both in the design of articles made of sheet metal and in the cost of producing them. The development of this art has led to the use of sheet metal in the construction of a great many articles formerly made of wood or cast metal. As an example of what we often meet with I may mention that while visiting Cincinnati two years ago, I was shown parts for the body of a violin which had been stamped in dies from an aluminum bronze. These violins were said to be excellent instruments.

THE METAL WORKER

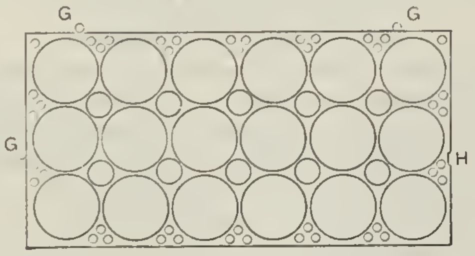
Fig. 3.

Cold Working Sheet Metal in Dies.

Dies operated by presses do a large share of the work of manufacturing sheet metal goods, and are useful in cutting out irregular forms cheaply and accurately, but their usefulness does not end here, for an endless variety of bending, drawing, and forging operations may be done by them, some bending or drawing operation often being combined with the cutting out and perfomed together with it. One of the most common pieces produced in dies is the end of an ordinary tin can. Referring to Fig. 1, this piece is cut into a round disk and then the annular portion, *b*, is drawn to the cylindrical form, *p*.



THE METAL WORKER

Fig. 4.

The problem of finding the depth of cup which a disk or " blank " will make may be solved by equating areas of cylindrical ring, *p*, and annular ring, *b*.

$$\pi Cd = \pi (C + b)\, b = \pi Cb + \pi b^2$$

Reducing and allowing for stretch

$$p = b + \frac{b^2}{C} + s$$

And as the corner is always more or less rounded, we may say

$$p = b + \frac{b^2}{C} + s + \frac{r}{2}$$

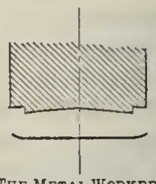
where *s* represents the stretch or elongation of the metal in the edge, *p*, and varies from 0 to 5 per cent. of *p*, in tin plate or steel; *r* represents the radius of the rounded corner. The diameter of the blank is represented by

$$C + 2b$$

Fig. 2 shows a typical die as used in sigle acting presses for forming can ends and similar articles. The right side shows the die closed, while the left side shows the relation of parts when open. The hardened steel ring, *m*, and the steel edge, *k*, of the punch, *i*, cut out the disk or blank. As the press continues to descend, the ring, *n*, clamps the annular part against the face of the punch, *k*, and produces a considerable tension in the metal as it is drawn over the central portion, *l*. As the die opens the ring, *n*, " strips " the finished piece up from *l*. Ring, *n*, is actuated by a spring through pins, *g*, and has adjustment by means of a nut on the lower end of the stud bolt, *t*. Both rubber and steel springs are in use, but either should be amply long.

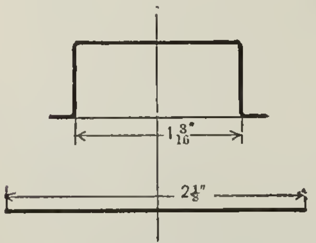
THE METAL WORKER

Fig. 5.



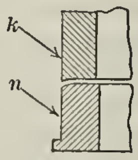
THE METAL WORKER

Fig. 6.



THE METAL WORKER

Fig. 7.

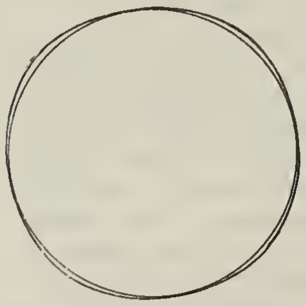


THE METAL WORKER

Fig. 8.

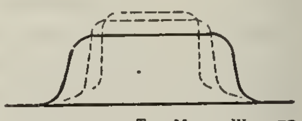
The die (collectively) consists of the die and the punch. When dies are required for cutting only, the die may be made as shown in Fig. 3.

A concern extensively engaged in the manufacture of tin cans have been using for some time dies similar to that shown in Fig. 2, in " gangs." They leave off the stem, *h*, from the punch and recess the body, *i*, of several into a large plate, and instead of the small plate, *p*, a large one is used with many dies set into it. In this manner gang dies are made to cut the alternate large disks shown in Fig. 4, and the sheet is then turned over from right to left, and the remaining large disks cut and formed into can ends. The die rings, *m*, Fig. 2, interfered with cutting all the large disks at one stroke. The remaining sheet is then laid aside, to be afterward put into another gang die, which cuts and forms the remaining disks into can caps, shown in Fig. 5, and button blanks, shown in Fig. 6. The die for each group of three small disks, and corresponding to *m*, Fig. 3, is made in one piece, which allows of cutting and forming the 52 pieces at one stroke of the press. Although this gang die formed two distinct articles, it did not mix them together, as the can caps came out on top of the die and slid back in the inclined press, while the button blanks formed on the peculiar punch shown in



THE METAL WORKER

Fig. 9.



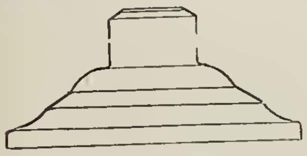
THE METAL WORKER

Fig. 10.

---

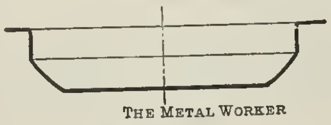
*Presented at the Boston meeting (May, 1902) of the American Society of Mechanical Engineers.

Fig. 6, and went through the die. It will be observed that this sheet of tin is not standard size, but is 11 by 22 inches, which was a very difficult size to get 15 years ago. Gauges, *G*, Fig. 4, and notching die, *H*, were so arranged that the irregularity of the sheets would not be reproduced and interfere with using the second set of dies.



THE METAL WORKER

Fig. 11.



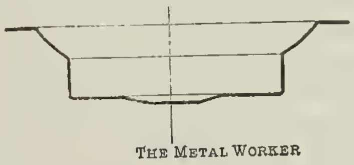
THE METAL WORKER

Fig. 12.

The depth which may be drawn at one operation is commonly expressed as equal to half the diameter for small cups and one-third or one-fourth for larger vessels. Fig. 7 shows a tin cup formed at once in a die represented by Fig. 2, with the exception shown in Fig. 8. The radial edge of the cup was required, and less than a square corner for the cutting edge of the punch was desirable. This concave face of the punch, *k*, together with a hardened and nicely polished ring, *n*, gave excellent results.

Where a depth greater than can be drawn in one operation is required, or a small boss is wanted near the center of a sheet, it becomes necessary to resort to two or more operations, forming a larger and shallower piece first, and then reducing this to the desired form.

An interesting example of this class of work was shown in operation at the Pan-American Exposition. The can top shown in Fig. 11, ready for rolling a thread at *t*, was first cut and formed to the shape shown in Fig. 10, by a die of the type shown in Fig. 2. It then passes through some four other dies and through the forms indicated by dotted lines in Fig. 10, the last one of these dies cutting the hole in the top, trimming and turning the outer edge and shaping it up generally, but not materially reducing the diameter of the boss.



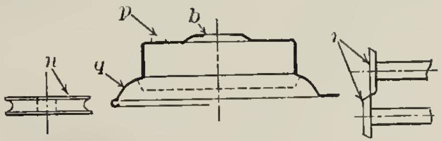
THE METAL WORKER

Fig. 13.

Another example of this reducing is found in one form of bicycle front fork crown, where a boss is formed to which to attach the fork stem.

In deep drawn work the edge becomes irregular, and is often trimmed again before finishing the piece. In Fig. 9 the outer line is drawn directly from the piece shown in section in Fig. 10, while the inner line is a circle drawn to illustrate the peculiar irregularity of the edge, showing as is common four high points. I attribute these high and low points to the rolling mill which rolls the sheets.

Passing to work done in double acting presses, Fig. 12 shows a piece formed of tin plate in a die shown in Fig. 15, where the outer punch, *b*, descends, cuts out the blank, and, during its "dwell," clamps the disk against the ring, *g*, while the inner punch descends just far enough to give the required shape. This piece, Fig. 12, is then put into a die, Fig. 16, where the outer punch, *i*, clamps the tapering portion against the die, and the inner punch descends just far enough to produce the piece shown in Fig. 13. This piece is next put through a single acting die, which cuts the holes *o* and *p*, and rounds the base at *q* somewhat more. The piece is now put into a lathe, Fig. 14, which carries a pair of rotary cutters, *r*, on the back, and a curling roll, *n*, on the front end of the cross slide. After this lathe has trimmed and curled the edge the piece goes into a bath of hot palm oil to have its coat of tin reshined, and is then ready to have other pieces attached and form the oil well of a tubular lantern.



THE METAL WORKER

Fig. 14.

The trimming cutters, *r*, and the curling roll, *n*, are used in a variety of ways, either together or separately. Three of these rolls are often put into a body and form a chuck, to be used in a machine similar to a drill press, to curl the edge of pails and round vessels. If the dies shown in Figs. 15 and 16 had been made open bottom, and the inner punches had been adjusted lower, the piece produced would have been a cylindrical cup instead of as shown in Fig. 13.

◆

The Amalgamated Association.

An important step was taken last week by the officials of the Amalgamated Association of Iron, Steel and Tin Workers in admitting to membership in the association the local lodges of the American Federation of Labor in the Eastern Iron and steel mills which were organized during the strike about a year ago. This means an increase in membership of the Amalgamated Association of something like 15,000 men. It is understood that these lodges were organized by the American Federation of Labor after the strike of last year, with the understanding that they would eventually be taken into the Amalgamated Association. Previous to this action the association had less than a dozen lodges in affiliation with it east of the Alleghany Mountains. This step is regarded as of doubtful wisdom by many in the Amalgamated Association. It has been tried before, experimentally, with unsatisfactory results; because the workers in the East do not receive the same wage rate as those in the West. It is regarded as likely, however, that no attempt will be made to establish a uniform rate of wages for East and West at present, as such an attempt, it is thought, would be likely to involve the Amalgamated Association in labor difficulties.

A number of wage conferences between the officials of the various iron and steel companies which recognize the Amalgamated Association and the wage committees of that association will be held during the present month. These include conferences with the Republic Iron & Steel Company, the American Steel Hoop Company, American Tin Plate Company and American Sheet Steel Company. It is understood that whatever arrangements are come to with the Republic Company in regard to the ratification of the wage agreements will be endorsed by the various constituent companies of the United States Steel Corporation. No difficulty is looked for, these conferences being merely of a formal nature, in order to officially close the several wage agreements for the coming year.

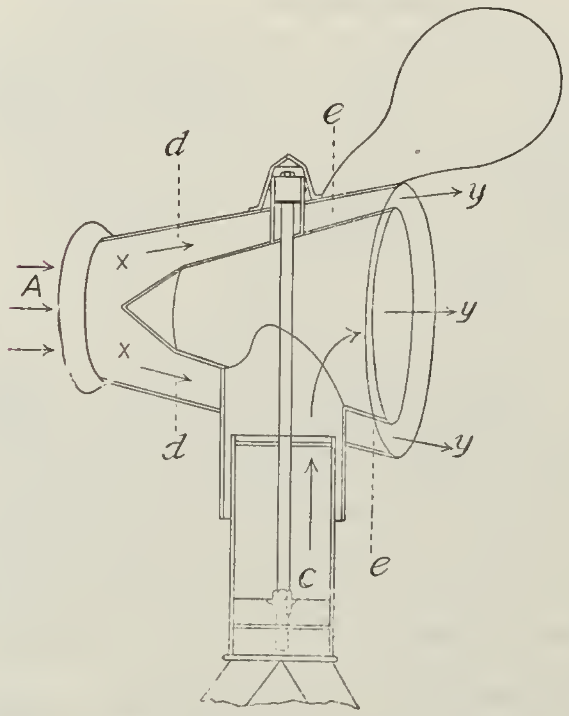
◆

The West Carnegie Sheet Steel Company.

The principal contracts have been awarded for the new plant of the West Carnegie Sheet Steel Company, who will erect a six-mill sheet plant at West Carnegie, Pa. The contract for two 25-ton basic open hearth furnaces has been given to E. E. Erikson of Pittsburgh. The Gruson Iron Works of Philadelphia will furnish the mills, including a combination blooming and sheet bar mill, and six stands of hot rolls, including one stand of rolls 44 inches long, four 38 inches long and one 32 inches long, all being 26 inches in diameter; also two cold rolls 44 and 38 inches long respectively. The machinery will be driven by three Hamilton-Corliss engines made by the Hooven, Owens & Rentschler Company, and 1500 horse-power of boilers of the B. & W. type will be furnished by the Erie City Iron Works. The buildings will be erected by the Fort Pitt Bridge Company, Pittsburgh, and the Morgan Engineering Company will furnish an electric crane. The main building will be 340 feet long and 140 feet wide at the open hearth end and 120 feet wide at the sheet mill end. The hot and cold mills will be arranged together in two trains, with three hot mills and a cold mill on each side of the pair of engines. Work will be begun on the contracts at once, but it is not expected that the plant will be ready for active operation much before the first of next year. The company will manufacture common sheets exclusively. It is understood that D. R. Torrance, City Treasurer of Pittsburgh, will be elected president; John F. Steele, treasurer, and W. H. Skivington, secretary, of the company. George C. Brown, who has designed the mill, will be the general manager. The offices of the company are at present located at 317 to 319 Park Building, Pittsburgh.

The Auto-Force Ventilator.

It would be inappropriate to say of ventilators and chimney caps, as the wise man said of the making of books, that there is no end, for these devices are always attached to the top end of the chimney or some other outlet for gases and air. In the accompanying illustration is given a sectional view of another new production in this line, the Auto-Force ventilator, made by the Nickerson Force Draft Ventilator Company, 303 Sudbury Building, Boston, Mass. This ventilator consists of a revolving cowl composed of an interior and outer cone. The inner cone connects directly with the chimney or space to be ventilated, while the point of the outer cone is made so as always to face the wind by means of a tail piece attached to it. It is claimed that in operation the air passes in at A and increase in velocity until its exit at *y*, which acts in somewhat similar manner to a steam injector, creating a vacuum at the mouth of the smaller cone and causing an upward rush of air or smoke through the pipe C. It is also pointed out that the inner cone, becoming heated, creates a draft through the outer cone and aids the draft, even when the outside air is quiet. These ventilators have been used with success on railroad cars, dining rooms, tunnels, mines, schools, theaters and chimneys. The company issue a 20-page pamphlet thoroughly explaining the construction and operation of the device.



The Auto-Force Ventilator.

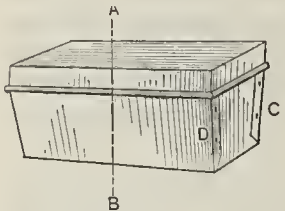
◆

The J. Wood & Brothers Company, Conshohocken, Pa., have increased the wages of the employees at their mills 10 per cent.

PATTERN FOR ICE CREAM MOLD.

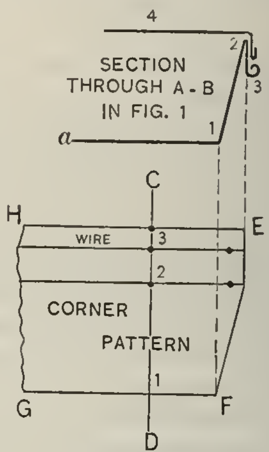
(Without allowance for Laps.)

An article which can be made from IX tin or No. 24 galvanized iron, and which is now in season, is an ice cream mold (brick form). In Fig. 1 is shown a perspective view of the mold with cover. The corners can either be riveted, as shown by C and D, or double seamed. The seams should be soldered on the inside in such a manner that the inside surface will be as perfectly smooth as if the mold were stamped in one piece. While some molds are made perfectly square—that is, no bevel is given to the sides—the pattern described below is cut on a bevel to allow the molded cream to slip out easily.



The Metal Worker

Fig. 1.—Perspective View of Finished Ice Cream Mold.

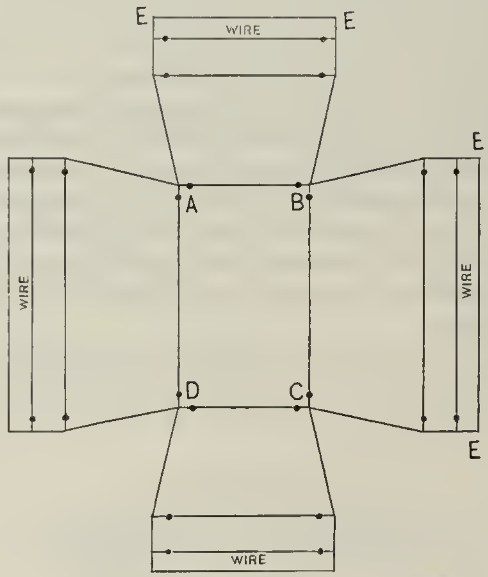


The Metal Worker

Fig. 2.—Method of Obtaining Pattern for One Corner.

Pattern for Ice Cream Mold.

In laying out the pattern it is not necessary to draw the entire form, but only one corner. Providing that all the sides have the same bevel, this one corner pattern is all that will be required to obtain the pattern in one piece. In Fig. 2 let 1, 2, 3, 4 be a section taken through A B in Fig. 1, 1, 2, 3 in Fig. 2 being the body of the mold, with wire at 3, while 4 indicates the cover. For the pattern for the corner draw any line, as C D, at right angles to *a* 1, upon which place the stretchout of 1, 2 and 3 in the section, as shown by 1, 2 and 3 on C D, also allowing for wire, as shown. At right angles to C D and through the small figures draw lines, as shown, which intersect with lines drawn at right angles to *a* 1 from intersections 1, 2 and 3 in the section. Trace a line through points thus obtained. Then will E F G H be the corner pattern.



The Metal Worker

Fig. 3.—Pattern for Mold in One Piece.

Now, assuming that the bottom of the mold is to be of a given size, as shown by A B C D in Fig 3, around which the sides are to be constructed, take the pattern G F E in Fig. 2, and, laying the line G F successively against the corners and lines A B, B C, C D and D A in Fig. 3, turning the pattern right and left as required, mark off the miters E, E, E, &c., as shown. Then will the pattern shown in Fig. 3 be the full pattern for the mold in one piece. Allowance must be made for seaming or riveting. The pattern for the cover 4 in Fig. 2 is so simple that a description is omitted.

The Wheeling Roofing & Cornice Company.

The Wheeling Roofing & Cornice Company of Wheeling, W. Va., advise us that it is their intention to erect a sheet mill and open hearth furnace in connection with their new plant now under construction at New Martinsville. The company have purchased 45 acres of ground, in addition to the 5 acres donated by the city of New Martinsville, on the main track of the Ohio River Railroad. They are erecting a tin mill, 60 x 320 feet, containing eight pots, with provision for 12 more, all of improved duplex pattern, producing 120 boxes per 24 hours, and equipped with Taylor's patent automatic trimming machines; galvanizing shop, 70 x 320 feet, equipped with four pots, two Mesta picklers, four sheet straighteners, weighing machines, &c.; corrugating shop, 60 x 200 feet, equipped with special machinery, the invention of F. Taylor, general manager; conductor pipe shop, 60 x 200 feet, with a capacity of 200,000 feet per 24 hours; eave trough shop, 50 x 150 feet, equipped with Taylor patent machinery, producing 500,000 feet per 24 hours; hanger shop, 36 x 250 feet, in which will be made cut offs, elbow miters and other small articles, and a building, 180 x 400 feet, for stamped ceiling and ornamental stamped metal work, equipped with machinery to stamp in one operation sheets that are now stamped in four operations.

The Uses of Coal Tar Products.

The best known and most largely used felts and paper for roofing and sheathing purposes are today manufactured from coal tar, or materials resulting from its distillation. It is a matter of common knowledge that coal tar is produced at gas works in the operation of manufacturing illuminating gas from coal. The direct distillation of coal tar produces first, light oils, or oils heavier than water; and finally, a residuum commonly sold in the market as coal tar pitch.

The latter material is now used for a large variety of purposes, owing to its high water proof and nonconducting properties. Roofing and building papers are saturated and lined with it. A perfectly water proof building paper is produced by cementing together two sheets or ordinary dry paper with a layer of coal tar pitch, not exceeding 1-100 inch in thickness, a better quality having three layers of paper and two fillings of pitch. The same dry paper cemented to a wool felt with pitch produces a water proof deadening felt which is the best nonconductor of sound of any felt that so far has been produced.

That materials so produced have proven satisfactory is attested by the largely increased rate of consumption in the past ten years. Their manufacture was formerly confined to two or three of the Eastern cities, whereas to-day large factories are located in almost all of the large cities East, West and South, many of which, however, following the example in other trades, have been consolidated into fewer and more compact concerns, although new competition is continually entering the field.

All the advantages to be derived from the use of these materials are known to comparatively few people, while some of the advantages are known to many. Gravel, slag and ready roofings, water tight floors and cellars, street pavements and sidewalks, are constructed from them in their various combinations. Dead oil produces lampblack and is used under name of creosote oil for the saturation of timber, to prevent decay.

A meeting of the stockholders of the Sharon Steel Company, Sharon, Pa., will be held in August, for the purpose of voting upon an increase in the capital stock of the company, from $5,000,000 to $6,000,000. The Sheet and Pipe mill departments of the concern will be placed in operation early in August.

FLASHINGS.

All the machinery for the new plant of the Marietta Sheet & Tin Plate Company, Marietta, Ohio, has been contracted for and will probably be placed in position during July. The company have decided to enlarge the plant beyond the original plans, the main building being extended from 260 feet in length to 300 feet, and the tinning plant from 200 to 300 feet. It is expected that the plant will be in operation by September 1.

John F. Budke has resigned as president and manager of the Parkersburg Iron & Steel Company, Parkersburg, W. Va., and will return to Canonsburg, Pa., where he is organizing the Budke Iron & Steel Company, to erect a six-mill Sheet plant with eight puddling furnaces and a three-high Bar mill. It is probable that the plant may be built at Shannopin on the Lake Erie road, 22 miles from Pittsburgh, where Mr. Budke has secured options on 157 acres of land.

John Collins, superintendent of the Old Meadow plant of the American Sheet Steel Company, at Scottdale, Pa., died on May 25 at his home in that town, aged 57 years. Mr. Collins, who was a native of England, came to this country in 1887 and located at Scottdale, where he had been engaged in the manufacture of Steel Sheets ever since.

The Maryland Sheet & Steel Company, Cumberland, Md., have placed an order with the George A. Hogg Iron & Steel Foundry Company, Pittsburgh, Pa., for a 38-inch roll lathe.

The plant of the American Tin Plate Company, at Ellwood City, Pa., was closed down last week for extensive repairs.

The Tin Plate mills of the N. & G. Taylor Company and the plant of the Maryland Sheet & Steel Company of Cumberland, Md., were shut down last week for a few days for repairs and improvements.

The Indianapolis Sheet Metal Company of Indianapolis, Ind., have been incorporated with a capital stock of $10,000 to manufacture Tin and Sheet Metal Specialties.

The Carnahan Stamping & Enameling Company of Canton, Ohio, are figuring on an important enlargement of their enameling plant. For this purpose they propose to invest in the plant an additional capital of about $500,000, which will be devoted to the manufacture of Enameled Ware. When complete the projected works will be one of the largest of its kind in the country and will turn out an infinite variety of patterns, ranging from 60-gallon Preserve Kettles down to Enameled Iron Spoons. The company are closely allied with the Berger Mfg. Company, the principal officers of the two companies being the same.

The Hampden Cornice Works, Springfield, Mass., have been awarded a large contract for metal work, including Copper Roofing and Skylights, on the new Crane Natural History and Art Building, at Pittsfield, Mass.

The New England Steel Roofing Company suffered a loss of $8000 by the fire in Day Buildings, Worcester, Mass., the company's quarters being thoroughly gutted. The loss is covered by insurance.

The American Sheet Steel Company are dismantling their Russia mill at Niles, Ohio, which consists of two Sheet mills, one muck train and 23 puddling furnaces. The plant has never been operated since the organization of the American Sheet Steel Company. The Falcon mills of the American Sheet Steel Company, also at Niles, have been closed down for the present.

The Decatur Cornice & Roofing Company, New Decatur, Ala., expect within the next few months to take possession of their new factory, the capacity of which, they advise us, will be six times that of the plant now occupied. The company state that they are unusually busy for this season of the year, and the prospects for the remainder of 1902 are most encouraging.

The Columbia Can Company, St. Louis, Mo., recently incorporated, will erect a large plant at 501 North street, which will be equipped with the latest improved machinery. The officers are Herman F. Westerneck, president;

Fred. L. Westerbeck, Jr., vice-president; Emil J. Westerbeck, secretary and treasurer, and Charles Doermann, manager.

The report is incorrect that an order has been issued from the New York office of the United States Steel Corporation to the effect that the mills of the W. Dewees Wood works, of the American Sheet Steel Company, at McKeesport, Pa., would not be started up until Monday morning at 4 o'clock instead of Sunday evening, the practice heretofore. No such order has been issued, nor has there been any change made in the time of starting up this plant.

The Youngstown Iron Sheet & Tube Company, who recently bought Claire Furnace at Sharpsville, Pa., from Pickands, Mather & Co., will take possession of the stack on June 10. The furnace is turning out about 250 tons of iron per day, and this metal will be used in the new basic open hearth steel works now being built by the Youngstown Company at Hazelton, Youngstown.

The Edwards Mfg. Company, 119 Sycamore street, Cincinnati, Ohio, are sending out a new catalogue showing some of the goods which they manufacture in the line of Roofing, Eave Trough, Conductor Pipe and Fittings. These include Roll and Cap Steel Roofing, Double Seam Roll Roofing, Pressed Standing Seam Steel Roofing, V-Crimped Roofing, Imitation Weather Boarding, Pressed Zinc Siding, Corrugated Sheets, painted or galvanized, Corrugated Siding and Ridging, Beaded Ceiling, Ridge Cap, Galvanized Eaves Trough, Eaves Trough Ends and Miters, Conductor Pipe, Elbows and Shoes, Conductor Strainers, Conductor Pipe Hooks and the Edwards Wire Eaves Trough Hangers. The company state that their large catalogue of ornamental material, including Cornices, Skylights, &c., will be mailed to any one interested, upon application.

The Eruption of Mt. Pelee.

It is natural that the extraordinary convulsion of nature in the recent volcanic explosion on the island of Martinique should arouse great interest in the question of the cause of an occurrence so unprecedented in the later history of the world. Scientists are giving much thought and study to the matter, and a number of them are now investigating on the spot. Particular difficulty has been found in explaining the vast sheet of flame that seems to have accompanied or closely followed the explosion, and which swept over the city of St. Pierre in a tornado of fire, destroying every living thing and burning up even the buildings and other inanimate objects. The most plausible view of the cause of the phenomenon so far advanced seems to be that offered by Professor Verrill of Yale University, who is of the opinion that by some means sea water, at great depth and under pressure due to great head, got access to the subterranean fires of which Mount Pelée was once an outlet. Encountering there an intense temperature, the water was vaporized, superheated and decomposed, separating primarily into hydrogen and oxygen. Thus dissociated, the hydrogen would remain free, but the oxygen would seek association with carbon, forming carbonic oxide. Besides hydrogen and oxygen, sea water contains chlorides and bromides, which, on gasification, would be converted into chlorine and bromine. The chlorine might unite with hydrogen, forming hydrochloric acid. These inflammable gases, suddenly ejected with great violence, would be calculated to produce the effects manifested. The carbonic oxide or the hydrochloric acid would quickly poison and suffocate all who breathed them in quantities, and the explosion and ignition of the gases would explain the sheet of flame which burnt the clothes and flesh of the victims.

* * *

For the first time in six years the entire installation of the Niagara Falls Power Company, at Niagara Falls, N. Y., was shut down early on the morning of Sunday, June 1, and the great turbines and dynamos stood still. The stoppage was to enable an inspection of the tunnel and wheel pits, and to knock out the bulkheads between the two wheel pits, thus permanently connecting them. The time selected for the stoppage was shortly after midnight on Sunday morning, when the demand for power was the least. A thorough inspection of every part of the tunnel was made by the engineers and it was found to be in perfectly sound condition. All the industries supplied by the power plant were necessarily shut down during the inspection.

THE ADVERTISING END.

BY W. A. F.

In these days of advanced business methods and keen competition the man who would succeed must give some attention to the subject of advertising in some form or other. Almost every business man realizes this, although the statement is frequently made that a great deal of the money spent in advertising is literally thrown away.

This, no doubt, is true in a measure; but, in a majority of instances where no benefit is derived the advertiser is at fault. The time honored custom of putting a card in the local paper and letting it stand unchanged in any particular for months, and even years, is not a judicious expenditure of money.

It is doubtful if the men engaged in any line of business are, as a whole, more closely wedded to the perfunctory, humdrum style of advertising mentioned than those engaged in the plumbing and tinning trades. The writer recalls one who kept a standing "ad." in a local paper for a long term of years without any alteration whatever. Some names of parties well-known in that locality were given as references, and long after some of them had passed from this vale of tears the advertiser continued to pay to have their names published each week among the list of well satisfied customers. Of course, such advertising does not pay. People will not read old advertisements, but they will read new ones and will favor with their patronage the man who is enterprising enough to make an effort to attract attention to his business.

Only ocasionally is there a plumber or tinner who gives thought and attention enough to this subject. Too often he relies on the quality of the work he does to advertise his business. A reputation for doing good work is of course desirable, but it will do little more than retain the custom one already has, for the reason that a customer, no matter how well satisfied, will not, as a rule, go out of his way to boom some other man's trade.

It is not necessary for a mechanic to be an expert in the art of advertising in order to make his investments along that line paying ones. Neither is it necessary to use a vast amount of space in order to attract atention. Many people will read a short "ad." who will not read a long one. If one has original ideas, and gives some time to it, he can in a comparatively short time interest a large circle of readers, who will accustom themselves to looking for his latest effort; and, from being interested in what a man says about his business, to becoming a customer of his is but a short step.

If a weekly newspaper is used as an advertising medium the "ad." should be changed every week, so that the public will know the advertiser has not died or moved away since the week before. In this way even an indifferent workman can keep himself very much in evidence.

Another method of attracting favorable notice, but which through neglect too often attracts the other kind, is the arrangement of the plumber's shop front. If he conducts a store in connection with his shop, some attention is generally given to making a front window display. But if not, many neglect to make any effort to attract the attention of the passing public. If the windows are kept clean enough to see through, and the newest and brightest goods are kept in front, and frequent changes are made in the arrangement of them, they will be looked at and commented on to the plumber's advantage.

No matter what method of advertising a tradesman adopts as the best for his purpose, he should keep it up every season of the year, and not do it by fits and starts.

THE LETTER BOX.

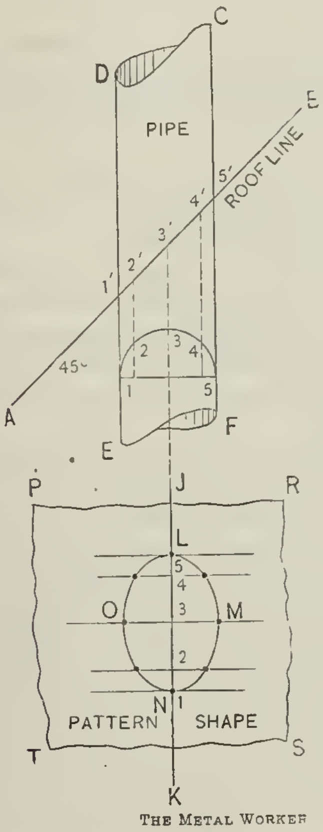
Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

PATTERN FOR ROOF FLASHING.

From E. S. P.—Will you kindly inform me through the columns of *The Metal Worker* how to strike out the patterns for roof flashings for soil pipes of 4 and 2 inch diameters on 45 and 30 degree roofs respectively?

Answer.—In this connection it may be proper to remark that it makes no difference what pitch the roof has or what size pipe passes through the roof, the principles hereinafter explained being applicable to any case. In the accompanying illustrations let A B represent the roof line at an angle of 45 degrees, through which the pipe C D E F is to pass. Now, at right angles to D E draw the semicircle 1 3 5, which divide into equal spaces, as shown by the small figures 1 to 5. Parallel to the lines of the pipe D E or C F and from these small figures draw lines intersecting the line of the roof A B at points 1', 2', 3', 4' and 5'. Take a tracing of these points and place them on the vertical line J K, as shown from 1 to 5, through which at right angles to J K draw lines, as shown. Now, measuring in each instance from the line 1 5 in the pipe, take the various distances to the points 2, 3 and 4 in the semicircle and place them on corresponding numbered lines in the pattern, measuring in each instance from the line J K on either side, thus obtaining the intersections shown by the small dots. A line traced through these points, as shown by L M N O, will be the shape of the opening to be cut in the flashing P R S T.



Pattern for Roof Flashing.

ROOFING OVER OLD ROOFS.

From O. H. R., Chrisman, Ill.—Complying with the request of "G. A. H." in *The Metal Worker* of May 24, I would state that whenever a new steel roof is laid directly on or over an old one of like material there seems to be a strong inducement for the condensation of all heavy atmosphere or dampness of any kind, which will in a very short time cause the roof to become rusted and practically ruined. I lay a new tin or sheet metal roof on common dry felt paper or lay it on the sheathing, which, to a greater or less degree, provides for the moisture under the roof being absorbed. I would not advise laying new roofs on old shingles or the coal tar felts that can be generally had.

WANTS TO HEAT A CONSERVATORY.

From G. J. T., Baltimore, Md.—A customer of mine has a porch on his cottage which he desires to inclose and convert into a conservatory. It is 8 x 14 x 10 feet in size, having an eastern exposure of 8 feet and a southern exposure of 14 feet. The open space under the porch will be inclosed with boards and filled in with sawdust or other nonconducting material. At present the cottage is warmed by a steam heater, and it is desired to heat this addition from the steam heater. The question upon which I desire the readers of *The Metal Worker* to assist me is the amount of radiation needed in a cast iron upright radiator or in a heating coil made of pipes to run along the outside wall of the room. The latter plan, I think, is the better way to accomplish the result. The boiler is only 8 feet away from the conservatory. The house is heated on the one-pipe system, and if I run a pipe to a radiator in the conservatory, would it not be best to put in a return pipe? In other words, to connect this radiator on the two-pipe plan.

ARCHITECTS AND THE ROOFING QUESTION.

From J. L., Peterstown, W. Va.—It seems to me that architects nowadays, with their pretty plans and beautiful pictures of houses, have little or no regard for the roofs of the buildings which they design. The roof of a house is certainly admitted to be, next to the foundation, the most important part of the structure. Now, with the complicated plans of attractive buildings, it seems to me that the rafters of the roof might be fixed so that the bulk of the rain will not run to the front of the house. Water barrels in such a location are unsightly and a cistern entirely out of place. The writer was recently called to do a job of spouting on such a building as described, and in order to make the work satisfactory, he had to put in more unsightly outlets and downfalls in front of the house than he would have done if the roof had been properly constructed.

At midnight on Saturday last the doors of the South Carolina Interstate and West Indian Exposition, Charleston, S. C., were closed. The exposition opened on December 1 last, and the enterprise in many respects was eminently successful. It is stated, however, that it will be a loss financially, and the stockholders will receive a very small proportion of their subscriptions back. The attendance was large, and the effect of the exposition on the city of Charleston is expected to be eminently satisfactory.

The ship "Lena" arrived in the port of New York a few days ago carrying about 7 tons of volcanic dust, which was used as ballast. Three weeks ago the "Lena" was at Barbadoes, preparing to start in ballast. It was at that time that the shower of dust and fine gravel from La Soufriere fell in the vicinity of the islands. The "Lena" being in need of ballast, the captain decided to use what dust fell on her decks for that purpose.

In order to combat the smoke nuisance the Prussian Government called together a committee for the trial of all smoke consuming apparatus, says the *Engineer*. This committee have finished their work, and common measures are about to be taken to remove the evil. It was proposed to institute schools where schools could be specially trained for the handling of steam boiler plants. The Steam Boiler Revision Association consulted most of the branch associations, and the result was that most of them were against the idea of the schools; but it was proposed to send properly qualified men to instruct the stokers employed in the various steam plants.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is quiet and about ¼c. lower.

Copper is unchanged and dull.

Pig Lead remains quiet and firm.

Spelter is scarce for spot and prices high and firm.

Antimony is unchanged.

Nickel is in good demand and without change in price.

Aluminum is firm and in good demand.

Tin Plates are quiet, with prices unchanged.

Sheets are very firm in price and in good demand.

Old Metals are fairly active and without change in price.

Foundry Iron is very scarce, with prices extremely strong and high.

Sheet Copper is in good demand, with prices firm.

Sheet Zinc is without change.

Hardware business is relaxing somewhat as season progresses; prices rule very firm.

Plumbers' Supplies are in good demand, with prices generally very firm.

Hot Air Registers are in active demand, with prices irregular.

Stove Boards are active and firm in price.

Screen Goods are getting scarce and prices rule very firm.

Wire Nails are moving in good volume at former prices.

Cut Nail prices have been reaffirmed for June; demand is moderate and supply rather short.

White Lead is less active, but firm.

Linseed Oil is fairly firm and without change in price.

Spirits Turpentine is ¾c. higher and quiet.

METAL MARKET.

NEW YORK, June 6, 1902.

Pig Tin.—Weakness in London was the feature of the Pig Tin market in the early part of the week, and prices here dropped in sympathy with those on the other side. The downward movement, however, was checked on Thursday, and a reaction in prices set in in this market, bringing them up again to within about ¼c. of those ruling at the date of our last report. The market closed firm and tending upward. Jobbers quote Straits Pig in small lots at about 31c. to 31¼c. per lb., according to quantity. Throughout the entire week business was quiet and dull. The deliveries for the month of May were very heavy, showing that a large amount of material is being delivered against old contracts. The total statistics for Europe and the United States, as compiled by the New York Metal Exchange, show:

	Tons.
Total visible supply May 31, 1902	17,018
Against visible supply April 30, 1902	15,596
Against visible supply May 31, 1901	16,991

Copper.—No developments of special interest have taken place in the market for Copper during the week. The consumptive demand continued light, purchases being largely confined to moderate sized lots for present requirements. Wholesale prices were somewhat easier at the close. It is said that the offerings of Copper for prompt delivery in this market are by no means heavy. This fact, however, has not operated to infuse any new strength into the market. Jobbers quote Lake Ingot in small lots at 13c. to 13¼c. per lb., and Casting Copper at 12¾c. to 13c.

Sheet Copper.—Manufacturers and manufacturers' agents report a continued brisk demand for Sheet Copper for current consumption. Some good sized contracts are said to have been placed for deliveries up to the end of next month. The consumption of Sheet Copper this season is considerably ahead of that of former years, and the outlook is favorable for a continuance of the present activity. Prices remain firm on the basis of 18c. per lb. for Sheet Copper from store.

Pig Lead.—There is no change in the market for this metal. The demand continues moderate and prices steady and firm at the figures ruling for some time past—viz., 4.45c. to 4½c. per lb. for American Pig in small lots.

Spelter.—The scarcity of spot metal continues in this market, keeping prices for prompt delivery at relatively high figures. Quotations, in fact, are more or less nominal at the present time. Producers are not offering freely nor are consumers showing any disposition to buy to any extent beyond their immediate requirements. The tone of the market at the close was very strong, good Western brands in small lots being quoted at about 5¼c. to 5½c. per lb.

Sheet Zinc.—The demand for Sheet Zinc is of the usual proportions and prices are firmly maintained at 6¼c. per lb. for 600-lb. cask lots and 6¾c. to 7c. for smaller quantities.

Antimony—Is unchanged. Hallett's in small parcels is quoted at 8⅝c. to 8¾c. per lb.; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—There is no change in the market for this metal. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues active and prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates is without any new feature worthy of note. New business is on a very moderate scale, while deliveries on old contracts continue liberal. The mills are coming up nearer abreast of their orders and fairly prompt shipments are now obtainable. The retail demand for Tin and Terne Plates in this market is rather spasmodic. Buyers continue to call for such quantities as they need for immediate or early future requirements and are not inclined to anticipate their wants. Prices are firm and without change. American Bessemer Coke Plates, IC, 14 x 20, in moderate sized lots, delivered at New York or corresponding points, are quoted at about $4.75 to $4.90 per box.

Sheets.—It is said that the large consumers of Sheets are now pretty well covered for some time ahead. Nevertheless, a fairly large demand for both Black and Galvanized Sheets continues. While deliveries are more liberal, the Eastern jobbers still complain of being unable to obtain the full assortment of Black Sheets that they need to meet the requirements of their customers. Some sizes in the heavier gauges of Black Sheets are quite scarce at the moment. Galvanized Sheets are not in such good demand as Black, but the mills are said to be pretty well filled up on old contracts for this material. Prices hold very firmly in view of the increasing cost of production, and as quite a number of the Sheet mills will close for a time during this and next month for inventory and repairs, reducing the output to a considerable extent, the outlook is regarded as decidedly favorable for continued strength in this market. Jobbers' prices are without change. No. 27 One Pass Cold Rolled Soft Steel Sheets are selling at about 3.75c. to 3.80c., and No. 24 Galvanized at 4c. to 4.20c.

Chicago advices are as follows: There has been but a moderate degree of activity in Sheets. The market has remained firm, with full prices obtained. Small lots of No. 27 Black Sheets from store are quoted at 3.45c. to 3.55c., and Galvanized Sheets at 4.70c. to 4.75c. for No. 27.

Old Metals.—Scrap Iron is fairly active and firm, and Old Metals of other descriptions are in moderate demand. Prices are firm, as a rule, and not quotably changed. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb.	10¼c.
Light and Tinned Copper	per lb.	9¼c.
Heavy Brass	per lb.	8¼c.
Light Brass	per lb.	6½c.
Lead	per lb.	3⅝c.
Tea Lead	per lb.	3¼c.
Zinc	per lb.	2⅞c.
Pure Aluminum Sheet	per lb.	22 c.
Cast Aluminum	per lb.	17 c.
No. 1 Pewter	per lb.	18 c.
No. 2 Pewter	per lb.	9 c.
Tin Plate Scrap, per gross ton	.... to	$5.00
Wrought Iron Scrap, per gross ton	$13.00 to	13.50
Heavy Cast Scrap, per gross ton	12.00 to	12.50
Stove Plate Scrap, per gross ton	8.50 to	9.00
Burnt Iron, per gross ton	7.00 to	7.25

◆

THE PIG IRON MARKET.

New York.—The market continues exceedingly bare of Iron and the quantities available for delivery at any time this year are becoming smaller and smaller. A moderate amount of Scotch Foundry Iron is being purchased right along for importation, but prices for good standard brands are mounting steadily. The high phosphorus of the Scotch Irons is troubling consumers, who are not accustomed to it. Quotations for summer delivery are as follows: Northern Iron, at tidewater, No. 1 X, $21.50 to $22; No. 2 X, $21 to $21.50; No. 2 Plain, $20.65 to $21. Tennessee and Alabama brands are quoted as follows: No. 1 Foundry, $21 to $21.50; No. 2 Foundry, $19.75 to $20.25; No. 3 Foundry, $18.75 to $19.

Chicago.—What new developments there have been in the Pig Iron market during the week have favored higher rather than lower prices. The demand has continued active and urgent, with relatively moderate offerings. Higher prices have been obtained for both late and nearby delivery, and resales for immediate shipment are from $2 to $3 per ton above quoted prices. Northern Iron is especially scarce. As the market reaches a higher level there is relatively less difference in the various grades, and the difficulty in giving reliable prices increases with the diminishing business. We quote as follows:

Lake Superior Charcoal	$23.00 to $24.00
Local Coke Foundry, No. 1	22.50 to 23.00
Local Coke Foundry, No. 2	21.50 to 22.00
Local Coke Foundry, No. 3	21.00 to 21.50
Local Scotch, No. 1	22.00 to 23.00
Ohio Strong Softeners, No. 1	24.00 to 24.50
Southern Silvery, according to Silicon	21.15 to 21.65
Southern Coke, No. 1	21.15 to 21.65
Southern Coke, No. 2	20.65 to 21.15
Southern Coke, No. 3	20.15 to 20.65
Southern Coke, No. 1 Soft	21.15 to 21.65
Southern Coke, No. 2 Soft	20.65 to 21.15

Philadelphia.—There is little to be said in regard to Pig Iron prices, except that they are liable to be almost anything within the next few days. The difficulty in getting supplies to the furnaces and the unsettled condition of labor make it reasonably certain that no improvement can be looked for until after midsummer, and perhaps a long time beyond that. We quote as follows:

No. 1 X Foundry	$20.50 to $21.50
No. 2 X Foundry	19.75 to 20.50
No. 2 Plain	19.50 to 20.00

Pittsburgh.—Pig Iron sales in the last few days have been light, on account of the strike at the blast furnaces in the Mahoning and Shenango valleys. Most of the large consumers of Foundry Iron are covered, but small lots of Northern No. 2 are held at $21 to $22, Pittsburgh.

Cincinnati.—The Pig Iron market at present is quiet, though it can hardly be said to be from the usual summer season causes. Almost all, if not absolutely all, of the Southern furnaces are temporarily withdrawn from the market. Under these conditions the quotation list becomes a matter of approximation, with a range of $16.50 to $17.50 for No. 2 Foundry, Birmingham basis. Buyers, in the main, appear to be taking matters philosophically, and while there is considerable more inquiry than there is Iron in sight to satisfy it, there does not appear to be anything of a panicky feeling regarding the situation. We quote, f.o.b. Cincinnati, as follows:

Southern Coke, No. 1	$19.75 to $20.75
Southern Coke, No. 2	19.25 to 20.25
Southern Coke, No. 3	18.75 to 19.75
Southern Coke, No. 4	18.25 to 19.25
Southern Coke, No. 1 Soft	19.75 to 20.75
Southern Coke, No. 2 Soft	19.25 to 20.25
Ohio Silvery, No. 1	21.85 to 22.35
Ohio Silvery, No. 2	21.35 to 21.85
Lake Superior Coke, No. 1	22.35 to 23.10
Lake Superior Coke, No. 2	21.85 to 22.35
Lake Superior Coke, No. 3	21.35 to 21.85

CHICAGO REPORT.

Scrap Iron and Steel.—A firm tone has prevailed for Scrap of all kinds, under a good demand and only moderate receipts. Stove Plate, however, has been more freely offered and is easier. We quote dealers' prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	.... to 13.00
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	10.00 to ....
Burnt Iron and Grate Bars	8.00 to 9.00
Sheet Iron and Hoops	8.00 to 9.00
Plow Steel	12.00 to 13.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	8.50 to 9.00
Turnings	12.00 to 12.50
Horseshoes	14.00 to 14.50

Old Metals.—A little firmer tone has been developed in Old Copper, in sympathy with new material, but prices have not changed essentially. Brass, Lead and Zinc have also ruled stronger at previous prices. Following are the prices paid by dealers in this market:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	10 c.
Copper Clips	11 c.
Red Brass	11¼c.
Yellow Brass	8½c.
Red Brass Borings	10 c.
Yellow Brass Borings	7½c.
Light Brass	7½c.
Pipe Lead	3.70c.
Tea Lead	3.35c.
Zinc	3 c.
Tin Foil	22 c.
Pewter, No. 1	19 c.
Pewter, No. 2	11 c.
Aluminum	20 c.

Old Rubber.—There have been freer offerings of Rubber Shoes, which are lower, but other kinds of Rubber are well sustained. The following prices are paid by dealers in this market:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7⅛ to 7¼c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6 c.
Black Rubber	....	4 c.
White Rubber	....	8½c.

Rags—Are freely offered and with only a moderate demand the market is slow and easy. Dealers are buying at 70c. to 75c. per 100 lbs., Chicago delivery.

Anthracite Coal.—There is a fair movement on old contracts, but little new business in this section. For the time being the supply is ample, but all depends upon the strike situation in the East. The following are the prices current, subject to a discount of 30c. per ton for shipments in June:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

◆

The Aluminum Foundry Company, Manitowoc, Wis., are doing a special foundry business in Aluminum Castings. They advise us that through many years of experience they have become thoroughly acquainted with the alloying of Aluminum, so as to give the metal any desired strength. The company manufacture Castings for automobiles, motor cycles, &c., and do experimental work of all kinds that can be made of pure Aluminum or its alloys. They also manufacture several novelties in Aluminum. The members of the company are Conrad Werra and Henry Stahl.

The Jeffrey Mfg. Company, Columbus, Ohio, are sending out a new catalogue of the Jeffrey Screens for screening all kinds of materials, including ash, coal, rock, coke, plaster, slate, ores, clinker, sand, &c. The catalogue is of 48 pages, profusely illustrated and excellently gotten up. It contains a list of important companies who are using the Jeffrey Screens, together with a number of testimonials from those who have tested them in operation.

THE HARDWARE TRADE.

With the entrance of the summer and the coming of warm weather there is a relaxing in the pressure of business as between the manufacturers and larger merchants. This condition is accepted as entirely normal and does not indicate any lessening of prosperity or any weakening in the tone of the market. Few manufacturers are in a position in which they are anxious at the present time to secure orders for future delivery. Many of them will be fully occupied for some time in clearing up their order books and accumulating even a fair stock with which to carry on next season's trade. Various influences are tending to keep prices steady and to give them, in a good many lines, something of an upward drift. The high price of material and its scarcity is an important influence in this direction. Wages are also in nearly all factories higher, gradual and individual advances taking place from time to time, while in some cases there have been specific increases in the remuneration of the workmen. The ease with which goods are sold also gives manufacturers confidence in maintaining prices, and they are thus enabled to realize better profits than has often been the case. There is an excellent business doing between the retail merchants and the jobbers or manufacturers from whom they draw their supplies, and their orders are frequent and for well assorted lots. Season goods are naturally in especial request. The wisdom of those who covered their requirements early in the year is finding illustration in many lines in which there is a good deal of trouble in obtaining goods at this late date. The number of those, however, who deferred buying is said to be comparatively large. A feature of the trade which deserves notice is the steady and large demand for Builders' Hardware, a line in which manufacturers find it difficult to execute orders promptly. The gradual broadening of the field covered by Hardware is receiving the practical attention of many alert and enterprising merchants who are considering the feasibility of adding to their assortment goods which are found to go harmoniously and advantageously with a Hardware stock. In spite of the large domestic demand export business continues in excellent volume. The losses in certain directions are, it is thought, fully made up by gains in others. The financial condition of the trade throughout the country is very satisfactory. Few failures are reported, and there is little serious complaint in regard to collections.

NOTES ON PRICES.

Cast Iron Pipe and Fittings.—The scarcity of some of the sizes of Cast Iron Pipe is beginning to cause considerable annoyance to the trade. The demand for 4-inch Iron Pipe, standard weight, has become so great during the past month that the leading concern in the line report that they are over a quarter of a million feet behind with their orders. They are running the plants to the full limit of their capacity, and yet they cannot keep up with the demand for the goods. The newer concerns in the business are reaping the benefit of the situation, which is giving the trade an opportunity to test the quality of the material produced by the independent makers, and consequently opening up for them new channels of consumption for their output. There is no change in price in view. The next meeting of the manufacturers will be held in July, and until that time present quotations are likely to rule.

Hot Air Registers.—The market for Hot Air Registers is in a somewhat unsettled condition. Some of the manufacturers are said to be quoting prices which, it is claimed, are unjustified by the condition of the market, and the general level of quotations is lower than it was a few months ago. It has been found impossible to maintain concerted action among the manufacturers of these goods, and many of them complain that at present prices the margin of profit on some classes of Registers is reduced to almost nothing. The volume of business is referred to as exceptionally good, which makes the weak condition of the market appear anomalous. Prices in the East rule about 5 per cent. higher than those in the Western part of the country. In view of the present condition of the Iron market and the growing scarcity of raw material, however, it is expected that the market for Registers will stiffen in the near future.

Expansion Bolts.—In regard to the combination of the manufacturers of Expansion Bolts, reference to which was made in these columns a few weeks ago, we are informed that options on various plants have been taken during the past few weeks in the interest of a Baltimore, Md., syndicate. M. Harper Steward of Philadelphia, who was instrumental in obtaining the various options, states that the idea of the syndicate is to form a company of as low capitalization as possible, and to base the same on the amount of Bolts sold during the past two years and the value received from the same. With the consolidation of six or more companies, it is calculated that the cost of manufacture would be decreased, and that with a decrease of about 10 per cent. in the discounts, enough profit would be secured to declare a fair dividend. Among those who have given options on their plants are Isaac Church, Toledo, Ohio; McCabe Hanger Mfg. Company, New York; D. C. Seaman & Co., and the Steward & Romaine Mfg. Company of Philadelphia, and the Phipps Mfg. Company of New York. It is expected that options will be closed at an early date, when the formation of the new company will be proceeded with.

Stove Boards.—Reports from the manufacturers of Stove Boards indicate an especially active demand for those goods. Prices are firmly maintained.

Screen Goods.—The demand for Screen Doors, Window Screens, &c., is referred to as about the heaviest ever known at this season. The manufacturers are rushed with orders and are all behind in their deliveries, some sizes being very scarce. Prices, under the circumstances, are naturally strong, and in many cases consumers are obliged to pay a sharp premium over quoted rates in order to secure early delivery of these goods.

Freezers.—A similar condition of affairs obtains in the market for Ice Cream Freezers, the demand for which considerably outstrips the supply. This is particularly the case with the more popular makes. Notwithstanding that the majority of orders for Freezers were placed unusually early this year, the demand upon the manufacturers shows no signs of abating. Prices are firm.

Wire Nails.—While a falling off in the demand for Wire Nails is noted, which, however, is not unusual at this season of the year, the retail business in these goods in New York is referred to as extremely satisfactory. Prices are without change, small lots of Wire Nails from store being quoted at $2.30 per keg.

Cut Nails.—At the monthly meeting of the Cut Nail Association May prices were reaffirmed for the month of June for domestic business and export prices were advanced 10 cents per keg. Complaint is still heard regarding the scarcity of Cut Nails, owing to the inability of the mills to procure enough Steel. The demand for Cut Nails in the New York market is moderate. Small lots from store are quoted at $2.30 per keg.

White Lead.—New orders for White Lead in Oil placed during the past week were not so heavy as of late, but deliveries on contracts are fairly active. There are indications that the usual summer quiet in this line is beginning. Prices are unchanged, small lots of White Lead in Oil being quoted at 6¼ to 6½ cents per pound.

Linseed Oil.—The local demand for Linseed Oil is confined to comparatively small lots. The market is fairly firm. It is reported to be easier to buy small lots than larger quantities at the latest quotations. Prices are unchanged, City Raw being quoted in a retail way at 67 to 67½ cents per gallon.

Spirits Turpentine.—The condition of the Southern Turpentine market continues strong, owing to comparatively light receipts. The local demand is moderate, buyers not being inclined to purchase beyond immediate requirements at present prices. Turpentine in small lots is quoted at 49 to 49¼ cents per gallon, being about ¾ cent above last week's prices.

Old Rubber.—The demand for Old Rubber is of moderate proportions. Dealers in New York and vicinity are paying about the following figures:

Car Springs, ton lots, per lb	5 c.
Rubber Shoes, less than carloads, per lb	7 to 7⅛c.
White Wringer Rolls, per lb	7⅛ to 7¼c.
Inside Bicycle Tubing, per lb	21½c.
Outside Tubing, per lb	6 c.

Agate Ware, &c.—Lalance & Grosjean Mfg. Company, New York City, issue on June 2 the following discounts from their revised price-list of Enameled Wares, dated November 1, 1901:

	Discount.
Agate Nickel-Steel Ware	50 and 20 %
Pearl Agate Ware	50 and 20 %
Blue and White Ware	60 and 15 %
All White Ware, Blue Border	50 and 20 %
Regal Steel Ware	60 and 10 %
Peerless Ware	70 and 10 %

TRADE NOTES.

The American Brass Mfg. Company, St. Louis, Mo., have increased their capital stock from $10,000 to $20,000.

An elaborate card is being sent through the mails by the Grasselli Chemical Company, Cleveland, Ohio, calling attention to the merits of their Eureka Soldering Flux.

The Pressed Steel Tank Company, Milwaukee, Wis., have been incorporated, with a capital of $100,000, to take over the business of the Seamless Tank Company of that city. Robert H. Hackney, F. G. Bigelow and G. Z. Markham are the incorporators.

The Houghton & Buxton Mfg. Company, Worcester, Mass., makers of Stamped Metal Goods, have taken the factory space formerly occupied by the W. H. Eddy Company, adjacent to the company's shops on Exchange street. The additional space will add 50 per cent. to the Houghton & Buxton Company's facilities, which was badly needed, the business having grown with great rapidity during the past year.

The Johns-Pratt Company, Hartford, Conn., manufacturers of Asbestos, suffered a $50,000 loss by fire at their plant June 3.

The Whiting Foundry Equipment Company, Harvey, Ill., state that the volume of business continues most satisfactory. They are spending $30,000 in tools and for additional room.

In a recent lecture in Philadelphia, Sir Robert Ball, the noted astronomer, is reported to have utterly discredited any idea of "talking with Mars." Sir Robert estimated that to signal Mars so as to be seen by a Martian astronomer who happened to be looking this way, using the wigwag system, we should need a flag 300 miles long and 200 miles wide, waved from a staff 500 miles long. Flashlight signaling he considers equally impracticable. If Lake Superior could be filled with petroleum and set on fire, the resulting blaze might be discerned as a speck of light, but not sufficiently prominent to suggest that anything unusual was in progress. He does not appear to consider electrical means worthy of discussion.

A correspondent of the *Foundry*, giving his experience with gas as a fuel for brass furnaces, says he has found that gas in any form is not the best fuel for melting brass in crucibles, as it destroys these to such an extent as to more than overbalance any gain which might be made with a cheap supply of this fuel. In his opinion nothing equals coke for real economy in the melting of brass.

The American Spiral Pipe Works, Chicago, have issued their 1902 catalogue, containing general and special information about Spiral Riveted Pipe, Connections and Fittings of special import to a large number of consumers. Spiral Pipe is recommended by the manufacturers for the following: Water mains, irrigation, hydraulic mining, water conduits, leader pipe, exhaust steam, smoke stacks, packing houses, blower pipe, suction pipe, discharge pipe, cold storage plants, sugar plantations, sugar refineries, hot air heating, air compressors, mine ventilation, building ventilation, tunnel ventilation, paper and pulp mills, railway water stations, &c.

McCarthy Brothers are building a new store and apartment house at 511 South West street, Syracuse, N. Y., and will occupy the store on the first floor as a plumbing and hardware establishment.

Kramer Bros.,
DAYTON, O.

A 62-PAGE PAMPHLET

Comprising a Series of Articles and Letters on *Chimney Troubles and Their Remedies* published under the title

Contains a compilation from the columns of THE METAL WORKER, of articles and correspondence relating to house chimneys, defective flues, and kindred topics, comprising a source of information of the most practical and reliable nature, on overcoming difficulties which occur in the working of chimneys, flues, etc.

To all who are interested in flues and drafts, in their relation to stoves, furnaces and house heating apparatus, this book will prove instructive and helpful.

The Contents are as follows

Page.

POINTS ON CHIMNEYS - 7–32
An illustrated article by J. L. Bixby, Jr., describing many details in chimneys, which cause trouble, and giving remedies. An important table is presented, of the sizes of chimneys required in dwelling houses, based upon the amount of work to be done.

DEFECTIVE FLUES - - - 33–35
This article presents information resulting from a wide, practical experience of the writer, and gives sound advice on some of the details of chimney construction.

HOW TO IMPROVE A WEAK CHIMNEY - - - - - 36–40

VARIOUS FORMS OF VENTILATORS or CHIMNEY TOPS 41–45

CONDENSATION IN STOVE PIPES - - - - - - 46, 47

SMOKE PIPE FOR WOOD FURNACES - - - - 48

REMEDYING DOWN DRAFT IN CHIMNEY - - - - 49–51

CONNECTED FLUES DESTROY DRAFT - - - - - - 52–55

FAILS TO BAKE ON BOTTOM 56–62

40 good Illustrations help to make the Text clear.

PROVIDENCE, R. I.

Galvanizing and Tinning.

A Practical Treatise on Coating with Tin and Zinc, with a Special Chapter on Tinning Gray Iron Castings. By W. T. Flanders. Size 5½ x 8 inches. 93 pages, 40 illustrations. Cloth bound. Price $2.00.

The author of this work has made a specialty of galvanizing and tinning, and has been employed to erect plants in various parts of the country, also to instruct the owners, so that, in all instances, they have been able to operate them successfully. The subject of galvanizing is, therefore, treated from the standpoint of an expert and in a practical manner. The selection of materials and apparatus for erecting plants of large and small capacity is treated, together with instructions for their equipment and accompanied by many illustrations of the plants and of the tools and appliances. Plain directions are given for the preparatory treatment of metals and articles to be coated, and every detail which is of importance in successfully applying to metals a secure and attractive coating is described. The tinning of articles is treated in the same practical manner. The difficulties found by many who have attempted to tin malleable and gray iron castings are explained and methods for doing the work made simple.

CONTENTS.

Galvanizing.

Locating a Plant and Selecting a Kettle.
The Galvanizing Room.
Tanks for Acids and Other Purposes.
Tools for Galvanizing.
Filling and Firing a New Kettle.
The Use of a Pyrometer.
Materials Used in Galvanizing.
Building and Setting Kettles.
Removing Scale with Sulphuric Acid.
Cleaning Sandy Castings with Sulphuric Acid.
Preparing the Work for Dipping in the Zincing Bath.
Drying the Work.
The Heat of Zinc.
Dipping the Work in the Molten Metal.
The Formation of Dross in the Kettle.
Running Over, or "Sweating," Zinc Dross.

Tinning Malleable Iron, Wrought Iron and Steel.

Preparing the Work.

Iwans' Perfection Wire Conductor Pipe Hanger.

Best Hanger Ever Invented.

Why It Is The Best:

1st. It holds pipe one inch from building to permit painting.
2d. It looks ornamental.
3rd. It can be used for frame or brick buildings.
4th. It can be used for round or corrugated pipe.
5th. It completely encircles the pipe, holding it firmly on all sides.
6th. It is strong and durable.
7th. It is cheaper than any other hanger.
8th. A tinner can put up more pipe in less time than with any other hanger.

The hanger can be tightened as desired by giving the eye a twist. For 2-inch corrugated pipe 2½ inch hanger is required. Other pipe runs uniform.

Also Manufacturers of Iwans' Chimney Top.

How to Make the Best Roof

M F Roofing Tin is the first requisite; capable work the second—that is all—except, the roof will last 50 years. The manufacturers of M F Roofing Tin have lately published a complete manual of roofing and roofing material which will be sent free to anyone interested in roofs.

MF Roofing Tin

is made entirely by hand labor—the "old-style" process. It has the heaviest coating of pure tin and new lead—impervious to rust or atmospheric gases. Ask your roofer—or for a copy of the book,

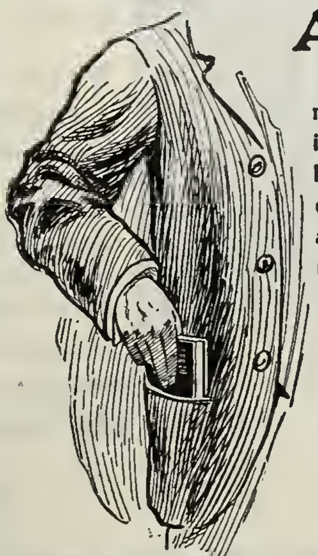
TINSMITHS HELPER and PATTERN BOOK

WITH USEFUL RULES, DIAGRAMS and TABLES

= By H. K. VosBurgh =

NEW AND IMPROVED EDITION



A USEFUL handbook for tinners and other mechanics, treating simple problems in pattern cutting, such as are of daily occurrence in the shop. An elementary manual for the young tinsmiths A handy reference for all sheet metal workers.

120 Pages
53 Figures

An Invaluable Pocket Companion **$1.00**

Section 1 ❧ Pages 1-66
Diagrams and Patterns

Demonstrates in a simple way, and by means of illustrations and descriptive text, about 50 examples of sheet metal pattern work, such as the method of cutting can breasts, flared tinware, scale scoops, oval boiler covers, lips for measures, elbow patterns, &c.

Section 2 ❧ Pages 69-88
Epitome of Mensuration

Compiled with regard to the requirements of the tinner, describing how to find the area of a circle, the circumference of a circle, the contents of a sphere, a cylinder, a cone, and other information relating to the work of a tinsmith.

Section 3 ❧ Pages 89-120
Tables, Rules, Recipes

Gives tables of the weights of sheet metals, including the weight of black sheet iron, sheet lead, and galvanized iron sheets with their dimensions; the weight of lead pipe per foot; the weights of tin plates, sheet copper and sheet zinc. Several pages are devoted to tables giving the areas and circumferences of circles, the capacity of cans, the number of barrels in cisterns and tanks, sizes of tinware in form of frustum of a cone, &c., and practical receipts, including mixtures for solders of different kinds, soldering fluxes, and various cements.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

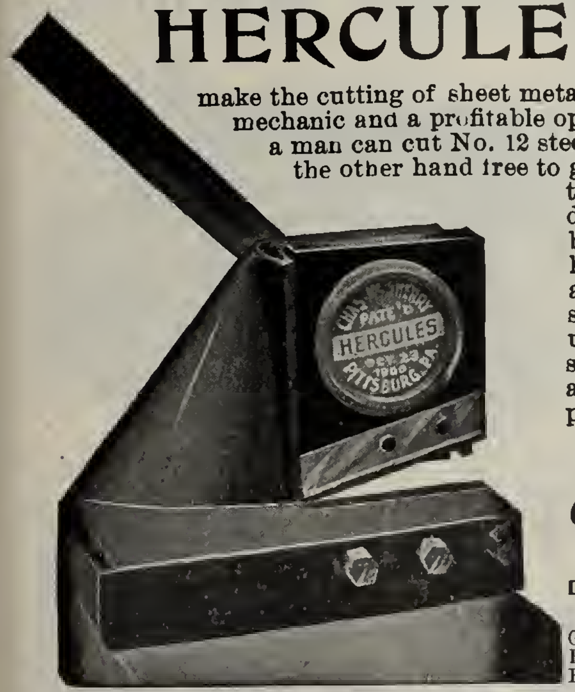
97 inches long.



HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

★ SAWS ★

Our Star Hack Saws are now used in nearly all Iron-working Shops the world over. They are equally useful for farmers and men in all departments of life. They will cut iron and wood equally well A nail does not dull them at all. One blade, which costs five cents, will cut off an inch square bar of iron 200 times without sharpening. We have cut off such a bar 337 times with one blade. All hardware dealers will furnish these saws. If not, we will send one steel frame and six blades by mail, prepaid, on receipt of $1.00.

All good blades are stamped with a ★

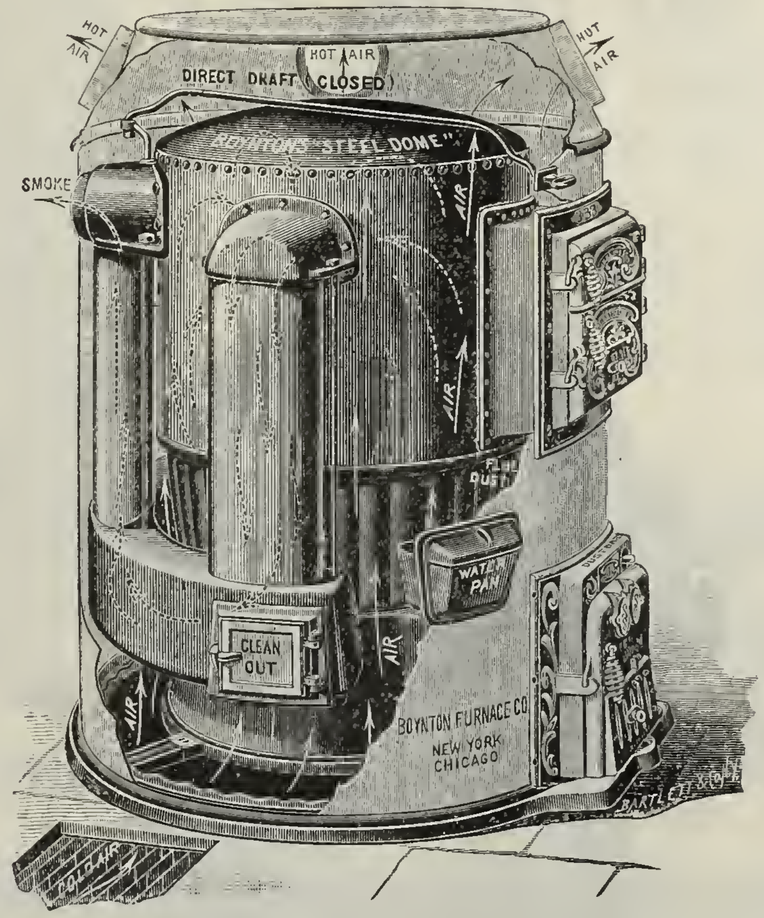
BOYNTON'S

New Steel Dome Furnace,

FOR HARD COAL OR WOOD.



A Special Grate is Furnished for Burning Wood.

The best example of the down draft type of wrought metal furnace in the market.

This form of furnace has the advantage of an unusually large combustion chamber ; which presents to the air in circulation a great area of direct heating surface. Very extensive additional radiating surface is comprehended in the two downtake flues at the side, the "horse-shoe" flue at the bottom and the up-take flue at the back ; through all of which the hot gases of combustion must pass when the direct draft damper is closed.

The general excellence of **Boynton Furnaces** in the matters of spacious ashpits, door mountings, absence of complications, modern design, etc., is maintained in this furnace.

The wrought metal work is made of heavy gauges of the best steel plate, with the most thorough workmanship, leaving no possibility of a leakage of gas.

Catalogue will interest you.

Burn Hard or Soft Coal or Coke. Large Doors

Some Ripe Experience

Has come to us through watching the doings of dealers throughout the United States.

We find that the dealer who sells cheap furnaces not only loses ground in the furnace business but also has a falling off in his other lines.

On the other hand, we can say that the man who sells a good furnace and charges enough to do a good job will, in a few years, be the leading furnace man in his town and at the same time build up his other business.

The ***American Furnace*** is made for the better class of trade; is durable, clean and economical in fuel.

The American Furnace Co.,

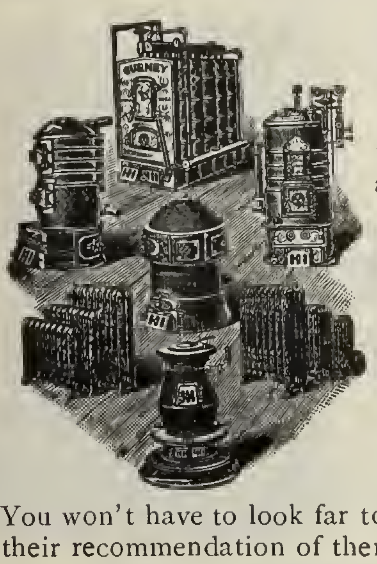
Bergstrom Bros. Co.

NEENAH, WIS.



Perfectly Natural.

A keen observer recently remarked that what displeased him most was to see people try to be what they are not. You're seemingly obliged to sell some apparatus on that basis, but never

"GURNEY" HEATERS,

BRIGHT IDEA DORIC and 400 SERIES,.

You may claim what we claim for them in the fullest confidence. It's never necessary for you to stretch their efficiency, their durability, or their economical fuel consumption. It's never necessary to make any misstatements about their ratings, for each heater is honestly rated and will do exactly what we claim for it. "Gurney" Heaters, by the way, are sold, not on "saying" but on "doing." You won't have to look far to find people right in your locality who'll help you sell "Gurney" Heaters by their recommendation of them. Write for latest catalogue and agents' particulars.

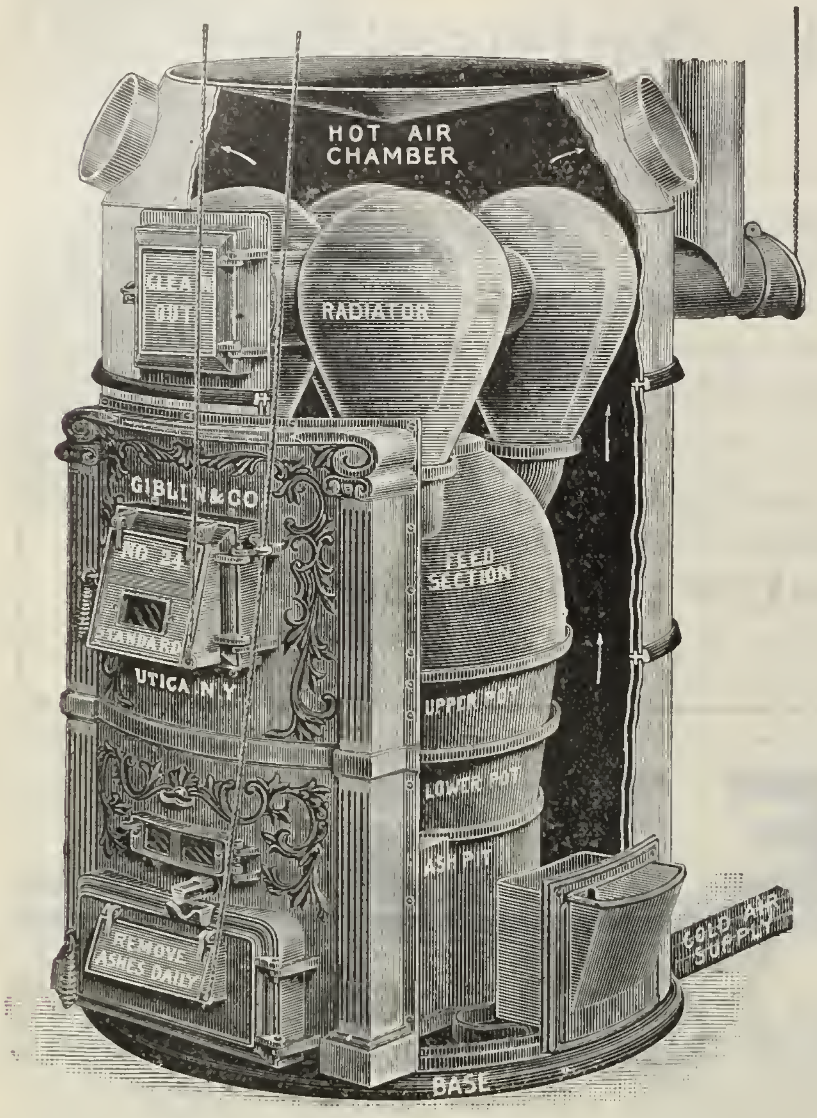
Philadelphia and Baltimore.



WORK WELL DONE AT LITTLE COST.

SOMETIMES

a furnace costs little but makes up the cheapness in the quantity of coal it consumes; sometimes a furnace costs a great deal and the extra cost is made up by the saving of the fuel; sometimes a furnace costs a moderate price and does the work well and saves fuel.

A FURNACE

of the latter class is shown herewith, and our catalogue shows it more thoroughly.

Here is the experience of one man with this style of furnace:

L. J. CLARK, Villas, Pa., says:

"I want to tell you how my furnace acted one winter. Down stairs I heat 3 rooms and pantry and hall, using a gasoline stove for cooking; upstairs, I heat 3 bedrooms, bathroom and hall, and also have one register in attic which was used occasionally, making in all 10 registers I moved into the house on the fourth of November and had fire up to the 5th of May. I bought 8 tons of soft coal at $1.80 per ton, total $14.40. I had about 1¼ tons left over. We had loads of hot water heated in furnace, so that fuel for gasoline stove only cost about $2.10. This looks rather small for expense, but nevertheless it is a fact."

THE PATRIC FURNACE

IS A COMBINATION OF

GOOD THINGS

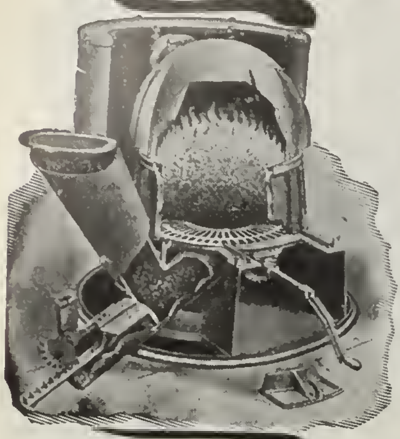
For the Dealer and User.

Scientific and Simple in construction. The Coking and Smoke-Burning is a trade-winner. Very economical. Has an efficient Hot-Blast. Exceedingly durable. A success for 29 years. Easy to sell. Easy to operate. Easy to install.

Let us send you a catalogue that tells you all about it.

The Patric Furnace Company,

SPRINGFIELD, OHIO.



IF YOU ARE NOT SELLING THE

Peck-Williamson Underfeed Furnace

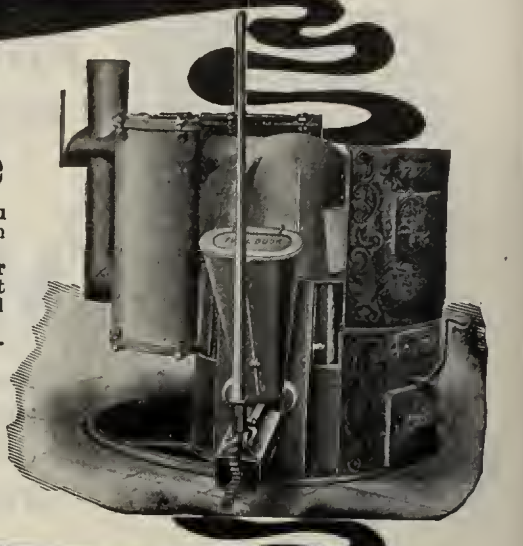
you have not the trade and are not making the money you might. Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

THE PECK-WILLIAMSON COMPANY,
CINCINNATI, OHIO.



For a swell job

You ought to know our line—many a dealer loses an opportunity to make a good profit because he knows only heating stoves and furnaces.

We can post you concerning steam and hot water heating, so you can get a share of what is due you.

KEWANEE BOILER COMPANY

KEWANEE, ILLINOIS.

Most all Furnaces have some good features; the principal difficulty the consumer generally has is to determine which may be the most durable and economical in fuel.

We guarantee the "DIGHTON," under proper management, to last as long without repairs as any Furnace made.

We, nor anybody else, couldn't make a Furnace to heat a given number of feet of space with any less fuel than the "DIGHTON" would require, even if the cost was five times what we charge for the "DIGHTON."

The "DIGHTON" price is just about one-third less than what you probably pay for some Furnace not one-half as good.

DIGHTON FURNACE CO., Taunton, Mass.

Furnace Heating.

A Practical and Comprehensive Treatise on Warming Buildings with Hot Air, by William G Snow, with an Appendix on Furnace Fittings. 170 pages; size, 6 x 9 inches. Cloth bound. Price, **$1.50.**

This is the only book that has been brought out which presents a systematic and reliable treatment of the warm air furnace system of heating.

It deals with the various types of furnaces, their construction, proper location and setting, together with furnace fittings, and all matters pertaining to the installation of furnaces and to effective and economical heating by warm air. The subject is discussed for the first time by a competent author possessed of a scientific education and a practical training, who presents positive rules, based on a long experience, for guidance in designing furnace systems for dwellings and other buildings where this popular method is employed. The various details of furnace work are described simply and at such length that the volume will be valuable to all who are in any way interested in the subject. It is recommended to practical furnacemen, to architects, builders and house owners, and to tinners and plumbers in suburban sections who do furnace work. To all these it will prove a reliable text-book and guide.

PARTIAL SUMMARY OF CONTENTS BY CHAPTERS.

Chapter I.—Furnaces—Is devoted to Furnace Construction—The Relative Proportion of Furnace Parts—Secondary Heating Surface—Economy and Efficiency—Heating Capacity and Exposed Wall Surface—Manufacturers' Ratings of Their Own Productions, etc.

Chapter II.—House Heating—Compares Furnaces and other apparatus, and describes Method of Setting Brick and Portable Furnaces—Location and Area of Cold Air Supply—Cold Air Rooms and Air Filters—Return Ducts and Air Circulation—Size of Hot Air Pipes—Location of Registers, etc.

Chapter III.—The Combination System—Discusses Heating Distant Rooms with Radiators—Balancing the System—Location of Water Heater in Furnace—Capacity of Water Heaters—Size of Radiators, etc.

Chapter IV.—Air—Deals with the Necessity of Ventilation—Water Needed to Moisten Air—Expansion of Air—Velocity of Air in Tubes, etc.

Chapter V.—Heating and Ventilation of Buildings—Considers the Size of Furnaces Required—Fresh Air Room and Supply—Air Circulation—Size of Flues—Use of Stack Heaters—Size of Heating Coils in Vent Flues, etc.

Chapter VI.—Heating of Public Buildings, Churches and Stores—Is given to the Size of Furnaces Required—Grate Surface in Ventilated Buildings—Air Supply—Size of Heating and Ventilating Flues—Size of Stack Heater, etc.

Chapter VII.—Fan-Furnace Combination System—Is devoted to Positive Warm Currents from Fan Systems—Location of Fan and Driving Apparatus—How Good Furnaces are Aided by Fans—Types and Efficiency of Fans—Area of Ducts and Flues, etc.

Chapter VIII.—Temperature Control.

Chapter IX.—Estimate and Contract Blanks.

Chapter X.—Value of Fuels. The Proper Size for Furnace Chimneys—with tables.

APPENDIX.

Furnace Fittings.—A section of 45 pages dealing with the Making of Furnace Casings—Metal Cold Air Boxes—Making Furnace Bonnets and Collars—Making Pipe and Elbows—Register Boxes and Stack Shoes, etc.

Practical
Gas Fitting.

Two illustrated articles describing How to Run Mains, Lay Pipes, and Put up Gas Fixtures.

116 Pages, 54 Illustrations, 5¾ x 8 inches, Cloth, Price, $1.00.

This is a concise and practical manual on the *best methods of doing gas fitting.*

It fills a need experienced by American mechanics for a handbook giving *plain and simple instructions* in this important department of plumbers' work.

The book consists of two accounts, both by expert gas fitters.

Each account is complete in itself, and as they treat the subject quite differently the book will be found more particularly valuable and complete.

The numerous illustrations help to show how many things are done which are difficult to describe in words alone.

This manual is, in short, well adapted to the practical requirements of plumbers and gas fitters.

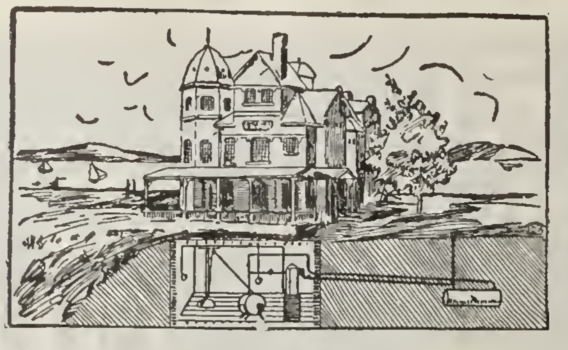
TABLE OF CONTENTS.
FIRST ARTICLE.

Introductory,
The Distillation or Manufacture of Coal Gas,
The Distribution of Gas from the Gas Holder Through the Town,
Connecting the Meter in Buildings,
Inspection of Material and Work,
Laying Out Pipe,
Gas Fitters' Tools,
Piping the Building,
Measuring Pipes,
Cutting the Pipe,
Finding Leaks,
Putting Up Fixtures,
Gas Logs,
Economical Gas Burning.

SECOND ARTICLE.

Introductory,
Locating the Lights,
Locating the Meter,
Making the Plan,
Getting Out the Pipe,
Piping the House,
Gas Fixtures and Fittings,
Piping Old Houses,
Frozen Gas Pipes.

SENT, POSTPAID, ON RECEIPT OF PRICE, BY
DAVID WILLIAMS COMPANY,
PUBLISHERS,
232-238 William St., New York.



Our remarkable recent inventions enable us to offer the public an intensely brilliant, smokeless gas at much less cost than city gas, better, safer, and cheaper than electricity, and costing but one-fourth as much as acetylene. Most durable and least expensive apparatus to maintain in effective perpetual operation. Gives services of lighting, cooking, and heating, and operating pumping engines. Fullest satisfaction guaranteed, and easy terms. The very apparatus for suburban homes, institutions, etc. We construct special apparatus also for fuel gas for manufacturing, producing gas equivalent to city gas at 50 cents per 1,000 cubic feet, and made to respond to very large demands; also for lighting towns, etc. Cooking by gas rescues a person from the intolerable heat experienced with other stoves. *Send for Catalogue.*

Satisfactory Conditions in the Heating Trade.

The heating industry has been remarkably free from annoyances for a number of years, and those identified with it are to be congratulated on the harmonious relations which exist between the manufacturers and the contractors. Beyond question this has been largely due to the tactfulness of the officers selected by the associations of manufacturers and contractors. Meetings of both these bodies have been held in Atlantic City this week, and their deliberations have been marked by the same wise conservatism which has characterized their policy in the past, while the reports of their officials and committees indicate that they are in a flourishing condition. The pleasant relations enjoyed in this trade are largely due to the generous spirit in which infringements are treated. The steam fitters have occasionally been called upon to take action where some house, eager to sell, have disposed of goods in a manner inimical to the best interests of the whole trade. In preference to attempting the infliction of a penalty for these violations, efforts have been expended in explaining how such a method of trading is an injustice to the great majority of the trade, and the endeavor has been made to secure an agreement to discontinue such practices. The result has been that the National Association of Steam and Hot Water Fitters has proved very successful and useful to its members.

While the meetings of the manufacturers have been held regularly and for a somewhat different purpose, the benefit to the whole trade has been marked. At their earlier meetings their energies were devoted to the elimination from the trade of many injurious practices, such as long terms, consignment of goods and other concessions which paid a poor return upon the capital invested. For some time past the conservative element in this body have endeavored to preserve a steady market, and it is worthy of note, as a result of this effort, that boilers and radiators have held to practically unchanged prices so far this year, notwithstanding that the prevailing conditions would have justified a change. Iron has advanced in price, wages have been increased and all the supplies which enter into the construction of heating apparatus cost more than formerly. Yet this body of manufacturers have felt that enough benefit would be derived by all from a practical uniformity of price to ultimately equalize the advantages and disadvantages.

The Strike Epidemic.

Labor troubles are increasing in number and importance. The forebodings of those who expected developments of this character are thus being verified. The indications of uneasiness on the part of labor early in the year were regarded as too significant to be misunderstood. Nevertheless, many experienced business men permitted themselves to be deluded by the belief that the strikes of this year would be neither serious nor numerous. They probably reasoned that too many of the recent strikes had resulted unfavorably to labor to warrant any extensive disturbance to occur at this time, or that workingmen were too generally employed at good wages to feel sufficiently discontented to strike in any great number. When the anthracite coal miners' strike was threatened the expressions of the over-sanguine had far more weight with the public than the positive utterances of the leaders of the miners. Hence that strike came as a surprise to the business world generally. It is entering upon its fifth week, with no more hope of an early ending than that based upon an investigation of the causes leading up to the strike by the United States Commissioner of Labor.

We now have troubles with the machinists in several localities, the strike of the puddlers in Eastern Pennsylvania, the stoppage of work by the melters in crucible steel works and, of course, more or less controversy with molders in scattered localities. The strike of the blast furnacemen in Ohio and Western Pennsylvania, although of short duration, was of greater extent than had been anticipated. The teamsters' strike in Chicago, settled last week, was a sudden outbreak which was far more serious in its consequences than could possibly have been foreseen. This week we have the strike of the coal miners in Virginia and West Virginia as an additional cause of uneasiness in manufacturing circles. A street railway strike is in progress in Providence, and a very extensive one in Chicago was last week barely averted. It is to be hoped that all the labor troubles now progressing will be settled before any more develop to distract business interests. The air, however, seems to be charged with portentous indications in this direction, and it would not be surprising if more and more labor troubles should break out before the epidemic has run its course.

Pig Iron Production Temporarily Reduced.

The monthly blast furnace statistics of *The Iron Age* for June 1 reflect the special conditions prevailing in the pig iron industry at the end of last month, through the banking and blowing out of a number of furnaces in the Shenango and Mahoning valleys, owing to the labor troubles in those regions. These troubles, however, were only temporary, and the majority of the furnaces have since resumed. Their suspension, however, in the last days of May was sufficient to make quite a sharp reduction in the active furnace capacity on June 1. The statistics referred to show a total weekly capacity on June 1 of 344,748 tons, as compared with 352,064 tons on May 1. It is probable, however, that the output for the coming month will be fully up to the 1,500,000-ton mark. It reached 1,570,243 tons in May, a month of thirty-one days. The report of furnace stocks of pig iron on June 1 shows a still further reduction to the insignificant amount of 62,616 tons, just about one day's output of the furnaces. Spot iron still continues exceedingly scarce, and higher and higher prices are being paid for it. Steel is also very scarce, and it looks as though this country will have to import for some time to come.

A Word to the Stove Dealer.

While the stove dealer at the present time is doing a particularly satisfactory business in gas and oil stoves, there is substantial basis for the conclusion that he is not neglecting his coal stove business. Those dealers who recognize that the more stoves are sold the greater the profit, while devoting a portion of their sample floors to the gas and oil goods, have been wise enough to make an attractive display of the cooking range or heater which they intend to use for a leader. If a fine piece of goods, which reflects credit on the dealer who makes a selection of it, is kept bright, clean and attractive, not only in all its parts but also in its surroundings, it will, instead of losing its attractiveness by being continually seen, grow upon the prospective purchaser. So, the dealer who expends a little extra care and makes the necessary effort to show either a cooking stove or a parlor heater, in season and out of season, under the most favorable conditions, is sure to secure the lion's share of the trade. It cannot be too strongly urged upon those who handle this class of goods that the stress of the summer weather and the demands made upon them by other branches of their business should not be permitted to cause any relaxation in the effort to push their coal stove business. It is only necessary for the stove dealer to walk through the streets of his own town or city to find that the buyers congregate around those stores which show their goods most attractively, and where the proprietor and his assistants meet all inquirers genially. If he would enjoy similar patronage it will only be necessary for him to adopt similar methods.

Our Export Trade.

Exports of manufactures from the United States show a decided improvement in the record of foreign commerce for the first ten months of the present fiscal year. The report of the Treasury Bureau of Statistics of the exports from the United States during the month of April and during the ten months ending with April 30 shows a marked improvement in the record of manufactured articles exported. This class of exports in the month of April, 1902, were $4,500,000 greater than those of April of the preceding year, being $38,960,000, against $34,416,000, and forming 36.5 per cent. of the total exports in April, 1902, against 29.1 per cent. in April, 1901. For the ten months ending with April the exports of manufactures were $333,820,000, against $339,307,000 for the corresponding months of the preceding fiscal year, a reduction of about $5,500,000 for the ten months. This would indicate that the total exports of manufactures during the full fiscal year, which ends with the present month, will fall little, if any, below those of last year. An examination of the details of the exports shows that the small reduction of $5,500,000 existing on May 1 was due entirely to a falling off of nearly $8,000,000 in the exports of pig iron and steel rails and of $3,000,000 in copper exports. As a matter of fact, the exports of all other classes of manufactured products are well up to the level of the preceding year, and in many cases in excess.

It will often be found a great saving of time and trouble if tradesmen, when sending an order to a house with which they have had no previous transactions, would inclose references with the order. As it is, considerable time is sometimes lost in shipping goods through the fact that the house from which the goods are ordered has either to write back for the necessary references or make inquiries through the commercial agencies as to the standing of their would-be customers. It sometimes happens that a reliable business house is not rated by the agencies, owing to recent organization or a change in the composition of the firm, and valuable time is occasionally lost while the agencies are making the requisite investigations as to the standing of the firm. If goods are needed in a hurry it will be found especially advantageous to send references the first time.

The Production of Coal in 1901.

The United States Geological Survey has prepared a preliminary report upon the production of coal in the United States in 1901, based upon returns representing 97 per cent. of the entire output. These returns show that 292,240,758 short tons of coal were mined in this country during the past year, the value of the output being placed at $348,813,831, as compared with 269,881,827 short tons, worth $306,891,364, mined in 1900. This represents an increase of 8 per cent. in quantity, and of 13.6 per cent. in value. The production of Pennsylvania anthracite showed a phenomenal increase, from 51,221,353 long tons in 1900, to 60,242,560 long tons in 1901, a gain of 17½ per cent. This is the largest percentage of gain made by the anthracite trade in 20 years. The average price for marketing anthracite coal was $2.05 per ton, the highest figure paid since 1888. Of the 27 States producing coal in 1901, all but four—California, Montana, Tennessee and New Mexico—showed increased production.

To Rival Niagara.

Several large water appropriations recently made upon the north fork of Feather River disclose the object of the late purchase of some 13,000 acres of swamp lands in the Big Meadow and Butte Valley basins, in North Plumas County, Cal. It is intended, says an exchange, to convert these basins into great storage reservoirs, and by about 10 miles of canal and tunnel to convey the water to the canyon of Mosquito Creek, where, with a vertical fall of 1600 feet, it will be dropped again into the Feather River. Here, it is reported, will be located the largest electrical transmission plant in the United States, save that of Niagara, and capable of generating upward of 300,000 horse-power. The Big Meadows basin of 11,000 acres will have the greatest capacity of any artificial storage reservoir known. In addition to developing the mining and lumber interests of this mountain region, as well as other industries along the route, this power will be carried to San Francisco—a distance of 175 miles. This project represents a movement in sympathy with the large efforts now being put forth in San Francisco and the interior to obtain new men and new capital for the development of the resources of Northern California.

Natural gas is being put to a new use at Sherryvale, Kan., where it is found in such abundance that its surplusage is employed to give the alarm when help is needed in putting out fires. In the center of the town a deposit has been struck of such force that it has been connected with a pipe, at the end of which is placed a large whistle, such as is usually blown by steam power. The whistle is used in place of a fire alarm bell, as it gives a blast which can be heard for miles round when it goes into action. The force of the natural gas works the apparatus equally as well as steam, and no expense is required for a boiler or fuel to generate the steam power.

Stove Manufacturers' Interests.

The stove manufacturers throughout the country retain pleasant impressions of their visit to New York in attendance at the national convention. There can be no doubt that all present at that meeting were benefited by the interchange of ideas, and even though on their return home many things occupied their attention, they have not yet become so engrossed in the details of their business as to have lost the new enthusiasm which was acquired at their annual meeting. They, doubtless, are in a position to take a broader view of the conditions which confront them, and are prepared aggressively to take hold of new methods for increasing the output of stoves. To be better able to accomplish this result a full acquaintance with the influences that tend to reduce the sale of stoves must be understood.

CONSOLIDATION.

The discussion of the different consolidation schemes has been beneficial in one respect, if in no other, and that is in making every stove manufacturer realize more nearly the true value of his location, permanent plant, its equipment, the availability of his various patterns and the popularity of his productions. He has doubtless also a better conception of the necessity of careful, systematic accounting and business methods, or an incentive has been given to become as thoroughly informed on these topics as some of those who suggested that these matters would have to be adjusted before consolidation could be perfected. With the busy season advancing ample opportunity is afforded for the closer scrutiny of cause and effect as bearing on the requirements of a successful stove manufacturing business. That consolidation was not accomplished was not due to the lack of favorable consideration, as stanch support was given it, and that further action has been postponed until November does not mean that interest in it has ceased, but that, like all great undertakings, time is one of the essential elements to its accomplishment. Hence the matter is to be regarded as simply in abeyance. The persistence with which consolidation is kept in view, despite severe criticism and the apparent impossibility of effecting such a combination of interests as will satisfactorily meet trade conditions in important stove consuming centers, is causing the movement to be regarded with much more respect than in previous years. Although the trade at large are of the opinion that no consolidation of stove manufacturing establishments can be effected that will include any considerable number of the large companies, yet the standing of the men who are pushing the latest scheme is so high in every respect that their efforts cannot be wholly ignored.

THE OUTLOOK.

Reports from all sources indicate that the sale of stoves this year will compare very favorably with the number which each manufacturer hopes to reach. Order books have already been well filled, and the trade generally seem to be reconciled to the advances which have been made and which must be made to bring in a satisfactory return for the investment and enterprise. Notwithstanding this pleasing immediate outlook, a further examination into conditions will show that there are other things which stove manufacturers must take into account when a period of years is to be considered. One of the immediate disturbing features that may or may not affect extensively the sales of the year is the coal strike, and another is the approach of the hot season. These two things conspire to induce many who have heretofore hesitated about the purchase of gas or oil cooking apparatus with which to equip their kitchens. Should the public change from the coal range to the gas range to any considerable extent both the coal range manufacturer and the stove dealer will feel the effect. It may be pointed out, however, that the tonnage of the castings of this branch of industry will be but slightly affected, although there will be a change in the amount of metal melted, pleasing to the gas range manufacturers. Another development that must surely in time make inroads upon the production of stove foundries is the number of small towns in which the exhaust steam from electric lighting stations is being used in street mains for heating buildings. Wherever a building is heated by means of radiators it cuts out the use of the hot air furnace or several heating stoves. These conditions have been gradually coming along, and while the more enterprising stove manufacturer has not had his output especially affected by them, it is due to his greater carefulness, more pleasing and attractive goods, and the fact that he has kept up his sales by winning customers from his less wide awake competitors.

NEW SELLING METHODS.

To repine over disagreeable conditions would be a waste of time, and to maintain the output and take care of the increased capacity of manufacturers only needs the adoption of some new methods. The stove manufacturer must realize that very few dealers have sufficient stove trade to occupy their entire time throughout the year; that the sale of stoves is practically over in the short space of three months, so far as the rush business is concerned; that it extends somewhat further in a desultory way is true, but not to such an extent as to maintain the establishment without the more active attention of the proprietor to plumbing, sheet metal work, or to some other lines of business which make drafts upon his enterprise and energy. Under such conditions the stove making industry must suffer if the exploiting of new fields or the maintenance of sales is left entirely to the stove dealer. Some stove houses do a great deal of advertising, and much of the time of their salesmen, who are especially selected for the purpose, is devoted to refreshing the memory of the stove dealer as to what must be done to secure his full share of the stove trade in his territory and giving him new ideas for increasing his sales. A more concerted effort on the part of stove manufacturers to the same end is necessary for the best interests of the industry. Local stove dealers must be induced to utilize the methods of manufacturers who have made inroads in their territory, selling direct to consumers. In many kitchens of every section of the country the cooking apparatus is dilapidated beyond what the man of the house would tolerate if he had to use it, and the methods of the steel range peddler can be followed with advantage by bringing to the attention of the family a stove suitable to their requirements. Stove dealers in many instances are not qualified to plan such a campaign for extending sales, and many who could do it will hesitate about such a step unless urged to take it, and explanations must be made which will enable them to see the profits that are likely to follow it. Others must be provided with instructions to qualify them for such work and aid them in carrying it out. There is still beyond the reach of the gas companies much territory where coal and wood stoves will be used for years to come, and to increase the sales in such territory and to hold the sales up to the old standard in the older territory will need consideration by the stove manufacturers to develop some plan for a concerted effort to aid the stove dealers in cultivating their fields of operation more thoroughly and to get all out of them that can be had. The gas companies in many large cities not only advertise freely in the daily papers, but circularize the town, have very attractive showrooms, give gas cooking exhibitions, in order to draw citizens to investigate them, and send out on clear days a horse equipped with bells and hitched to a suitable display wagon, on which one of their most attractive gas ranges is displayed. The gas companies in laboring to increase the sale of their product are at the same time doing efficient service for the manufacturer of gas ranges. Stove manufacturers could, with advantage, take up the exploiting of their new productions in a similarly effective way.

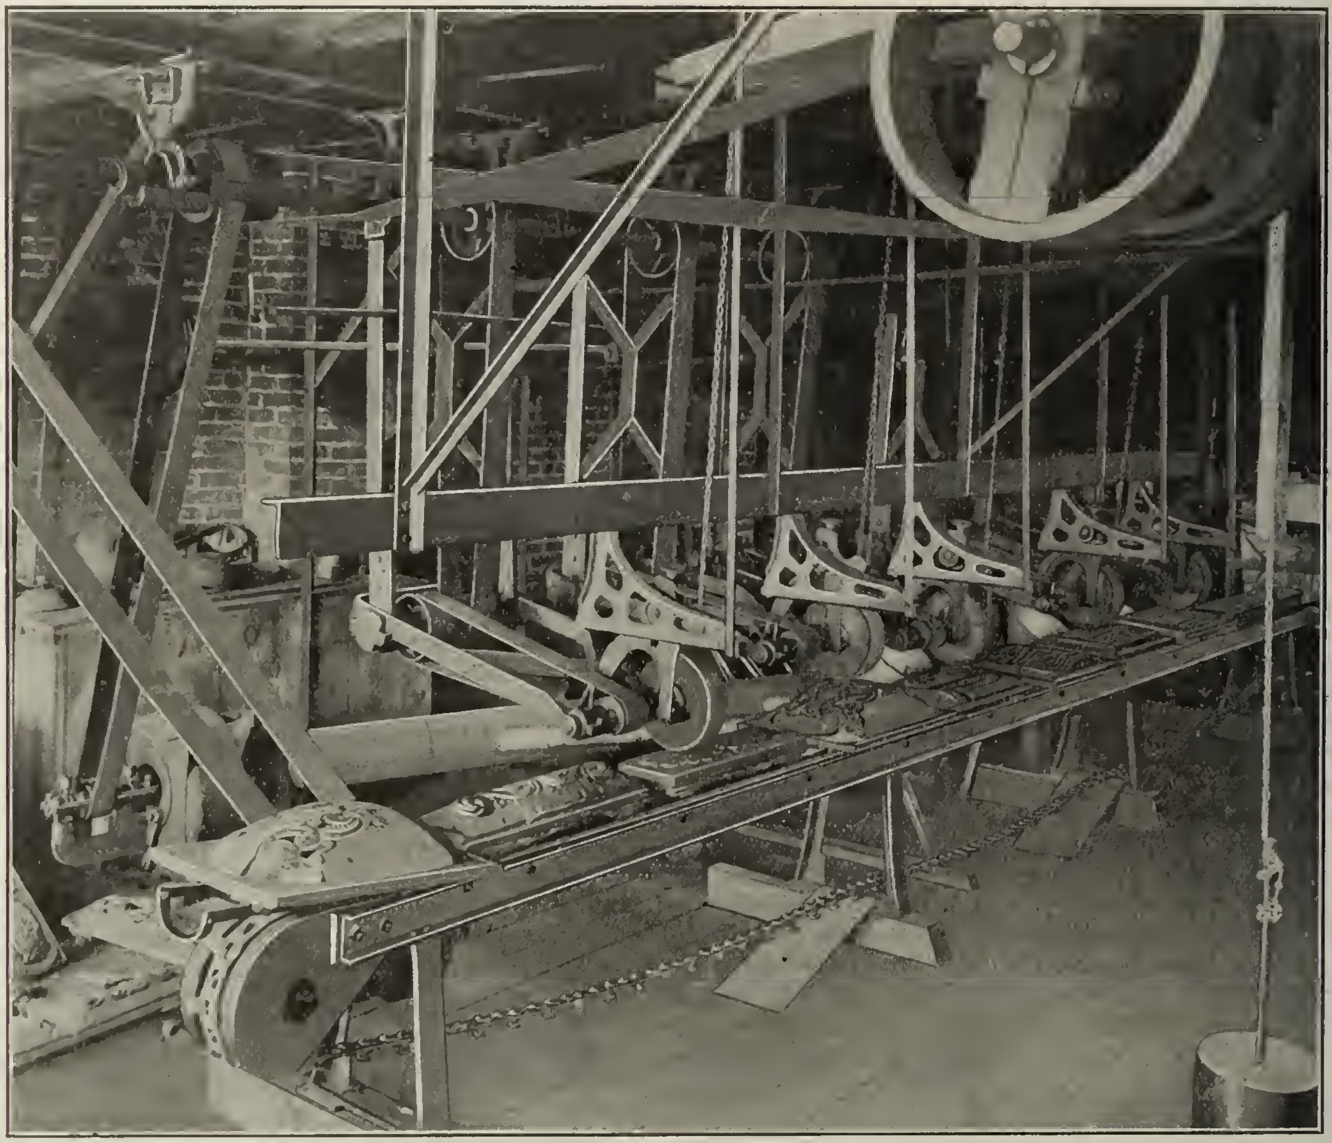
* * *

W. H. Colebrook Sons & Co., Syracuse, N. Y., announce a special offer in the shape of a miniature Swiss clock, handsomely carved and finished in walnut color, which they will give with every gross of their No. 15 Black Flag Stove Polish at $9 per gross. The clock is 5 x 7½ inches in size, and will run 20 hours with one winding.

The Robinson Automatic Polishing Machine.

The Art Stove Company of Detroit, Mich., have introduced an automatic polishing machine designed by W. V. Robinson, the superintendent of the works. The machine, as shown in the engraving, consists of a track about 22 feet long, placed about 3 feet above the floor. Along the center of the track runs an endless chain which travels the length of the table in about 7 minutes. Along this track, and gripping the chain as a cable car grips its cable, are work holders so designed as to hold the casting to be polished.

As the casting is moved along the track it is operated upon by five wheels, representing the successive processes used in polishing by hand. At the present time there are three roughing and two finishing wheels employed. At the end of the track the work holder runs up an incline, is released from the chain, and carried back to the starting point for a second trip.



The Robinson Automatic Polishing Machine.

The wheels which do the work are carried by arms connected with an eccentric which gives them a forward and backward motion at right angles with the track. The wheels are driven by belts from an overhead shaft receiving power from an electric motor. This arrangement is clearly brought out in the engraving. The movement imparted by the eccentric can be regulated to suit the size of the casting operated upon.

Above each of the arms is a counterbalance by means of which the pressure of the wheel can be regulated.

As stated above, there are now five wheels, but the machine will be extended so as to carry two more in the form of oilers or finishers. This part of the work is now being done in the old way, but with the additional wheels all the work will be done by the machine, except perhaps the finishing off of the edges on peculiarly shaped castings.

St. Clair Ranges and Cook Stoves.

Some folders issued by the Belleville Stove Works, Belleville, Ill., illustrate and describe the St. Clair steel range and the Splendid St. Clair steel cook stove, both of which are offered in the usual modifications. The range is made of malleable iron and steel, with extra heavy fire box fitted with duplex combination coal and wood grate. The oven is of cold rolled soft steel, and the oven bottom is so braced as to prevent buckling or warping. The oven plates are riveted to malleable iron frames, both in front and rear of oven, thus making an air tight construction, which is referred to as being always clean and free from dust. The oven doors are malleable, strongly hinged, and line flush with the bottom of oven when open, and supported by malleable braces. The flues are lined with heavy asbestos board. The top oven plate is lined with asbestos, over which is an iron grating that hugs the plate at all points and prevents the asbestos from blistering and burning off. The St. Clair steel cook is also a new construction of good proportions and attractive ornamentation. The body is made of planished steel, and the interior oven parts of cold rolled steel. It is fitted with balanced oven door, large ash pan, cut centers, duplex grate and heavy linings.

◆

ACCORDING to the decision made by the directors of the Pittsburgh Stove & Range Company at their recent meeting the company's plants at Monongahela City and Sharpsburg, Pa., will shortly be sold in pursuance of the policy to concentrate their manufacturing at one point, which will be at the large new plant at Beaver Falls, Pa., which is now under construction. It is likely that the Allegheny plants and those located at other points will also be abandoned in the near future. The company now employ about 800 men in their various works.

CORRECT BASIS OF ESTIMATE FOR FURNACE WORK.

BY R. S. T.

In my short experience in fitting houses for hot air heating and in going over houses which had been fitted by other concerns which have failed, I have become very strongly impressed with the idea that the common plan of making an estimate based on the cubical capacity of the house to be heated is thoroughly unscientific and totally unreliable. It is unscientific, because the demand for heat depends upon the exposed area. A house of a given exposed area will require to maintain at a given temperature the same amount of heat no matter what its cubical capacity. A square house will have the largest amount of cubical capacity in proportion to exposed area, but a house which has the same area, but on account of its rambling character, has only half the capacity, would require just as much heat as the square house of the larger capacity.

The larger capacity will, of course, require a longer time in which to bring the temperature up to the required point, if the house is cold, as a larger volume of air will have to be poured into the house. But, the house once heated, the heat escapes only through the exposed area. We have, therefore, adopted in our business the rule of calculating the exposed area instead of the cubical capacity. In the case of ordinary dwelling houses we pay no attention to the glass surface for they average about the same. In the case of stores with glass fronts, or churches with large decorative windows, we make the usual allowance for the additional glass surface. If there is a skylight, we make additional allowance for the skylight above what we would for the same amount of glass surface in a side wall.

Our standing rule for ordinary houses is 1 square inch of air admission to the furnace for every 10 square feet of exposed area in the house. In the estimate we estimate all the outside walls and the flat surface of the roof. Where a house has an attic over it which is not heated, but wihch is shut off completely from the house by doors at the top or foot of the attic stairs, we can do with less heat than where there is no attic. But if there is an attic with an open stairway well, we have to count in the exposed area and all the additional area of the attic. So far in our experience this rule has worked well when combined with a little common sense.

We have not found that any rule will remove the necessity for the exercise of common sense. If we find that a house is poorly constructed, with very thin walls and the thinnest possible coat of plastering which you can almost see through, we know that the usual rules will not hold good, and there must be an extra allowance of heat to make up for the lack of protection in the walls. In stores with large double front doors and an active trade, common sense teaches us that every time the front door is opened a large amount of hot air will escape and an equal amount of cold air be admitted. In such cases we have to give an extra supply of hot air to make up for the waste from this source.

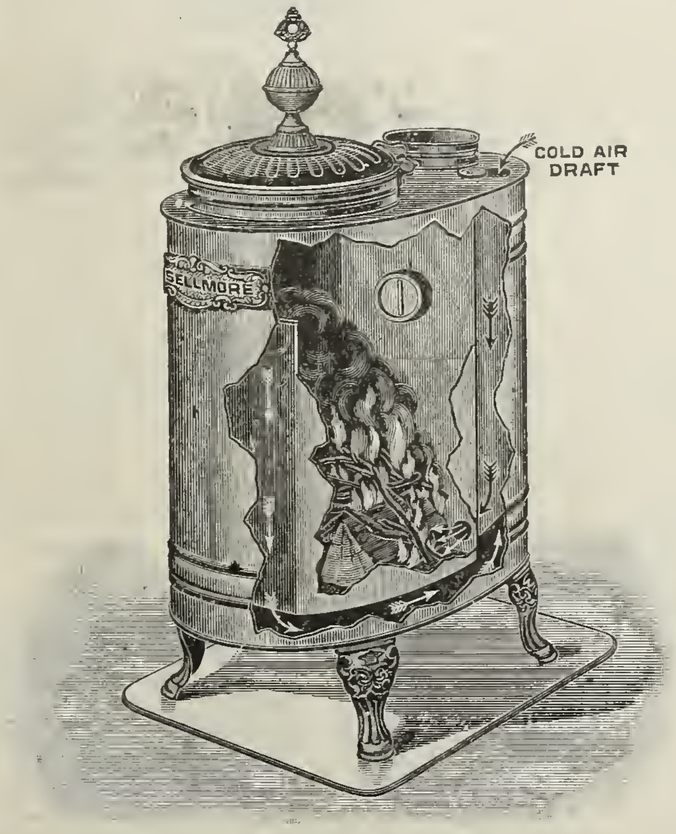
I hope that these suggestions may be of some assistance in securing more scientific treatment of the matter of heating by hot air.

The Logan Stove Pipe Thimble.

The Logan Mfg. Company, Ottumwa, Iowa, are offering a stove pipe thimble which is double a part of its length. The outer shell tapers, while the inner or shorter shell is of the same diameter throughout. The two shells are fastened together at the smallest end of the thimble, thus leaving an opening between the shells for the stove pipe to enter. Among the advantages claimed by the manufacturers are the following: That the pipe needs no wiring, that the pipe cannot be pushed too far in the flue, that it prevents smoking the wall or wall paper, that soot cannot blow into the room, that the pipe will not come out of the flue, that creosote or water cannot run down the wall, that there is no trouble from the draft passing into the chimney around the outside of the smoke pipe, and that a perfect draft through the stove is thus assured.

The Sellmore Air Tight Wood Heater.

What is said to be a radical departure in the construction of air tight wood heaters is incorporated in the Sellmore, now being manufactured by Hemp & Co. of St. Louis, Mo. A broken view of this wood heater is presented herewith, the course of the air currents and products of combustion being clearly indicated. The stove is said to possess all the principles and good features of a down draft, hot blast, base heating air tight, and is so constructed that every square inch forms a radiating surface. The draft regulators are ornamental sliding plates connected with air shafts through which the cold air is forced into the stove. An open damper gives an ordinary air tight stove with direct draft up the chimney, while with a closed damper the course of the products of combustion is toward the front of the stove over the partition, as shown in the illustration, then down along the bottom of the stove, from whence they ascend to the smoke pipe, and escape to the chimney. Norvell-Shapleigh Hardware Company, St. Louis, are the selling agents for this heater.



The Sellmore Air Tight Wood Heater.

The Richmond Company Incorporated.

The Richmond Company is the name of the corporation just chartered at Norwich, Conn., with an authorized capital of $500,000, who have purchased the entire business, including patterns, machinery, tools, trademarks, good will, &c., of the Richmond Stove Company of that place, and will continue the manufacture of stoves, ranges, steam and hot water boilers, &c., under the name of Richmond, as heretofore. We understand that the expanding business of the old company required more capital than could be provided under their old charter, and it was therefore deemed expedient and necessary to organize a new company with a larger authorized capital to take over and carry on the business.

The officers of the Richmond Company are: President, W. S. McMullen; vice-president, William N. Blackstone; secretary and treasurer, F. S. Haywood. The directors of the company are: William N. Blackstone, A. K. Chase, William B. Young, Charles Bard, Frances J. Leavens, Frank A. Mitchell and W. S. McMullen.

From the above it will be seen that the same directors and officers of the old Richmond Stove Company will have in charge the management of the affairs of the new concern. The statement is made that during the past four years the business of the old company was more than doubled, and the volume is increasing to such an extent that a large addition to the works has been found necessary.

The company have just completed an addition to their foundry, 103 x 70 feet in size, and have in process of construction a new foundry building, 150 x 150 feet; also a warehouse of the same dimensions.

ODD PLATES.

The Eclipse Stove Company, Mansfield, Ohio, are favoring their friends in the trade with a poster calendar covering the remaining months of the year. The sheets, of which there is one for each month, are bound at the top with a metal strip and provided with a metal eye for hanging the calendar upon the wall or wherever may be most convenient. The upper half of each sheet is devoted to illustrations of some of the company's specialties in the way of Ranges and Heaters, these being accompanied by brief descriptive text. Prominent among the goods shown is a new line of Cook Stoves and Ranges offered under the name of Victory Eclipse, the Triumph Eclipse Steel Range, the Lustrous Eclipse, a new hard coal Base Burner and Double Heater, the Astral Eclipse, a new Steel Cook, and the Premier Eclipse, a six-hole Range with square oven. The lower section of each sheet is devoted to the calendar proper, which, in addition to giving the days of the week and month, also indicates the various phases of the moon.

William C. Williams, North Lawrence, N. Y., is the inventor and patentee of an adjustable Stove Pipe Fastener and Asbestos Flue Stop, which he claims to be a remarkably efficient and at the same time economical device. Mr. Williams is seeking a manufacturer to produce this device for him.

A dispatch from Norfolk, Va., states that the Board of Trade of that city are corresponding with a Stove company of Albany, N. Y., who propose to establish a foundry in Norfolk. The company, it is stated, contemplate the investment of $300,000 in the enterprise, $200,000 of which amount is to be subscribed by local capitalists. Ten acres of land with water and rail facilities are required.

The death of Walton C. Waterbury, which occurred at his home at La Grange, Ill., on May 29, removes from the Chicago iron trade one of its most esteemed members. He was 44 years old, and was born in Lapeer, Mich. He was connected with Rogers, Brown & Merwin of Chicago as pig iron salesman. In 1892 he took a position as salesman with Forster, Backman & Hayes, the firm subsequently becoming Forster, Waterbury & Co. in 1900 ill health caused Mr. Waterbury to retire from active participation in business. He was well known to the Stove manufacturers throughout the West and was highly esteemed by them.

Charles C. Heath & Co. are sending out from their Philadelphia branch two mottoes intended for the careful consideration of dealers generally. One of these is "The store man or woman that succeeds nowadays always grows from the rough handling of criticism of competitors, not from the fatal germ of praise of same." The second motto is to the effect that "Money is made on turn overs and lost on left overs."

The disastrous flood which occurred at Joliet, Ill., in the first part of the month resulted in the loss of several lives and extensive damage to property. Among the sufferers were the Joliet Stove Works, the damage to whose plant aggregated some thousands of dollars.

The Peck-Williamson Heating & Ventilating Company of Cincinnati, Ohio, have begun work on a factory building at Wellston, Ohio. A bonus of $8000 and a 5-acre site are offered at Wellston. The goods of the company will be made and mounted there, but their general offices continue in Cincinnati.

The Chattanooga Stove Works, Chattanooga, Tenn., are about to erect a two-story brick structure on Catherine street, between Sydney and Whiteside, which will be used for storage and warehouse purposes.

The Mountain City Stove & Mfg. Company, Chattanooga, Tenn., have found it necessary to increase their facilities, and they are about to erect a two-story structure, which will be used for warehouse purposes.

The March-Brownback Stove Company, Pottstown, Pa., in order to meet the growing demands of their business have decided to enlarge their foundry and molding room. It is stated that one of the buildings belonging to the Linfield plant will be taken in sections to Pottstown and added to the present molding room. The annex will be 50 x 80 feet in area.

The Excelsior Steel Furnace Company, 38 and 40 West Monroe street, Chicago, Ill., have recently placed on the market some new goods in the shape of Elbows and Stove Pipe, offered under the name Excelsior. The Stove Pipe is made of galvanized iron, and can be nested so as to occupy comparatively little space in the shop. The company state that this is the only Galvanized Iron Nested Pipe on the market, and that its merits are such that "there will be no inducement for the manufacture of hand made Pipe." The catalogue which the company have issued shows their various specialties, including Excelsior Steel Furnaces.

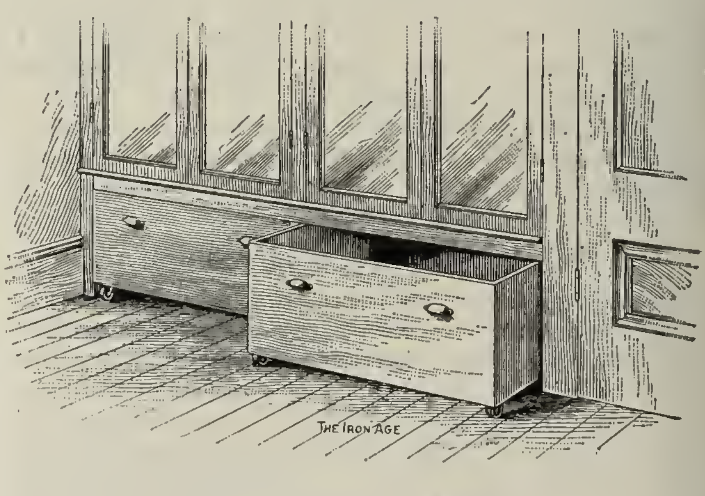
H. Adler Company, 241 First avenue, Pittsburgh, Pa., are keeping the merits of their Acme Gas Ranges constantly before the trade by means of blotters which they are extensively distributing. The face of the blotter carries the descriptive text under the title "Pressure," of which it is pointed out there is more than one kind. This, they state, was kept in mind in designing the Acme Gas Ranges, with the result that the Range is said to operate equally well under the highest or lowest pressure. With regard to pressure as applied to business, they state that they are well occupied in most departments, but Acme Gas Ranges being new, they are in a position to absorb a few more orders for them. They make distinct types of Stoves for both gases, with separate flue for each burner to carry away disagreeable fumes, adjustable air mixers, asbestos lined oven, flush top and first-class workmanship. The top and bottom oven plates are made of cast iron. The company suggest that dealers interested in goods of this character send for their catalogue No. 35, which shows an extensive assortment.

Ayling Brothers, Chicago, manufacturers of Stove Polish, announce that samples of their new manufacture will be sent free to Stove dealers and manufacturers upon application. The Polish is a prepared powder and has been patented both in the United States and Canada.

The Michigan Stove Company, Detroit, Mich., have issued a small sized desk calendar very attractive in appearance and containing the last six months of this year and the first six of next. The trade-mark of the Garland Stoves and Ranges occupies a conspicuous place on the card.

Drawers Under Show Windows

A rather unusual feature in store arrangement is seen in the store of Jordan Bros., Willimantic, Conn., in which the space under the show window platforms is utilized to good advantage. This is done by means of drawers about 5 feet long, which is the depth of the window, mounted on rollers, so that they can be easily pulled out and pushed back into place again. The arrangement is clearly shown in the accompanying illustration.



Drawers Under Show Windows.

NEBRASKA RETAIL HARDWARE DEALERS' ASSOCIATION.

Another very promising State association has been formed in Nebraska, the organization meeting taking place in Hastings on the 3d inst.

A few weeks ago the hardware merchants of Hastings and Holstein decided there was need of a retail association. Alexander F. Meyer of Hastings was chosen secretary of the movement, and the other dealers agreed to share the expense of ascertaining the sentiment in the trade. Mr. Meyer visited several towns and wrote many letters. So much encouragement was extended that a meeting was called at Hastings on June 3. In the meantime correspondence took place with the National Retail Hardware Dealers' Association, and they were invited to send a representative. They responded to the call and were represented at the meeting by their secretary, M. L. Corey, who was present throughout and who materially assisted in making the meeting interesting and successful.

Mr. Meyer called the assembled merchants to order, and after stating the object of the meeting, C. K. Lawson of Hastings was chosen temporary chairman, and Mr. Meyer temporary secretary. The question of forming a State association was then submitted to the gathering, and every dealer present expressed himself as favorable to the project. The following committees were appointed, to report at the afternoon session:

CONSTITUTION AND BY-LAWS: C. D. Morton, Omaha; G. E. Isamon, Hastings; Kimel Barnes, David City; J. C. Cornell, Ord; J. B. Hunter, Aurora.

RESOLUTIONS: H. Heuke, Grand Island; Thos. Nelson, Diller; Fred. Binderup, Hastings; Theodore Lindholm, Omaha.

NOMINATIONS: J. A. Peterson, Oakland; A. E. Small, Minden; W. E. Jakeway, Kearney.

TEMPORARY EXECUTIVE COMMITTEE: Alexander F. Meyer, Hastings; Theodore Lindholm, Omaha; W. E. Jakeway, Kearney.

In the afternoon session constitution and by-laws were unanimously adopted, as well as the following resolutions:

Resolved, That every member present shall use every effort to enroll every legitimate Hardware dealer in the State so as to make our association a success.

Resolved, That the thanks of this association are hereby tendered to the Hardware dealers of Hastings and Holstein for the able manner in which they worked to make this meeting a success; especially to Alex. F. Meyer, to whom much of the credit for this organization is due.

Resolved, That the Nebraska Hardware dealers are opposed to the Parcels Post bill, and will use every honorable means to defeat this meature.

Resolved, That we recognize and appreciate the interest shown by the National Hardware Dealers' Association in sending their secretary to assist us in organizing—that Mr. Corey has contributed very much to the success and interest of this meeting and we hereby extend our thanks by a rising vote.

The following officers were elected:

T. W. MORTON, Omaha, president.
C. K. LAWSON, Hastings, first vice-president.
W. T. COLEMAN, McCook, second vice-president.
J. C. CORNELL, Ord, third vice-president.
HARRY HALL, Lincoln, secretary and treasurer.

The next meeting will be held at Lincoln. The advisability of holding a midsummer session in August is being considered by the Executive Committee, many of the members of the association strongly favoring the idea.

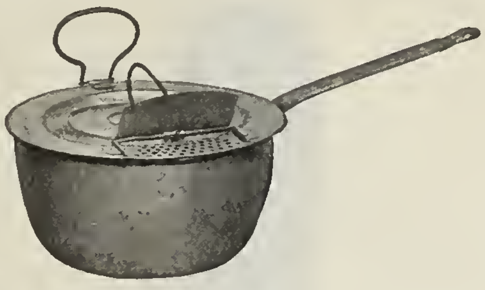
◆

TUCKER & DORSEY MFG. COMPANY, Indianapolis, Ind., manufacturers of Hardware and Wooden Ware Specialties, for whom John H. Graham & Co., 113 Chambers street, New York, are selling agents, issue an illustrated catalogue of their products. An important and diversified line is a series of Alarm Tills, or Money Drawers, of which several have new features. Other goods are Wood Saw Frames and Bucks, Stove, Barrel and Box Trucks, Vegetable, Slaw and Kraut Cutters, Towel Rollers, Hat and Clothes Racks, Towel Racks, Knife and Fork Trays, Lemon Squeezers, Mop Wringers, Step Ladder and Chair and patent Casters, all of which are in large assortments.

H. M. KELLOGG has disposed of his Hardware, Stove, plumbing and heating business at Cortland, N. Y., to Cramer & Spencer, who will continue at the old stand.

Aluminum Cooking Utensils.

The Aluminum Cooking Utensil Company of Pittsburgh, Pa., are now manufacturing and placing on the market about 100 different kinds of aluminum cooking utensils, a few examples of which are shown in the accompanying illustrations. In Fig. 1 is shown the Handy saucepan, which may be used for canning, preserving or pickling, also for making jellies, sauces, soups and broth, and for cooking vegetables. The Handy strainer cover is a special feature of this utensil. By a very simple device, shown in the engraving, the cover is locked to the kettle, and a strainer is provided, through which broths and liquids may be strained without scalding the hands or emptying the contents of the vessel.



Aluminum Cooking Utensils.—Fig. 1.—Handy Saucepan.

In Fig. 2 is shown one of the company's preserving kettles stamped from one piece. It is pointed out that the most delicate jellies, butters, preserves, sauces and all kinds of fruit can be thoroughly cooked in this utensil without the necessity of stirring and no danger of burning.

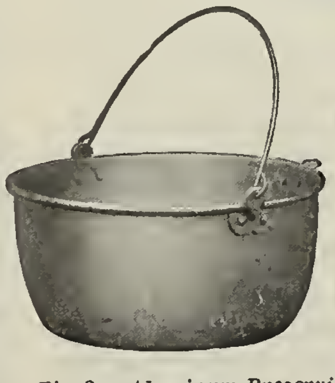


Fig. 2.—Aluminum Preserving Kettle.

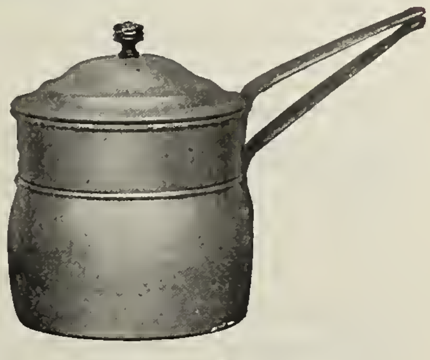

Fig. 3.—Aluminum Double Boiler.

An aluminum double boiler is shown in Fig. 3. It is composed of two pots, both made of the white metal. These pots may be used together in the usual manner, or either may be used alone. The cover is also of aluminum and made to fit snugly to the vessel.

Aluminum griddles are said to be especially effective for baking cakes without grease, and also as meat broilers. In Fig. 4 is shown one of the company's oblong griddles, made of cast aluminum and highly polished. These oblong griddles are made in two sizes, 9¼ x 19 inches and 12 x 24 inches respectively. The company also manufacture three sizes of round griddles, 12, 14 and 16 inches in diameter.

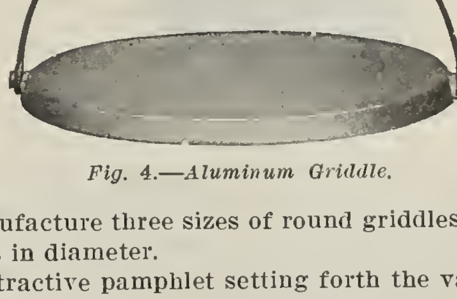

Fig. 4.—Aluminum Griddle.

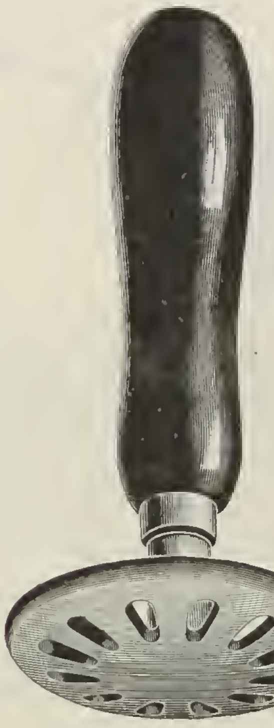
An attractive pamphlet setting forth the value of aluminum ware for cooking purposes is issued by the Aluminum Cooking Utensil Company, which contains a considerable amount of interesting information bearing on the metal, its properties and recommendations, and comparing it with other metals. Hints are also given for the care and treatment of aluminum cooking utensils.

The Universal Vegetable and Fruit Masher.

L. D. Parkhurst, Danielson, Conn., is placing on the market the masher herewith shown. The base is made of malleable iron, heavily tinned to prevent rusting. The wooden handle is provided with a heavy coat of black enamel, so that it will not be affected by hot water or steam when in use. The mashers are well and substantially made, and are packed half dozen in a box, one gross in a case.



The Universal Vegetable and Fruit Masher.

The Ohio Steam Cooker.

The accompanying cut represents a steam cooker put on the market by the Ohio Steam Cooker Company, Toledo, Ohio. The cooker is provided with a copper tank, a condenser and a tube to carry the waste steam back into the water tank at the base; also a gauge indicating when the cooker needs more water. Features of the cooker are its square shape, doors and removable shelves. The doors obviate the necessity of letting down everything to be cooked from the top, as is the case with a round cooker, and of lifting out different dishes to get at the desired article. It is explained that meat, pudding and vegetables may be cooked at the same time without emitting any unpleasant odors or mingling the flavors. The cooker is also recommended for canning fruit and other articles that are usually boiled in water or cooked in an oven. Among other points of excellence the manufacturers enumerate the following: That steam cooked food is more palatable and easier digested than food that is roasted, boiled or baked; that by the use of the cooker provisions, fuel and labor are saved; that when meals are delayed the food may be kept warm and not be spoiled by leaving it in the cooker, and that an entire meal can be prepared over a small gas or oil burner. The cookers are made in different sizes, with one and two doors and three or four shelves. A cook book accompanies each cooker, containing receipts that can be used in preparing different foods in the cooker.

Stove and Hardware Dealers.

The establishment of W. H. Goodfellow & Son, jobbers and retailers of Hardware, Stoves, Tinware, Agricultural Implements, Harness, &c., Hollidaysburg, Pa., was badly damaged by fire a short time since, their loss being $9000, with insurance of $6000. The firm have resumed business, and request copies of the latest catalogues and price-lists.

Bernard Haggerty and **F. J. Gagner** have opened a new store in Adams, Mass., under the style of Haggerty & Gagner. Their stock comprises Shelf Hardware, Agricultural Implements, Sporting Goods, Tinware, &c.

The old firm of French & Hahnenkratt, dealers in Hardware, Phillipsburg, Kan., have gone out of business. H. L. Hahnenkratt has located at Washington, Kan., and entered into partnership with L. C. Ames, and will conduct the Hardware, Stove, Tinware and Sporting Goods business at that point under the style of Hahnenkratt & Ames.

Freilburger Hardware Company are successors to J. J. Freilburger in the wholesale and retail Hardware, Tinware, Furnace and Roofing business in Fort Wayne, Ind. The company have lately added the sale of Fishing Tackle and other Sporting Goods.

J. S. Ogden & Bros., wholesale and retail Hardware, Stoves, Tinware, Agricultural Implements, Sporting Goods, &c., Ashland, Ky., are now in possession of their handsome new store. The building is a three-story brick structure, 25 x 133 feet, with stone front. It is equipped with an hydraulic elevator. Since moving to the new premises the firm have added about $3000 worth of stock, and expect to add as much more during the coming season.

Christensen & Shaw, dealers in Hardware, Stoves, &c., Ballard, Wash., have disposed of their business to Scram & Gordon, who will continue at the old stand. William Christensen of the former firm has purchased the stock and good will of T. B. Lambson, Ellensburg, Wash., and will continue that business under the style of Ellensburg Hardware Company. The stock consists of Hardware, Stoves and Tinware, and will be materially increased by the new proprietor.

A. C. Candor & Co. are successors to the late Joseph Candor in the wholesale and retail Hardware, Stove, Agricultural Implement and Sporting Goods business in Lock Haven, Pa.

E. D. Patton and **E. V. Abbott**, under the style of Patton & Abbott, have opened a new Hardware store at 220 North Sixteenth street, Omaha, Neb., carrying a complete line of Builders' Hardware, Tinware and Stoves. The new firm will discount all bills.

Fee & Stewart Company, Melbourne, Fla., wholesale and retail Hardware and furniture, have just opened a branch store at Fort Pierce, Fla., and will appreciate duplicate sets of catalogues pertaining to Hardware, Tinware, Rope and Twine, Agricultural Implements, Wooden Ware, Electrical Supplies, House Furnishings, Stoves, Sporting Goods, Paints and Oils, Glass, &c.

Edwin M. Waller has recently bought the stock of the Atlantic City Hardware store, 2114 and 2116 Atlantic avenue, Atlantic City, N. J., and will be pleased to receive catalogues and quotations from manufacturers.

Thomas W. Brown, proprietor of the Standard Company, Boston, Mass., died at his home in Belmont, Mass., a short time since. Mr. Brown was about 70 years of age, and had been engaged in the manufacture of Egg Beaters for upward of 30 years. He was of a mechanical turn of mind and the inventor of many patented articles.

The National Association of Master Steam and Hot Water Fitters.

FOURTEENTH ANNUAL CONVENTION.

The delegates to the fourteenth annual convention of the National Association of Master Steam and Hot Water Fitters were met with a cordial greeting, not only by the citizens of Atlantic City, N. J., who are devoted to making things pleasant, but also by the weather and the host of the Rudolf. The convention was called to order at 10.50 a.m. on Wednesday, June 12, by the president, Stewart A. Jellett, who welcomed the delegates to the first meeting held at this notable health and pleasure resort and introduced to them the Mayor of Atlantic City, Franklin P. Stoy.

Mayor Stoy, who evidently is experienced in saying happy things and in extolling the attractions of Atlantic City to the visitor, interested and delighted the guests of the city and secured hearty applause when he spoke of the attention any would receive who might have occasion to visit for any purpose the departments under his immediate jurisdiction. In closing, the Mayor extended to the visitors the courtesies of an open city.

The president then appointed the following Credential Committee: A. E. Kenrick, chairman; J. Henry Howe, A. N. Chambers, W. W. Biggs and John C. F. Trachsel.

The president's address was then presented as follows and received hearty applause.

The President's Address.

Fellow members of the National Association of Master Steam and Hot Water Fitters: Custom has decreed that it shall be the duty of the president of any association such as ours to make an address at its conventions. I esteem it a privilege, as well as a duty, to address you at this, our fourteenth annual convention, and to bid you all a most hearty welcome.

The object of these annual gatherings of our members is not only the pleasant one of greeting old friends and making new ones, but also the more serious one for which this association was formed—to wit, the fostering of trade and commerce among master fitters and the advancement of the business of steam and hot water fitting.

It is not my purpose in this address to comment on the work done by our association during the past year, important though it has been; the reports of the National Executive Committee, the secretary, treasurer and the national vice-presidents for States will give you the details of what has been accomplished. Your careful attention is asked to these reports and the recommendations or suggestions made in them. It will be to the interest of the association that they be freely discussed, in order that the officers to be elected for the ensuing year may have the benefit of the views of the members as to what should or should not be done in order to carry out more fully the purposes for which we organized.

The past year has been a prosperous one in all lines of trade and master fitters have shared in it, hampered somewhat in certain sections by labor troubles, and in others by delays in the construction of buildings on account of the builders' inability to secure in time necessary building materials, notably steel structural work. Business continues good, and the look ahead is fairly satisfactory. It would seem wise, however, for the members of this association to give careful consideration to the future of our business in view of the changes that are taking place in the methods of doing business. This is an age of concentration. Corporations already large are growing larger, by either absorbing or forming alliances with their rivals.

This movement is not confined to railroad companies, shipping interests and the like, but is extending into every branch of trade. The "community of interest" idea seems to many the true solution of business problems created by long years of bitter competition.

Members should consider thoughtfully the proper method of advancing our business under these changed conditions. The broad motto of the business world is, "The maximum of business at the minimum of expense," and the policy of concentration is expected to further this object. It has been proven by experience that the old adage, "Competition is the life of trade," is capable of misinterpretation. Competition can overreach itself and become the death of trade, and unregulated competition is to-day the bane of many branches of business, including our own. Business men are at last learning the truth of this statement, and this accounts in a great measure for the growth of trade associations, particularly in such trades in which it is impossible or undesirable to consolidate. Again, in view of the enormous aggregation of power in the hands of the larger manufacturing corporations, the individual users of their goods, who are widely scattered geographically, are finding it to their advantage to have understandings through their trade organizations so that they may be able to secure fair treatment from such manufacturers as are inclined to be unfair, something they could not do as individuals.

The workmen in the various trades are meeting the same problem by the formation of labor unions and by federations of separate unions, hoping by concerted action on the part of the unions of the various trades to force consideration of what they claim to be their rights. It would seem that the workmen of our country are making more rapid progress in solving the problem of concentration than are their employers; as witness the rate of wages paid to-day with the hours of work, as compared with a time but ten years back. It is to the interest of master fitters to direct this movement rather than be forced by it. Better understandings should be reached between our members and their employees, covered by agreements for fixed periods of time. It seems to me that the solution of the labor problem rests primarily in agreements between employers and employees in each trade without reference to their effect on some other trade. Neither should a misunderstanding in any one trade be a source of contention in other trades, but the difficulty should be adjusted by arbitration within the trade where the misunderstanding has arisen. The master fitters in Philadelphia have recently entered into an agreement on these lines with their employees, which agreement recognizes the difference in the ability of men by fixing a minimum and maximum scale of wages. It also defines that all questions that may arise shall be settled by arbitration, and that strikes shall not take place because of trouble in other trades. This agreement also covers a number of other important matters on lines somewhat different from those usually found in such contracts.

Several other trades in Philadelphia have adopted the same general form of agreement, and we look forward to a more peaceful time as the result of their action. What the outcome of these changes that are taking place in business methods and of the new relations with our employees will be none can fully predict; but I am optimistic enough to believe that the concentration of brains being brought to bear on the question will result in a general bettering of conditions for both employer and employee, and redound to the general good of the country. Of course, friction is always present during the development of such a general movement as this, but by the exercise of patience, continued discussion, keeping clearly in mind the objects aimed at, it seems to me that the results can be only beneficial.

Let us consider seriously and practically at this convention our relations with the manufacturers and jobbers of steam fitting materials. This, to my mind, is the most important of the pressing questions that demand immediate consideration. The satisfactory solution of it rests largely with ourselves.

Manufacturers generally agree that it is to their best interests to sell their product through the legitimate steam fitter, assuming, of course, that the steam fitter is in a position to pay promptly for his purchases and also that he has the ability to erect the apparatus in such a manner as to do credit to its manufacturers. Their views on this matter agree with that of master fitters generally.

Every manufacturer that I have talked with on this subject agrees with this position, but many of them directly, and some indirectly, do not live up to it, but sell to the consumer on the plea that their competitors will do so if they do not, and that they will lose the business. This argument, "the other fellow is doing it," is worn threadbare. It never was anything but shoddy and has long been out at the elbows. If manufacturers and jobbers knew what master fitters think of it they would discard it entirely, or at least invent a new excuse.

There are good business reasons why the manufacturers and jobbers of steam fitters' materials should stop selling goods to consumers, and they know what these reasons are. The consumers as a class have no knowledge of how the apparatus should be erected in order to do its best work, and when they undertake to erect it themselves it is generally improperly done and the result is unsatisfactory. The manufacturer selling the goods is called in and must send an engineer or instructor to remodel the work. This means additional expense to him and at the same time he places himself in a position of antagonism with the legitimate steam fitter, who knows his business and probably has bid on the work, with the result that for the single boiler or other apparatus he has sold to the consumer he may lose the sale of a quantity of goods which the fitter, whom he has displaced, would have used in other work. If the manufacturer or jobber constructs the work for the consumer he naturally cannot expect the support of the master steam fitter, who by this action of his loses business that he has a right to expect. Result, a new opponent for the manufacturer who does business in this way.

Many manufacturers and jobbers may think that because comparatively few complaints are made to the National Executive Committee our members are indifferent. I do not think this idea is a correct one. Many of our members know of violations, but hesitate to report them and put themselves in the position of acting as complainant. In a number of other cases they have strong suspicions of the situation, but to secure the facts means considerable labor of an unpleasant nature on their part, and rather than go to this labor they satisfy themselves by refusing to handle the goods made by the concern in question and use their best efforts to keep them from getting business.

The motto of our association, "Who helps me I help," underlies the whole matter, and in order to reap the full benefit of organization the full meaning of this motto should be kept firmly in mind by both the manufacturers and jobbers and the master steam fitters. If a manufacturer supports honestly and carefully the trade resolutions, our members in turn should do everything in their power to support such manufacturer, as against the manufacturer who does not. If you concentrate your buying through manufacturers and jobbers who live up honestly to our trade resolutions, and cut off all purchases from those who do not, the list of those who will protect the trade will soon increase.

It is not fair to expect that manufacturers will live up strictly to the trade resolutions unless we in turn buy our goods from those who do. It is not fair for our members to expect the division to be "90 per cent. help me and 10 per cent. I help you," or expect others to help you continuously with the promise to help them at some future time not yet determined. The old adage, "Live and let live," fits the case. This matter has been brought clearly to my attention during the time I have been a member of the National Executive Committee. Many of our members seem to have the impression that the trade resolutions were created solely for their own benefit, whereas it is clearly the understanding that the manufacturer and jobber shall benefit jointly with our own members. If all our members keep this fact in mind and act accordingly, the results will surprise you. The working together of the members of our association with the signers of our trade resolutions will result in great trade benefits.

The power of this organization to remedy existing evils in our trade is not fully understood by many of our members, and certainly is not by the fitters who are outside of our organization; if they did fully understand it our membership would rapidly increase. To accomplish well the work that is to be done requires every member to do his duty. Do not expect your officers to carry the whole load. They, like yourselves, are busy men and cannot give all their time for your benefit.

Remember, this organization was not formed merely to defend ourselves against attack, but rather for the correction of evils in the trade and for the general betterment of trade conditions. The success of an organization such as ours is largely a matter of education upon trade questions, which education cannot be acquired in a day or year. There are few men in business who can fairly consider a business situation from the point of view of their competitors as well as that of their own, but they must do this before realizing that trade conditions as a whole must be bettered before any permanent improvement can be made in their own business. Our trade has been rather slow to understand the full benefits to be derived from proper organization. When it is understood I look to see the larger part of all the steam heating work in this country done by members of this association, not alone because it will be to the advantage of all reputable steam fitters to belong to such an association, but because it will be to the interest of owners to place their work where it will be done properly, and it should not be possible to have it so done except through the members of this association.

I trust the day is near at hand when there will be a perfect understanding between the manufacturer, jobber and master fitter—the three divisions of our business. The greatest danger we have to fear comes from the man who acts solely on the grounds of expediency. Any settlement that seems to prevent immediate pecuniary loss seems to him satisfactory, and he uses his energy to secure such settlement, not taking the broad ground that is necessary to any successful permanent agreement. This is like giving a demand note in cancellation of a debt and congratulating one's self that the matter is settled.

I trust this convention will look carefully into the matter of increasing the membership of this association. As our membership increases the buying power of the organization increases, and its influence increases correspondingly. It is, therefore, of the utmost importance that this matter be given earnest consideration. The object is not merely to secure members; we want the best men in the business. By this I do not mean to imply the men with the largest financial backing, but any fitter who does good work and pays his bills and is a fair minded man. If his reputation is not good, then, no matter what his financial ability or the length of time he has been in business, it would be better for this organization that he remain outside. The questions of the coming year's business, the growth of this association and the lines on which it should work should be given your most careful attention, and I trust that the committees that are to be appointed to handle the several matters which are submitted to them will give their time and best thought to these questions. I would ask the members in attendance to suggest matters that will be of interest as to improvements in trade relations, as to method of work to be followed in developing this organization, &c., and will present these questions in the meeting or before the proper committees.

We cannot accomplish all that is to be desired in a year, but every step forward is that much gained and tends toward the strengthening of the organization, and, through the organization, of all of the individual members composing the same.

The underlying principle of all successful business is confidence. Let us begin by having confidence in one another and exert ourselves to see that this confidence is not misplaced.

Keep fair with your fellow members—let no temporary advantage lure you from this. Make use of and support your organization and you will find in return that it will repay you.

After a recess, to allow the Credential Committee time for their work, the following members were reported entitled to the convention floor:

NOMINATING COMMITTEE.

E. D. Smith, John Gormly, J. J. Collins, P. H. Kendricken, Charles A. Criqui.

Henry L. Hall, chairman of the Executive Committee, having been recalled home, the annual report of the Executive Committee was read by the president.

Report of the Executive Committee.

June 11, 1901, the National Executive Committee held their first meeting at the International Hotel, Niagara Falls, and organized by electing Henry L. Hall as chairman, and Henry B. Gombers as secretary, to succeed himself, he having served in that capacity since April, 1897. Francis A. Williams, Stewart A. Jellett, Albert N. Chambers and Henry L. Hall were appointed a subcommittee to transact such detail business as was not necessary to present to the National Committee.

SURETY BONDS.

Under a provision of the constitution of the National Association the national treasurer and the national secretary are required to provide surety bonds, and in accordance therewith these officers delivered to the chairman of your committee bonds of an approved surety company for the required amounts.

ADMINISTRATION.

Your subcommitee have been enabled by their authority to dispose of a vast amount of detail work that would have been delayed and possibly not accomplished at all had it been necessary to present the subjects to each member of our widely distributed National Committee. In many cases there were subjects of such weight that your subcommittee were unwilling to make a decision until each member of the National Committee had given the subjects due consideration. We are happy to state that all the acts and decisions of your subcommittee have been heartily seconded and approved by each of the committee who reside at a distance from our national headquarters.

Our headquarters have been open for business every day in the year except Sundays and holidays, and each member of your committee has been ready and willing to answer an instant call for any service demanded for the interests of our craft. We have endeavored at all times to observe with scrupulous care the provisions of the constitution and by-laws in operating the business of this association. Our object has been at all times to eliminate any personality and secure the greatest good for the greatest number, trusting that such action on our part would add greater dignity to the elevated position held by this association in the esteem of its members and others.

FINANCES.

Under the head of finances the treasurer's report will represent with accurate detail the gratifying condition of our treasury.

MEMBERSHIP.

During the past year 32 members have been added to our membership roll, while 19 have been dropped by reason of death, resignation or suspension on account of non-payment of dues. In each case of suspension for nonpayment of dues the offending members were given full and sufficient notice that such action would be taken, and ample opportunity was afforded to prevent summary action if the members were so disposed. There have been many applications for membership, but on investigation it has been found that some of the applicants were not eligible.

There is a strong feeling throughout the association that the strength of a body is measured by its quality rather than its quantity, and we may congratulate ourselves that the net gain of 13 members is of a quality that is to be greatly desired. Since the close of our fiscal year we have added to our membership, and a detailed report of it will appear at the next convention; but for the purpose of general information we can state at this time that new local associations have been organized at Baltimore, Md., Atlantic City, N. J., Lafayette, Ind., and at central points in Montana and North Dakota.

OFFICIAL BULLETIN.

Our national secretary, Mr. Gombers, has had entire charge of this work and has executed all of the details in connection therewith with admirable efficiency and to the full satisfaction of your committee. We have at all times acted in an advisory capacity with reference to the policy of the "Official Bulletin."

STANDARD FLANGES.

Through the medium of the "Bulletin" we have advised our members that at the meeting held by a number of representatives of the principal valve and fitting manufacturers in the United States there was formulated a standard for extra heavy work. Our members and others interested will please bear in mind that this schedule does not supersede this association's schedule of standard flanges; but, on the contrary, can be considered as supplying a long felt want in the matter of a standard for extra heavy work. The schedule of standard flanges adopted July 18, 1894, by our association provided certain requirements for work with pressure under 80 pounds, as well as for work with pressure for 80 pounds and over.

There has been a difference of opinion as to how high a working pressure this standard should apply to, and it has been the contention of some of the well informed people in the trade that it ought not to be used for work exceeding 150 pounds pressure, because work requiring 150 pounds pressure and over would necessarily call for special fittings, which would be known as extra heavy. We understand that the majority of valve and fitting manufacturers have in the past used the same dimensions of flanges, but not thickness, for pressures averaging 125 pounds and upward, and this will probably be continued as a practice.

It is the opinion of one of the committee of manufacturers who compiled the recent schedule for extra heavy fittings that our association's standard of thickness will be used for pressures to 150 pounds; and for work above 150 pounds pressure the standard that has been suggested by the manufacturers' committee will be used. Therefore, it is again called to your attention, and you are requested to note that the standard flange schedule of our association still remains in force for ordinary work up to 80 pounds pressure and 125 pounds pressure respectively, and that the new manufacturers' schedule now presented to the trade will apply to work calling for 125 to 250 pounds pressure per square inch. We would recommend that this matter be referred to the convention for discussion and adoption.

TRADE RESOLUTIONS AND LIST IN ACCORD.

During the past year your committee have maintained a vigorous campaign in the interests of our relations with the trade at large. We have had many applications from manufacturers and supply houses to place them on our list in accord, and in every instance we have adopted the practice of thoroughly investigating the propriety of the application, and wherever we felt satisfied that the applicants would act in good faith we have placed them on the list, with the gratifying result that 41 names have been added to the list in accord. We have removed from the list in accord 45 names by reason of the firms going out of business.

NEW YORK STATE ASSOCIATION.

At the semiannual meeting of the New York State Association, held in Syracuse, December 10, 1901, a resolution was unanimously adopted recommending to the National Executive Committee that the question of separately letting steam and hot water contracts be taken up with the National Association of Architects and all supervising and State architects. It is believed that missionary work in this direction would materially assist in the elimination of steam work from general contractors.

The Executive Committee of the National Plumbers' Association, in session at the hotel, was invited to visit the convention. The invitaton was accepted, and President E. D. Hornbrook of Kansas City and Vice-President Charles A. Polacheck of Milwaukee addressed the convention on behalf of the Plumbers' Association. P. H. Kendricken of Boston responded on behalf of the convention.

The annual reports of the treasurer and the secretary and of the State vice-presidents were read and received, and the matters therein requiring consideration referred to the appropriate committees, as were also a number of resolutions submitted from various sources.

Report of the Secretary.

My sixth annual report will be a rehearsal of part of the work assigned to me by the Executive Committee during the past fiscal year. In presenting the subjects taken up in this report I will ask the indulgence of the association to the extent of permitting me to express an opinion or make suggestions upon some of the subjects that interest all those who have been identified with carrying on the work of the organization.

The Executive Committee's report, in the hands of Henry L. Hall, chairman of the committee, shows the general condition and presents some suggestions that are worthy of your careful consideration. The work of the Executive Committee has been promptly attended to by the subcommittee at national headquarters, and there arose no question that required the personal attendance of the other members of the committee, but if there had been any occasion for the presence of all the members, I have no doubt but what they would have cheerfully responded to the call.

Some of our members may not be aware of the fact that certain large concerns interested in the manufacture of steam heating material now maintain a principal office in the city of New York. Heretofore whenever we have had occasion to communicate with some of them it has taken valuable time for the necessary correspondence to pass to and fro, but owing to the proximity of their present offices it has enabled us to confer and obtain the necessary information, thus eliminating all the unpleasantness of delay, and also tends to avoid misunderstandings that could easily arise through the misreading of letters, &c. Some of the large manufacturers, whose principal places of business are located in various cities, have occasion to be present in New York at stated times, and it gives our Executive Committee an opportunity to meet them at our headquarters or elsewhere personally. It also gives your secretary a chance to confer with any of them whenever it is of interest to the association that he should do so. It seems as though the tendency in the East and the Middle West is to concentrate the principal offices or headquarters of associations at New York, and this being so, it certainly will assist to a very great degree the better conduct of negotiations and of necessity a quicker decision on matters of mutual interest.

OFFICIAL BULLETIN.

The statement was made in my report last year that I did not recall a single instance where any just or serious complaint had been made concerning our management of the "Bulletin." I can repeat that statement at this time, and go a trifle further by saying that we do not infringe on the rights of the trade journals or in any way do what would be considered unprofessional between contemporaries. We always give credit to the trade papers from which we take an extract, or from whom we obtain a cut to illustrate an article published in the "Official Bulletin."

We are not always so fortunate, however, and without any desire to stir up our esteemed contemporaries, it is nevertheless timely to request them to in future give us credit for what extracts they are kind enough to clip from the "Official Bulletin" for publication in their own journals. We are always willing to accommodate our friends with anything within reason, even though it does at times put us to some expense and inconvenience. During the past year we have published articles on various "Trade Abuses," written by one of our members, who is capable of producing articles of merit, and it is to be hoped that he will continue to furnish us with copy for publication. Other members should emulate this one and favor us with articles of interest upon any subject that concerns the welfare of the organization especially and the trade at large generally.

COMPLAINTS.

Under this heading would properly come a statement setting forth the various kinds of complaints made to national headquarters and the disposition of the same. On file at headquarters will be found all the data referring to complaints made against concerns on List in Accord, where it is at the disposal of all who are entitled to the same.

STANDARD FLANGE SCHEDULES.

During the past year the requests for copies of the schedules published by this association have been quite numerous. Applications have been made by members, manufacturers on List in Accord and concerns not on List in Accord, while one of the most recent ones (about two weeks ago) came from a man who was about to commence the manufacture of valves, and desired to start in with our standard, owing to the fact that he had found that the many valve manufacturers had schedules of dimensions of their own quite divergent.

All requests for copies of the schedules received from our members and manufacturers on List in Accord have been complied with, but there have been some requests from concerns not on List in Accord that have been unfavorably considered. One case in mind as an example: A Western concern more than five years ago refused to comply with the request made by a local association that the manufacturer in question should enter into an agreement with other manufacturers and dealers to protect the steam fitting trade in a city where we had a local association. The concern in question wrote us for copies of the Standard Flange Schedule issued by us, and the letter sent in reply was as follows:

> Replying to your letter, will state that the Standard Flange Schedules prepared and issued by us are for the use of our members, as well as for manufacturers and dealers whose names appear upon our List in Accord. As your name does not appear on the List in Accord we regret that we cannot comply with your request to furnish you with copies of same.

Your secretary is inclined to think that we should not show any favor to concerns who deliberately refuse to acknowledge the justice of our reasonable request that they extend the same protection to the trade that other manufacturers and dealers are willing (and many times voluntarily) to concede.

NATIONAL IRON LEAGUE.

You will doubtless recall the various items that have appeared in the " Official Bulletin " concerning the petition which the National Iron League presented to the House of Representatives at Washington. Much good was expected to come of this petition if members of this and other associations connected with the building trades would sign this petition, and also write personal letters to United States Senators and Congressmen urging them to favorably consider the proposition presented.

The subject is one that ought to have the hearty support of members of this association if occasion arises whereby it becomes necessary to again take up the petition to Congress. Who is there that can present a sound argument in favor of a steam heating contractor being as well off working as a subcontractor to a general contractor on a contract with the United States Government, as he would be if he held a contract direct from Uncle Sam ?

There may be cases where a master steam fitter would be well taken care of by a general contractor on work for private owners, and no hardship entailed and no objection offered to the taking of a subcontract from an honest general contractor, who awards the work to the bidder at figures originally given in securing the general contract. The crying evil is that which works to the disadvantage of a subcontractor through having to take a contract on a 75 or 80 per cent. payment basis, while the general contractor receives 85 or 90 per cent. payments, and thus holds money in his pocket which should properly go to the master steam fitter who acts as the subcontractor.

While on the subject of general contractors, it may be well to state that the National Executive Committee has ruled that under no circumstances can such concerns become members of this association. This ruling has become known to many of our members, but perhaps not to all.

Several general contractors have in their employ men who are supposed to take charge of the power, heating and ventilating work. This of itself is not objectionable, but when these building constructors set up what they term a " heating department," it becomes a question for this association to consider, in view of the fact that they go before the public as employing journeymen steam fitters, and are in the market to purchase material. Some manufacturers thought that such concerns were eligible as customers for steam heating material because this association had many years ago ruled that manufacturers who had a gang of steam fitters (regularly employed as such) in their employ would be entitled to a place on the Exempt Consumers' List. This certainly is an erroneous view to take. These building constructors are not manufacturers such as contemplated in the old ruling; furthermore, there is no such ruling in force at this date.

The trade resolutions adopted at Buffalo in 1899 are very clear and concise, and there ought not to be any excuse for misinterpreting them.

GENERAL CONDITION OF THE ASSOCIATION.

The secretary's report made at the eleventh annual convention, held at Buffalo in 1899, contained the following paragraph:

> It is quite natural that your secretary should have formed some opinions of his own, based on the experience obtained during the past two or three years. Speaking without bias or prejudice, and without fear of the statement being successfully controverted, I will say that this organization is to-day in a much healthier condition than it has been at any time since my acquaintance with its affairs. With the hope that the end of the coming fiscal year will show even a better state of affairs, I respectfully submit my report.

The report made at the twelfth annual convention, held at Boston in 1900, contained a statement somewhat similar, in so far that it stated that the continuation of the condition of the previous year hoped for was a fact. Last year at the thirteenth annual convention, held at Niagara Falls, your secretary stated that many reasons could be advanced for believing that the association was on a much firmer basis than it had been at times in the past. There was one feature, however, that received special mention, and that was the friendly feeling that existed between members and the expressed desire to stand together on questions that involved the interests of the association, as well as to give their countenance and aid to movements looking toward the betterment of the conditions of the trade at large, even where it must of necessity benefit people in the business who are not members of the Master Steam and Hot Water Fitters' Association.

It is a fact that many men in the business of steam and hot water heating obtain protection and consideration to which they are not entitled. This condition to a great extent arises from the magnanimous and philanthropical stand taken by the association regarding our trade resolutions. We do not request the manufacturers of steam heating material to refuse to sell a master fitter because he is not a member of this association, but we do request the manufacturer to refrain from selling those not regularly established in the business of installing heating plants. We do claim, and in many cases manufacturers concede, that members of this association are entitled to better prices than those who are in the business but who are not members of the National Association of Master Steam and Hot Water Fitters.

Some new members may not see benefits of such a nature as to be readily recognized, but the adage, " All things come to him who waits," has been proved over and over again, and sooner or later the " doubting Thomases " will be able to see the advantage of holding membership in the National Association.

My hearty congratulations are offered to the members who stand loyal and true to all the precepts and principles upheld by this association, and I trust that the value of the association motto, " Who Helps Me I Help," will be fully recognized and continually made use of to the honor of the organization.

Treasurer Albert N. Chambers of New York presented his report, showing a balance in hand May 1, 1902, of $2910.90.

The balance of the session was executive to its close, when the meeting adjourned until Friday at 10 a.m., to allow the several committees an opportunity to consider the matters referred and bring in their reports for action by the convention.

FRIDAY MORNING.

(*By Telegraph.*)

The convention opened in executive session on Friday, and at the close of the executive session went into open session and elected the following officers:

President, Alfred E. Kenrick, Brookline, Mass.

Vice-President, Henry L. Hall, New York.

Treasurer, Albert N. Chamber, New York.

Board of Directors: John D. Hibbard, Chicago; Jno. J. Collins, St. Louis; Jno. H. Howe, Rochester; Stewart A. Jellett, Philadelphia; P. Gormley, Philadelphia.

Sergeant-at-Arms, Geo. H. Zellers, Washington.

The officers also are members of the Board of Directors. Henry B. Gombers was unanimously elected secretary by the board. The session then adjourned.

THE NEW YORK STEAM FITTERS.

On Wednesday afternoon the 3 o'clock train on the Pennsylvania road received the greater part of the members from New York and their friends. They were enabled to travel comfortably in a chair car secured through the efforts of the national secretary, who was already in Atlantic City to complete arrangements for the reception of arriving members. However, his private secretary, Miss Birge, who was ably supported by A. B. Jenkins, maintained the prestige of the National Headquarters for courteous hospitality.

The travelers, headed by National Vice-President A. C. Kenrick of Brookline, Mass., were S. J. Geohegan, E. D. Smith, J. L. Wells, Frank Dobson, Ambrose O. Neal, A. N. Chambers, Mrs. A. N. Chambers, Master Chambers, Enoch Rutzler, Miss Rutzler, A. L. Fowler, Mrs. A. L. Fowler, Master Fowler, James Curran, Mrs. James Curran, National Treasurer H. L. Hall, J. B. Bernhard, Mrs. J. B. Bernhard, A. B. Jenkins, C. F. Webber, Wallace M. Cosgrove, E. H. Roberts, Mrs. E. H. Roberts; Frank K. Chew of *The Metal Worker*, A. A. Ainsworth of the *Plumbers' Trade Journal*, and H. A. Smith of the *Engineering Review*.

The same train also carried R. D. Reed and C. A. Faulkner of the H. B. Smith Company, Westfield, Mass.; C. H. Gott, E. F. Glove and Frank T. Bassett of the American Radiator Company, New York and Boston, and H. E. Adams of Boston. There was considerable visiting in the car and the trip was decidedly enjoyable. On arriving at Atlantic City Secretary Gombers met the train and soon had all comfortably quartered at the Hotel Rudolf, where they were welcomed by Mr. and Mrs. J. Henry Howe of Rochester, N. Y.; Mrs. Henry B. Gombers and Miss Blackwood.

THE TRADE PRESS.

It was a busy time for the trade press, but Secretary Gombers has a kindly feeling for the representatives, to whom he has granted special favors in the provision of papers and reports which he has ready to present at the proper time. These substantial courtesies are fully appreciated by those to whom they were extended. The press was well represented: *The Metal Worker* by Frank K. Chew, the *Engineering Review* by H. A. Smith, S. D. Bruce and C. Williams, the *Plumbers' Trade Journal* by A. A. Ainsworth, James M. Heatherton and C. W. Field, and *Domestic Engineering* by H. T. Sheriff and E. Winslow. Mr. Ainsworth, as usual, did some good work with his camera.

"FITTINGS."

George Downe of the American Radiator Company, Chicago, was one of the first to reach the convention Mecca and constituted a whole reception committee in himself, recognizing and cordially greeting every arrival.

* * *

The Monash-Younker Company, Chicago, were ably represented by L. P. Monash, their New York representative at 45 Centre street. High grade air valves will doubtless be more generally used by the fitters than heretofore as a result of the information given at this convention.

* * *

Parlors J and K were occupied by the Standard Steam Specialty Company, 111 Fifth avenue, New York, where E. H. Roberts and George I. Roberts dispensed genuine and substantial hospitality and literature of every specialty a steam fitter could need, from a grate bar to a damper regulator.

* * *

F. H. Moore of Utica and D. E. McCabe of Chicago represented the International Heater Company, Utica, N. Y., and a line of boilers and heaters adapted to every demand that a steam fitter might have to meet.

* * *

Parlor G was occupied by Jenkins Bros., New York, and A. B. Jenkins, as usual, reflected his genial enjoyment of the steam fitters' convention to each of the never ending line of visitors. He was assisted in dispensing hospitality by C. F. Webber of New York and Harry G. Logan and W. G. Lecompte of Philadelphia. The members received as souvenirs celluloid rules and pocket knives that will be a pleasant reminder that everything coming from Jenkins Bros. is all right.

* * *

John B. Hughes lost another lap in his contest with A. E. Kenrick for regular attendance at every convention. Mr. Kenrick now enjoys this unique distinction alone. Many friends inquired of J. J. Collins of St. Louis if there was anything serious preventing Mr. Hughes from being on hand.

* * *

Charles Criqui, Jr., Buffalo, N. Y., about a year old, was the youngest delegate and shared the honors of attention with Vice-President Kenrick. Nothing escaped the notice of this bright little man, and Mrs. Criqui, who is a favorite, was quite generally congratulated.

* * *

John B. Jones and W. H. Switzer of the Utica Heater Company, Utica, N. Y., were down in the interest of their line of steam and hot water heaters. They displayed a new boiler, the production of R. W. Jacobs of the Keystone Boiler and Radiator Company, Huntingdon, Pa., which combines cast iron and steel in its construction very effectively, securing a long fire travel, a large fire surface and a grate adapted for durability and for all parts of a square fire chamber clear. Fred. D. Johnson, their New York representative, lent able assistance in presenting the merits of their boilers.

* * *

N. E. Frost of the Wm. H. Page Boiler Company, Norwich, Conn., has always been identified with the type of construction presented in the Volunteer and All Right boilers, and has secured their installation in many important buildings.

* * *

The Keystone Boiler & Radiator Company, Huntingdon, Pa., was represented by R. W. Jacobs, who showed a Keystone boiler and also a Keystone three-column radiator with a shield to throw the warmed air out into the room and secure a more effective circulation. A new catalogue gives full particulars of both boiler and radiator. The company are making a two-column radiator in all hights, from 12 to 45 inches.

* * *

Quite a bunch of what was said to be Hindoo money found on the beach was purchased by W. M. Cosgrove of the A. A. Griffing Iron Company, Jersey City, N. J. After stamping the mystical word Bundy on it he distributed it as souvenirs to remind the recipients of the Bundy line of boilers, radiators and steam specialties.

* * *

A neat display of radiators was made by the Niagara Radiator Company, Buffalo, N. Y., in charge of C. F. Walther, E. L. Stock and E. E. McNair. One was a new six-column radiator made 16, 18 and 26 inches high, and another was the new Niagara wall radiator. These, with their three-column plain surface and ornamented radiator, were sufficient to attract a great deal of attention.

* * *

A No. 1 Mercer boiler and a new wall radiator were exhibited by the H. B. Smith Company, Westfield, Mass., and R. D. Reed and J. C. Faulkner had no difficulty in finding plenty who could testify to the merit of the boiler and who were willing to take chances on the efficiency of the radiator.

* * *

The Wisconsin Graphite Company, Pittsburgh, Pa., made a display of their pipe joint paste and gave small cans to the delegates for test. Secretary Fred. J. Shaler was assisted by Thomas R. Davis in distributing a little catalogue giving explanation of its various uses.

* * *

W. M. Mackay of the New York office of the Hart & Crouse Company and the New York Radiator Company, Utica, N. Y., secured the interest of the delegates in the Royal boilers and New York radiators.

The Paragon boiler, made by Isaac A. Sheppard & Co., Philadelphia, will be remembered as the result of many little chats with G. W. Barr and the new catalogue which he gave as a substantial reminder of its merits.

* * *

J. B. Bernhard represented the boiler branch of the business of Abendroth Bros., New York, and distributed attractive literature in reference to the boilers.

* * *

The merits of the varied line of steam specialties made by Kieley & Mueller, 7 West Thirteenth street, New York, were explained by Timothy Kieley and by James J. Brogan of Brogan & Co., 810 Race street, Philadelphia. They showed the Climax damper regulator, the new Kieley cantilever expansion trap, and models of the Mueller steam trap and a Kieley steam trap.

* * *

Steam pipe covering was the theme of many discourses by James B. Colladay, representing the Philip Carey Mfg. Company, Philadelphia, Pa.

* * *

The extended and newly equipped plant of the Vance Boiler Works, Geneva, N. Y., was explained as at the disposal of the steam fitters by James R. Vance, and a good impression was made by the presentation of a little tape measure in a celluloid case bearing a picture of the Vance portable boiler on one side and the company's brick set boiler on the other.

* * *

H. H. Hess of Detroit and R. C. Kriebel of Philadelphia, of the United States Heater Company, Detroit, were capital talkers and mascots for this line of steam and hot water boilers.

* * *

W. H. Clark distributed a very neat souvenir in the interest of the Sunshine line of heating apparatus, made in the "Sunshine Shop" by Orr, Painter & Co., Reading, Pa.

* * *

The United States Radiator Company, Dunkirk, N. Y., were represented by W. S. Appleton, New York; M. E. Danforth, Washington, and Harry S. Martin of the home office. "We have it in any number of columns you want and in all hights" is the way they talked radiators.

* * *

The Prizer-Painter Stove & Heater Company, Reading, Pa., were ably represented by H. T. Gates, manager of their New York office, and many found attractive features in the Henderson-Thermo line of heaters when explained by Mr. Gates.

* * *

To inqure about "168 Albany" is considered to be perniciously inquisitive by some who have not met practical jokers.

* * *

The American Radiator Company, Chicago, apparently arranged a family gathering. George Downe and Charlie Foster came from Chicago, Frank T. Bassett from Boston and C. H. Gott and E. F. Glove from New York, so that direct, semidirect and indirect attractions could be presented in such an Ideal manner as to be captivating when the time for the final order came.

* * *

Everybody knew that there was a Richmond in the field when Charlie Morrison came from Pittsburgh and J. S. Conrand and W. M. Brownback from Philadelphia to see that the new Richmond Company of Norwich, Conn., and the new magazine and surface burning line of Richmond boilers were properly and impressively brought to the attention of the heating contractors. The new Richmond catalogue tells it all.

* * *

Thomas Kelly of Thomas Kelly & Bro., Chicago, was the first to be on hand with an exhibit of plumbing goods. He showed the Kelly safety basin, but with the ocean so near at hand a lavatory had less attractions than it would have had in some other city.

* * *

F. C. Green of Brown & Green, Saratoga Springs, N. Y., showed the "Steam and Gas Fitters' Price Book," which contains illustrations of standard goods and gives standard list prices and net prices at several different discounts, with spaces for retail and jobbing selling prices and cost. It is a convenient book for the estimator.

* * *

H. D. Kellogg headed the Philadelphia contingent of the H. B. Smith Company, Westfield, Mass., followed by H. J. Walther and W. C. Jackson. Being from the Quaker City, their statements were plain facts on the boiler and radiator question.

* * *

A. C. Mercer, who came from New York, spent most of his time enjoying a renewal of old acquaintances. Of course he was too modest to talk the Mercer boiler.

* * *

The Powers Regulator Company, Chicago, were represented by W. W. Morgan and C. A. Morton. There is no occasion to waste the fuel purchased at coal strike prices if their temperature regulator apparatus is half what they claim for it.

THE HEATING ENGINEERS AT ATLANTIC CITY.

Already there is a good showing of the members of the American Society of Heating and Ventilating Engineers at Atlantic City—President A. E. Kenrick, Secretary W. M. Mackay, John Gormly, P. Gormly, Frank K. Chew, James H. Davis, H. A. Smith, W. H. Switzer, John C. F. Thrachsel, Enoch Rutzler, Henry L. Hall, James Curran, A. N. Chambers, Frank Dobson, W. H. Clark, A. B. Franklin, P. H. Kendricken and Stewart A. Jellett. The affairs of the society have been discussed with interest and there is a feeling of confidence in its growing importance. The tenth anniversary idea of Andrew Harvey evidently is a popular one, and although little has been accomplished as yet, the suggestions made show that it is an opportunity for good work. The meeting of the society on Monday will be well attended, and doubtless will interest some of the guests in its work as well as secure their support.

THE MASTER PLUMBERS ARRIVING.

The first of the master plumbers to arrive were the members of the Executive Committee and the officers. Thomas F. Gaynor and Mrs. Gaynor came on Wednesday, and in the evening ex-President P. Tierney and Miss Sarah Tierney. Later T. J. Young and Fred Fox, Jr., arrived. On Thursday President E. D. Hornbrook, Vice-President Chas. Polacheck, George Kirchoff, J. J. Foy, L. Poplowski, Treasurer W. E. Goodman and Executive Clerk W. E. Crosby arrived. They were received by V. B. Giffen, C. T. Schroeder, M. H. Towhey, L. E. Freeman and N. Cogan of the Atlantic City Association, who are a general committee to lend any assistance needed. Immediately matters of convention and of business relating to the conference were under consideration. The convention of next week gives promise of being a big one. There are several interesting matters for attention that will give it special importance.

West Virginia Master Plumbers.

At the meeting of the Master Plumbers' Association of West Virginia held at Parkersburg on Thursday, June 5, the following officers were elected for the ensuing year:

President, Robert W. Kyle of Wheeling.

First Vice-President, Charles H. Turner of Parkersburg.

Second Vice-President, S. H. Meyers of Charleston.

Secretary and Treasurer, William Hare, Jr., of Wheeling.

C. H. Turner of Parkersburg and F. D. Jones of Fairmont were chosen as delegates to the National Convention. The next meeting of the association will be held on the third Thursday in February next, at Wheeling.

TWENTIETH CENTURY PLUMBING.

Even as the twentieth century builder erects an iron skeleton and then incloses it in brick work and fills in the partitions, the plumbing trade has its representative on the job, who runs the service, waste and drain pipes before the iron work is completed. When Kiralfy wished to give a spectacular reproduction of the battles of Manila and Santiago in the Madison Square Garden, and did not desire to pay rent for several months in order to have the first floor of the garden made one immense water tank, the plumbing trade generally found no attractions in the contract that he had to offer, when the time limit was considered. The lining of that great tank with sheet lead in a comparatively few days made John W. Cooney of 355 West Twenty-sixth street, New York, well known to the plumbers throughout the United States, for the tank was not only the largest that had ever been built, but was completed on time, without leaks. The same enterprise for completing large undertakings in a short time has secured for Mr. Cooney the contract for plumbing the new building at Thirty-fourth street and Broadway, New York, which is being erected for R. H. Macy & Co. by the George A. Fuller Company, who have attracted attention by their large undertakings in contracting to furnish complete in a short time immense many story buildings all ready for occupation.

ADVANCED METHODS.

Mr. Cooney has employed methods in his plumbing business that are unique, interesting and successful. In conducting such large operations, he studies the plans and makes special detailed plans and elevations for all the plumbing work to be done, which are given to the foremen in charge, who distribute them among the journeymen, so that they need little supervision, but are required to work exactly to sketch. A clerk is placed on each large job to receive the goods that come in from the various houses supplying them. Heretofore all pipe, of whatever size, required on a job was ordered to be cut to sketch and tied in bundles with marks, so that when received it could be sorted, and when the journeyman was given his sketch in the morning he could be provided with all the materials he would require to complete his work for the day. This plan has enabled Mr. Cooney's workmen to run up the piping in a building as fast as the skeleton iron frame work is put in place. Thus the mechanics who put up the partitions, the carpenters, plasterers and all the other workmen are enabled to fit up to the plumbing work, saving them time and expense, and also time and expense to the owner.

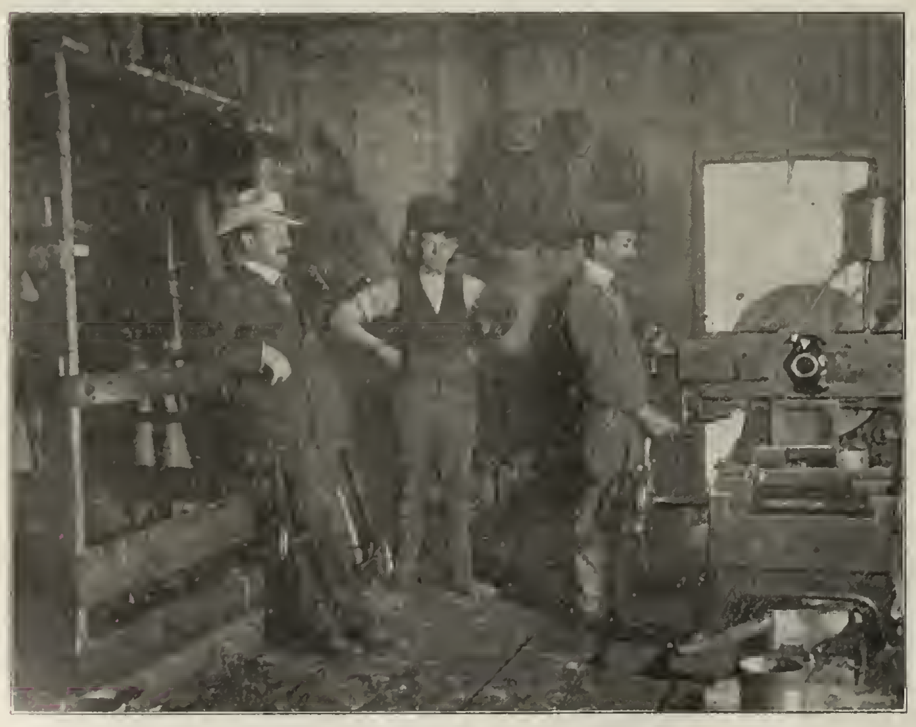

Fig. 2.—Electric Pipe Cutting Plant.

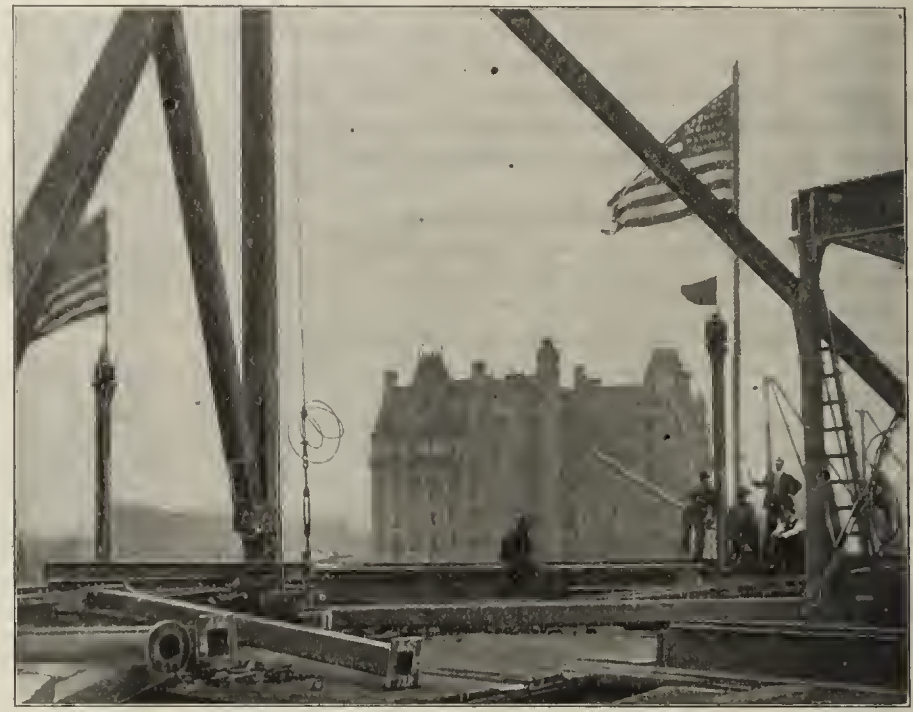


Twentieth Century Plumbing.—Fig. 1.—The American Flag Ahead.

CONTEST TO REACH THE TOP FIRST.

The plumbers who have worked for Mr. Cooney have become expert in this class of work, and at the Macy building a friendly rivalry sprang up between the plumbers and the iron framers, to see who should get to the top of the building first. The building is nine stories in hight, and when the ninth floor was reached the iron frame men were slightly ahead. They ran up at the top of one of the columns the green flag, so dear to the sons of Ireland, but before the roof line could be reached the plumbers were well ahead with their piping, and one of the pipes passing through the roof above the column bearing the flag of the iron framers was used as a staff on which to run up the American flag. The flag is shown in Fig. 1 of the accompanying illustrations, occupying the space above all others, which the plumbers' spirit and enterprise have enabled it to reach.

THE PLUMBING EQUIPMENT.

The building, when completed, will contain 600 plumbing fixtures, including shower baths, bathrooms and toilet rooms. Naturally, in so large a building, equipped with elevators and having so much machinery as is necessary in department stores these days, the engine and boiler room is in charge of several men, and the engineers have a special private bathroom, with shower bath. There is also a special bathroom, provided with showers, for the officers of the company. In addition there are eight shower baths in the various toilet rooms for the employees and in the emergency sick rooms, provided on the different floors. The building is furnished with a large restaurant, also an elaborate kitchen, with a complete system of plumbing. On the ninth floor is a fountain supplied with water from a tank on the roof, and the waste water from this fountain supplies a fountain on the seventh floor. The building is equipped with both a refrigerating and an ice making plant, and drinking fountains are located at numerous places on the different floors, the water being cooled by being continually pumped through brine tanks. The water supplied to the building passes through two 8-inch Loomis-Manning filters.

THE PIPING.

So many fixtures necessitate a large amount of pipes, there being eight 8-inch sewers leading from the building and four 4-inch water supply mains connected with four pumps leading to a number of tanks having an aggregate capacity of 50,000 gallons. The water is distributed from the tanks through a series of down mains connected with a 7-inch distributing header on the top floor. Hot water is supplied to all the various toilet rooms, bathrooms, &c., from a water heater in the cellar. The hot water main leads directly to the top of the building and runs to distributing down mains, which connect in the cellar and lead back to the heater, so that a continual circulation is kept up. The drainage system is composed of galvanized wrought iron pipe with recessed fittings.

ELECTRIC PIPE CUTTING PLANT.

Mr. Cooney is under contract to complete this work in August, although it was only begun in April. In order to have the best facilities under his own control for getting out the piping, instead of ordering it cut to sketch at the mill as heretofore, he equipped the pipe cutting and threading shop shown in Fig. 2. At the left of the picture is an electric motor, from which belts run up to shafting on the ceiling, and connect to a Saunders pipe cutting machine, having a capacity for cutting and threading pipe up to 8 inches in diameter. This shop is in charge of a competent pipe machine man, and is run to the best advantage of the plumbers working upon the building. A blackboard is provided in this shop, on which the orders from the different workmen are recorded, and the pipe got out at the earliest possible moment.

COLLECTING THE MATERIAL.

Although the work was only started in the latter part of April, already, on the 7th of June, 245 tons of wrought iron pipe and $7500 worth of cast iron fittings had been installed in the building. In order that so much pipe and so many fittings and supplies should be secured promptly, so that there should be no delay in the work, Mr. Cooney employed a special man to travel among the various pipe mills and supply factories where he had placed orders, to see that the goods were shipped and then notify Mr. Cooney of their shipment. When special material had been needed urgently, advanced prices have been paid for material already packed for shipment to other parties, in order to have the material unpacked and shipped to New York for this particular work.

THE WORKING FORCE.

The crew for working on the building is composed of 50 journeymen, 50 helpers, 1 general superintendent, 1 foreman, and 1 foreman helper. The superintendent and foreman have been given *carte blanche* to employ all the men needed to keep the plumbing work ahead of all other work, regardless of expense. This has resulted in the entire crew developing *esprit de corps*, which enabled them to pass their work through the roof first and establish their much-loved star spangled banner at the place where it belongs—at the head of the heap. In addition to the working crew, the timekeeper is one of the important members of the clerical force, who have such complete mastery of the details as to be able to tell when a certain fitting or material will be needed, where it has been ordered, and at what point it may be —either in transit, on the dock, or on trucks, on its way to the building.

HANDLING THE MATERIALS.

This building, which is 200 x 500 feet, and nine stories in hight, and is to be completed and ready for use as a department store in August, is progressing so rapidly as to approximate the mushroom growth so often spoken of. Yet, while a veritable hive of industry, it is absolutely free from confusion. To better facilitate its construction the Fuller Company have erected in the basement, near to Mr. Cooney's shop, a complete electric generating plant, from which he secures the electricity needed for his motor. The Fuller Company also have all the necessary derricks for handling their material, and for a small charge handle heavy materials received by other contractors. When a truckload of 5 tons of wrought iron pipe reaches the buildings it is drawn into the building by means of the power plant and one of the derricks is used to lift off the 5 tons of pipe and put it at the desired spot, for the use of Mr. Cooney's men, just as easily and readily as one man would handle one length of small sized pipe.

THE PNEUMATIC SWEEPING SYSTEM.

Another feature of the equipment of the building, for which Mr. Cooney is running the piping, is a vacuum sweeping system. Pumps and machinery are provided in the basement for creating a vacuum in two tanks, one of which is a settling tank, in which a spray of water separates the dust drawn in from the air and prevents the dirt from clogging the apparatus. Pipes from these tanks lead to various points on the different floors, so that each pipe, with its hose connection, takes care of about 100 square feet of floor space. At the end of the hose is a special device for drawing in the dust, consisting of a short piece of pipe leading to a tee. At the bottom end of the tee is a short cross section of pipe slotted so that there is a continual inward suction, and when passed over a floor or piece of carpet it draws in all the dust on the floor or carpet, without creating any dust and leaving the nap of the carpet standing straight.

Plumbing work of this character, for so large a building, done under such conditions in such a short time, and conforming to every sanitary requirement, is radically different from the plumbing in which the old timer found so much delight, when every joint was wiped, and he had ample time to beat up his work, as well as enough time to work in some elaborate ornamentation.

The No. 35 Gasoline Torch.

We present herewith an illustration of the No. 35 torch made by the Clayton & Lambert Mfg. Company, Detroit, Mich., which they have just placed upon the market. This torch is of 1-pint size, and is of the most modern and improved construction in every respect. The tank is drawn out of heavy brass, free from seams, and all fittings are heavy, reinforcements being used to make the tank extra strong. A brass air pump of the latest design forms part of the handle. The burner produces a strong blue flame, consuming very little gasoline. In fact, the manufacturers claim that the user will soon save the cost of the torch in the saving of gasoline. The company's improved double shouldered needles are used in this torch, making durable burners. As will be seen from the cut, the burner is mounted on a swivel joint, so that the flame can be blown in any direction. The No. 35 torch is thoroughly well made, and though strong is light and well balanced, easy to handle, and always ready for use. It is adapted for the use of plumbers, tinners, painters and electricians.

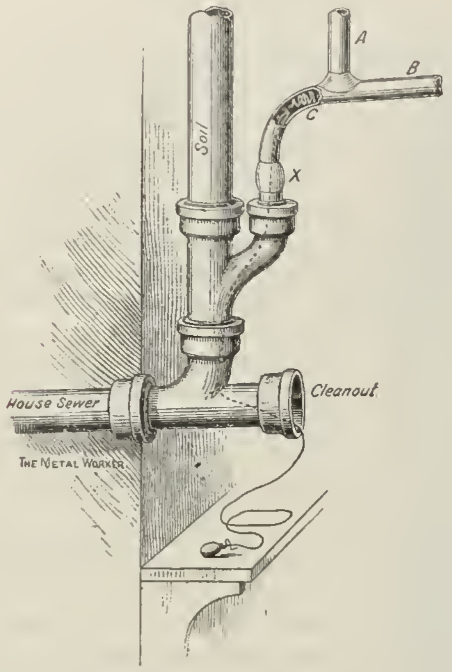
The No. 35 Gasoline Torch.

FRED. A. PARKS and A. P. STEWART have been granted plumbers' licenses, at Old Town, Maine.

DRYING PIPE BEFORE WIPING JOINT.

BY HELMAR.

The value of a plumber's services to his employer depends largely upon how rapidly he can get along and at the same time do good work. The sketch herewith shows a scheme that has saved many hours of worry and work over trying to make joints on wet pipes. If a joint, as at X, or the bend, gives way, or a new waste is to be branched into an old lead waste, there is usually trouble in getting the pipe dry, and, as there is no pressure on the waste pipe to blow out bread plugs, the plumber must be careful as to what means he employs to keep the water back. The interior of old waste pipes is always slimy and harbors more or less water from end to end, which will trickle down, make steam, cool the solder, blow it off and make the poor plumber miserable. Incidentally he uses all his solder without getting up a heat, has to reheat the pipe and burns the face off of his coppers trying to melt the cold solder off by the time the pot gets hot. And it is likely he has no solder to heat until he melts it off of the pipe with the iron.



Drying Pipe Before Wiping Joint.

The writer's plan is to take a long strip of strong, dry rag, attach it to a string with a lead "mouse" on the end, drop the mouse in at the branch hole or where the joint is to be rewiped and fish it out at the clean out. The rag strip is then folded back and forth, as indicated at C. It should be folded about the size to make a plug that will push into the pipe tight, but which will come out easily by pulling on the string at the clean out. The rag plug is then shoved into the pipe tail first and pushed up above the point at which the joint is to be made. The waste should be swabbed out with a cloth on a wire as far up as possible before putting the rag in. The plan will hold water back in pipes A and B, no matter how long they are, unless a regular deluge is turned loose at one of the fixtures, a mishap which there is some chance to guard against. In this way the joint is as easily wiped as on new pipe, and the rag and string come out as easily as though it was a straight string.

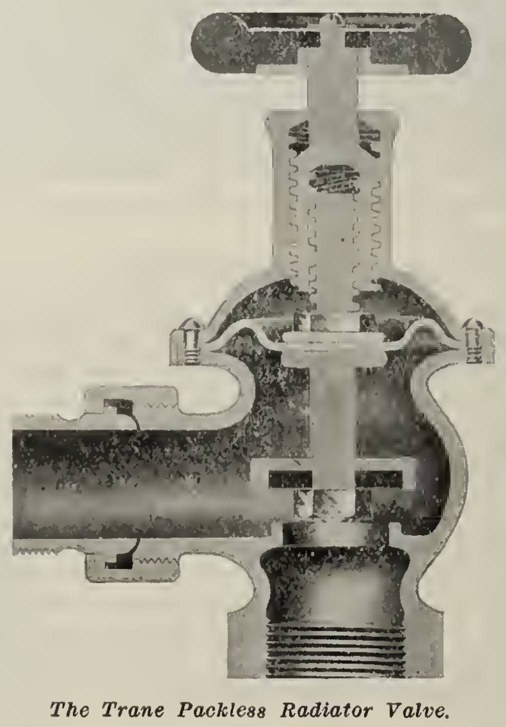
Pushing the Thatcher Line.

The Thatcher Furnace Company, 240 Water street, New York, are not waiting for the busy tradesman to stumble over the good things presented in the Thatcher line, but are making direct appeals that are well calculated to secure his attention. The following copy of one of their letters shows how a clever correspondent can awaken interest in his goods while attending to the thousand matters that gather around the desk of an industrious man who has command of all the details of his business:

> Do you wish to increase your business? We can help you. Are you using the right line of goods? Just think it over for a moment.
>
> We cannot understand why you are not using the Thatcher line of furnaces, ranges, steam and hot water heaters. Goods that are easily sold because they have real merit and established reputation.
>
> They are known to be of superior construction and workmanship, beautiful in design and efficient and economical in operation. Thousands of successfully heated homes attest this. Dealers handling them are making money and steadily increasing their business. It is your fault if you are not doing the same.
>
> As manufacturers, we sell only through the trade and do no construction work or installing whatever, thus protecting the interests of our customers—remember this.
>
> Our prices will enable you to meet all competition and you will be accorded fair treatment.
>
> These are hard facts which should appeal to your good business judgment. Our next letter will give more reasons why we are entitled to at least a portion of your business.
>
> Write us now for prices and further particulars. You will receive a prompt and helpful response.

The Trane Packless Radiator Valve.

In the accompanying illustration we show what is designated by the manufacturers as a practical radiator valve, being constructed with a right and left hand thread spindle and diaphragm, thus doing away with the ordinary stuffing box, which usually is the cause of great annoyance to the steam fitter. This feature will be especially appreciated by those interested in vacuum heating. The inventor believes that the valve is one of the first, if not the first, packless radiator valves placed on the market. It is claimed to be thoroughly practical and durable. The manufacturers are the James A. Trane Vacuum Heating Company, 42 Dearborn street, Chicago.



The Trane Packless Radiator Valve.

Journeymen Steam Fitters.

The National Association of Journeymen Steam and Hot Water Fitters, at their convention in Philadelphia last week, elected the following officers:

President, T. C. McCormick of Yonkers, N. Y.

Secretary and Treasurer, V. L. Onstatt, Chicago, Ill.

Member of Executive Board, J. N. Coughlin, Boston, Mass.

PETER MILNE, Water Purveyor of Brooklyn under Mayors Low, Schieren and Wurster, and Chief Engineer of the Brooklyn Water Department under the last named executive, died on Monday, June 9, at his home, 32 St. James Place, Brooklyn. Mr. Milne was born in that city 65 years ago, and for many years was associated with his father in the plumbing business. For the last few years he had acted as consulting engineer for a number of contractors. He was a member of the American Society of Civil Engineers, and was connected with several trade and social organizations. He leaves a widow, three daughters and one son.

New York City Notes.

Contracts still continue to be given out, and now that the wage question is settled, the trade are on a better foundation to figure. Among the jobs lately given out is an apartment at 236-238 West Fortieth street, to be done by Wm. V. Gordon; James Patten has two private houses at 155-157 East Fifty-seventh street; Frank Woytisek has an apartment on 112th street, between Amsterdam avenue and Broadway, and Habeck & Fajens of 773 Melrose avenue have seven private houses on 209th street, near Amsterdam avenue. T. A. Klenke began work on an apartment on 127th street, between Lenox and Fifth avenues; also one on Forty-sixth street, between Fifth and Sixth avenues.

* * *

John McMillan is busy with overhauling the plumbing in the Brooklyn post office. He has been hampered in this job on account of a strike against so-called nonunion marble, but work is again progressing.

* * *

The boys employed by Milton Schnaier on the Ansonia struck last week for an increase of wages, and as a consequence most of them are now looking for a job.

* * *

The New York delegation to the convention will have with them, as delegates and guests, Hon. P. M. Stewart, Superintendent of the Bureau of Buildings of the Borough of Manhattan; P. J. Andrews, Chief Plumbing Inspector; Alderman T. F. McCaul; James G. Collins, Superintendent of Highways of the Borough of Manhattan, and William Montgomery, president of the Examining Board of Plumbers.

* * *

The Tracy Plumbing Company have fine new quarters at 216 West Twenty-third street, and are busy getting out the Ellis subdrain lifts for the stations on the rapid transit railroad.

* * *

The New York train for Atlantic City leaves by way of the Central Railroad of New Jersey from the foot of Liberty street, Manhattan, at 3 p.m. sharp on Monday, the 16th inst. Baggage should be marked care of Master Plumbers' Special.

Heating and Plumbing Notes.

President Lynch of the International Metal Polishers' and Brass Workers' Union is authority for the statement that a co-operative company will be formed by the metal polishers and brass molders who are on strike in Cleveland, with a view to competing with Plumbing Supply shops where men are on strike. The International Union is expected to take between $5000 and $10,000 worth of stock, and the remaining stock will be sold to workmen at $10 per share. It is stated the matter is now before the Executive Board of the International Union.

The Memphis Association of Master Plumbers is the name of a newly incorporated body at Memphis, Tenn. The incorporators are: L. Tisdale, Edward McGowan, Harris L. Browne, Edward L. Rawlings and B. P. Stanton. The association has a capital stock of $1000.

The County Commissioners at Great Falls, Mont., have awarded the contract for heating the new Court House to C. E. Wentworth of Butte, Mont., and Minneapolis, at his bid of $10,500.

Oliver & Howland are now in their new establishment at 214 Worthington street, Springfield, Mass., where they are making a fine display of Bathtubs and their equipment and Lavatory Fixtures. They show a bathroom completely furnished with the latest design of Fixtures and Trimmings.

Recent callers at the office of the Curtis & Curtis Company, Bridgeport, Conn., have admired the beautifully engraved certificate setting forth that a medal was awarded to the company for their exhibit of Pipe Threading Machines at the Paris Exposition in 1900. The certificate was lately received from the United States Commisioner to the Exposition, and has been handsomely framed.

Bids will be received until June 17 by Joseph H. Key, secretary of the Board of Trustees of St. Mary's Female Seminary, Leonardtown, Md., for the heating plant for a three-story brick building, 75 x 30 feet.

The Alton, Ill., Board of Education has awarded the contract for plumbing the High School Building in that city to the Alton Plumbing & Heating Company, and the heating contract to the Keer Construction Company of Belleville, Ill.

F. W. Barclay, Beatrice, Neb., bid $15,000 and secured the contract for plumbing the City Hall at Colorado Springs, Col.

The *Republican* of Cedar Rapids, Iowa, reports that there is a movement on foot at Waterloo, Iowa, to unite the master plumbers of the city into a stock company to carry on a supply business.

The Hewitt Plumbing & Heating Company of Grand Rapids, Mich., have applied to the City Council for an immediate re-examination to secure master plumbers' licenses, they claiming to have secured a credit of 100 per cent. on practical work.

The warehouse of the Sumner & Goodwin Company, at 289 Congress street, Boston, Mass., containing Plumbing Supplies and Materials, was recently slightly damaged by fire.

The School House Commissioners of the city of Boston, Mass., have invited proposals for installing a plumbing system in the Quincy School on Tyler street, Boston. Bids must be sent to the office of the commissioners in the Walker Building, 120 Boylston street, Boston, not later than noon of June 16.

The Library Board of Miles City, Mont., have let the contract for the plumbing and heating of the library building in that city to Miles & Ulmer at their bid of $1366.

Sealed proposals will be received until June 20 by the Building Committee of the Board of Supervisors of Jefferson County, N. Y., at the office of D. D. Kieff, Flower Building, Watertown, N. Y., for the plumbing, heating and ventilating of the new County Court House, now being constructed in that city.

A delegation of master and journeymen plumbers of Seattle, Wash., recently waited on the local Board of Health to ask that Plumbing Inspector McIntyre be given one or more assistants, to enable him to keep up with his work. The plumbers claim that at the rate at which houses are being erected in Seattle it is a physical impossibility for Mr. McIntyre to inspect the plumbing work, and therefore the work of building is often delayed. In support of their claim the plumbers cited the fact that San Francisco has one plumbing inspector and six assistants, while there are two-thirds more buildings going up in Seattle than in San Francisco, with only one man to inspect the work in the former city. The board promised to consider the application.

The Burley Heater Company, Tyrone, Pa., were reorganized on April 19 with new capital. The president is William H. Denlinger, vice-president James H. Alports, and secretary D. S. Kloses. An additional building is being erected by which the output of the concern will be largely increased. It is said that water power far beyond requirements can be had from the Juniata River and sand necessary for molding is found near the works on the property of the company. Their leading product is a Sectional Boiler, suitable for steam or water, and is made in three series. It is adaptive to either a severe or moderate climate, and has proved satisfactory to purchasers as far East as Bangor, Maine; West as Independence, Wis., and South as Asheville, N. C. The company are anticipating a greatly increased sale for their Boiler. Two illustrated catalogues will be issued within a few days.

The prolonged strike of plumbers in Washington, D. C., has been settled, and the men returned to work on Tuesday. The terms of the settlement provide for two helpers to every three plumbers. The strike was based on the question of helpers, the men asking for the abolition of helpers, while the master plumbers claimed the right to employ as many as they wished. In the agreement apprentices are looked upon as journeymen. The strike has run for more than nine weeks.

The Board of County Commissioners of the county of Randolph, Ind., will receive sealed bids until June 21 for furnishing the material and installing the plumbing in the County Court House at Winchester.

Sealed proposals will be received until June 20 for furnishing and installing a plumbing system in a school house at Springfield, Mass. Plans and specifications for the same may be seen at the office of the architects, E C. & G. C. Gardner, 33 Lyman street, Springfield.

The School Board of Van Buren, Ark., have decided to put a steam heating plant into the public school building in that town.

Over 3000 tons of Iron Pipe were exported last month via Eastern ports by the National Tube Company, being an increase of nearly 50 per cent. as compared with the company's exports made during April. Europe was the most important purchaser, 2016 tons having been shipped there.

The Southern Sewer Pipe Company, Chalifoux Building, Birmingham, Ala., will shortly be in the market for an electric light outfit, tank and fire protection equipment and belt power elevator. The company are erecting a large terra cotta sewer pipe plant at North Birmingham, consisting of a main building, 61 x 301 feet, three stories, of frame construction, with single story addition, 40 x 96 feet, and a brick and iron power house, 40 feet square, in which will be installed a 250 horsepower Corliss engine and four 100 horse-power boilers, which have been purchased. The special machinery was purchased from Taplin, Rice & Co. of Akron, Ohio. The plant will include 20 30-foot down draft kilns and will have a capacity of 100 cars per month.

The Pressed Steel Tank Company, Milwaukee, Wis., recently incorporated with a capital stock of $100,000 by Robert H. Hackney, Frank G. Bigelow and George C. Markham, have purchased the entire plant, equipment, accounts and business of the Seamless Structural Company.

The Buffalo Forge Company, through their New York office, closed a contract with the New York Edison Company involving 16 large Fans, to be used in connection with forced draft apparatus at the new Waterside station.

The Davis-Hansen Company, Oshkosh, Wis., are manufacturers of Iron Pumps, Cylinders, &c. The company also job Pipe, Fittings, Tools, Well Supplies, &c. Among goods recently added to their line of manufactures are Brass Body Pitcher Spout Pumps, Pipe Holders and Lifters, Brass Body House Force Pumps, and Long Fulcrum Lift and Force Pumps.

The American Tool Chest Company, 200 West Houston street, New York, have just put on the market a new line of Machinists' and Pipe Fitters' Tool Chests. These Chests are made in a number of styles and sizes.

The John Davis Company, Steam Fitters' Supplies, Chicago, Ill., who have been located at 75 Michigan street for a number of years, will erect a plant, costing $200,000, at Twenty-second and Halsted streets, and upon completion will transfer their business to the new location. The works will comprise a warehouse at the southeast corner, four stories high, with ground dimensions of 167 x 256 feet; several buildings, including machine shops, power house and sheds, will occupy a frontage of 250 feet on Twenty-second street and 570 feet on Union street. Next this property, but separated from it by an 18-foot driveway, a large warehouse will be erected for Burley & Tyrrell. It will be five stories high, of mill construction, and will cost about $90,000.

The contract for the plumbing of the High School at Greene, N. Y., has been awarded to F. E. McCormack & Co. of Lestershire, N. Y. They will use the fixtures manufactured by the L. Wolff Mfg. Company of Chicago.

P. B. Oakley, for 15 years associated with the Pease Furnace Company of Syracuse, N. Y., and who has been with the International Heater Company since their organization, has now made a business connection with the Eckerman Hardware Company, 1026 Lorain street, Cleveland, Ohio. The company's plumbing and heating department will be greatly enlarged under Mr. Oakley, who is well known by the trade throughout Ohio and the Ohio River towns of West Virginia.

The Keystone Valve & Mfg. Company, recently organized in Pittsburgh, Pa., will build a large plant for the manufacture of Valves and Light Machinery. A number of sites for the location of the plant are under consideration, but no definite selection has yet been made. The officers of the company are J. D. Riley, president, and William A. Larimer, secretary and treasurer. These, with Stephen McKay and M. O. Schooley, compose the Board of Directors.

J. H. Seacord & Co., Lincoln Place, Pa., have removed their plumbing shop to a new building on Marion avenue, where they expect to make a better display of their line of goods.

Bids will be received until June 18 for plumbing the City Hall of Newark, N. J.

Rourke Bros., New Haven, Conn., have closed the contract for the steam fitting, air piping and plumbing in the new Lion brewery in Allington, Conn. The cost of the work will be between $9000 and $10,000.

Bids are being invited for furnishing 1500 ⅝-inch water meters for the San Juan Water Works, Porto Rico.

We have received from President E. D. Hornbrook of the National Association of Master Plumbers, from the headquarters in Kansas City, Mo., the sixth edition of the "Directory of Recognized Master Plumbers," revised to June 1. This issue of the Directory contains practically four more pages, indicative of an increase in membership to the National Association during the last month.

The Crane Company of Chicago, Ill., whose New York offices are at 490-502 Cherry street, have recently shipped ten carloads of Pipe and Fittings to East London, South Africa, for use in the mining district near Johannesburg.

J. Reilly, Jr., has removed his plumbing establishment from 251 State street to 283 State street, Bridgeport, Conn.

The Walker & Pratt Mfg. Company, Boston, Mass., are sending to the trade a mailing card showing broken views of the 15 and 20 Series Walker Vertical Sectional Boilers, and general views of the Crawford Steam and Hot Water Boilers. The company offer to send further information in reference to these Boilers on application.

New Firms and Changes.

Leon P. Page & Co. have opened a plumbing and tinsmithing establishment on Main street, Indian Orchard, Mass.

P. L. Lyons has arranged to go into the plumbing business at Montpelier, Vt.

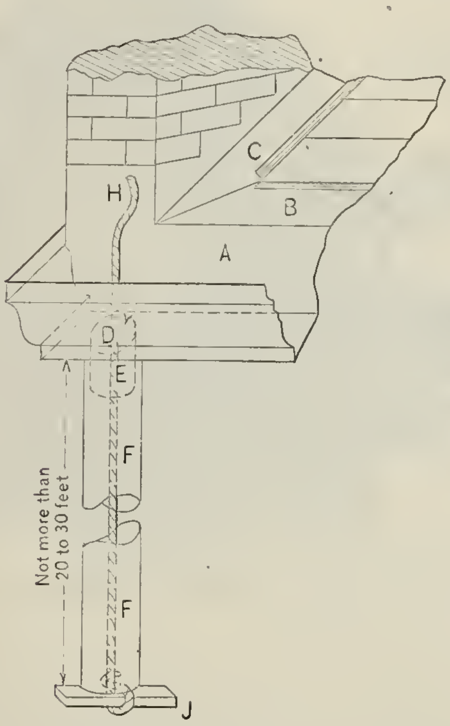
H. M. Cawley succeeds the plumbing firm of Kelley & Cawley, at Peabody, Mass.

The Sterling & Skinner Mfg. Company, Detroit, Mich., recently organized with a capital stock of $25,000 for the manufacture of Brass Goods for Steam, Water and Gas, are erecting a two-story brick factory 50 x 100 feet, which will be equipped with latest improved machinery, an 80 horse-power engine, and a 100 horsepower boiler. It is expected that the plant will be ready for operation by July. The officers are R. R. Sterling, president; E. J. Roney, vice-president; F. G. Skinner, secretary and treasurer, and J. F. McDougall, superintendent.

The Steele & Robinson Company, who have recently been incorporated at Williamsport, Pa., with a capital of $50,000, will remodel the plant formerly used for making the Backus Heater to suit their business. They will engage in the manufacture of Gray Iron Castings, Radiators and Steam and Hot Water Heaters, and expect to employ 50 men. George P. Steele has been elected president and general manager, and will have charge of the business and reside in Williamsport. William J. Robinson is the secretary and treasurer, and will have charge of the office and salesroom in Philadelphia.

PUTTING UP CONDUCTOR PIPES.

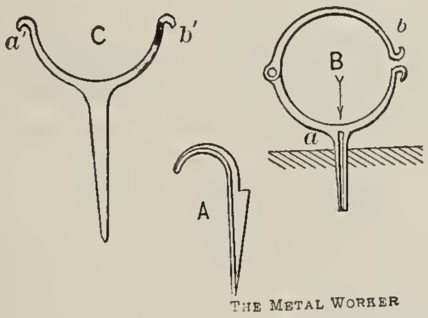
While the method here shown may not be new to some of the older members of the craft, it may, however, prove of interest to younger workmen and future mechanics, for whom it is intended. In putting up conductor pipes or leaders, where a foothold can be had on the roof, the gutter A in Fig. 1 is first put in position, flanged over on the roof B and connected with the wall flashing C. Assuming that a 5-inch pipe is required, cut a 5-inch circle through the bottom of the gutter, as shown by D, and solder into it a tube about 8 inches long and 4⅞ inches diameter, as shown at E. Let us suppose that the distance from the gutter to the ground is 50 to 60 feet. Then take three lengths of pipe, each length being 10 feet, and solder them together well, making 30 feet in one length. Now lower the rope H from the roof through the tube E to the ground, and pass it through the pipe F F by fastening a weight to the end of the rope; then tie a strip of wood, J, to the rope, as shown.



THE METAL WORKER

Putting up Conductor Pipes.—Fig. 1.—Method of Putting up the Pipe.

The rope is now slowly drawn up, being careful to support the pipe in the center as it is being raised, so as to keep it from breaking, until it has reached a vertical position; when it is drawn up tight against the bottom of the gutter. Then, from a nearby window, ladder, or sitting scaffold, the leader hook A in Fig. 2 is used to fasten the pipe against the wall, when the rope can either be dropped through the leader in Fig. 1 or the wooden strip J unfastened and the rope drawn up. When the hinged hook B in Fig. 2 is employed the hooks must be driven into the wall before the leader is put up.



THE METAL WORKER

Fig. 2.—Three Different Kinds of Hooks.

Care must be taken that each hook is directly above the one under it to keep the leader in a plumb line. This is accomplished as follows: Mark the center of the back of the tube in the gutter, as shown by the arrow in Fig. 1. From this point drop a plumb line through the tube and drive the hook B in Fig. 2 so that the line will come in line with the arrow point in hook B, being careful that all hooks project the same distance (*a*) from the wall line. This being done, the leader is placed in position, the front half of the hook closed, and the two small clasps fastened with wire and plyers at *b*.

The same instructions apply to the hook C, to which, however, the leader is fastened by hooking a wire at *a'*, passing it around the front of the leader and fastening at *b'*. In driving these hooks a ladder or sitting scaffold is usually employed.

◆

Of Interest to Metal Roofers.

The New York Iron Roofing & Corrugating Company, Jersey City, N. J., have issued a new illustrated catalogue of 96 pages, covering their line of steel roofing and siding, roofing materials, &c. The catalogue is of handy size, 8 x 9 inches, is well printed and illustrated and is inclosed in a violet cover artistically decorated. Among the goods shown in this publication are pressed, standing seam, V-crimped and roll cap roofing, corrugated, oval and corrugated Diamond siding; corrugated awnings, corrugated ceilings, cornice gutters, down falls, window and door caps, sheet metal clapboarding and steel pressed brick and rock faced siding. These goods are manufactured from the first quality of sheet steel, either black or galvanized, and are recommended by the manufacturers as suitable for buildings of every description. A number of pages are devoted to illustrations showing the method of applying iron roofing to roofs of various styles and pitches; also rules of measurement for roofing materials and a number of tables of weights and measures, which will be found useful to the roofer.

Among the goods presented further along in the catalogue are sheet iron angle forms, corrugated combing cap and flashing, cornices, ceilings in the Empire and Colonial styles, corrugated copper and zinc sheets, bas relief plates and stamped side wall panels. Special attention is called to Sagendorph's Obelisk metallic paint, which the makers claim to be especially adapted for use on metal roofs, having remarkable qualities as a preservative of metal. Obelisk iron cement is another product of the concern, which is recommended for the use of those undertaking roofing work. The company also manufacture and furnish a large line of roofers' tools, including shears, snips, seamers, mallets, squeezing and edging tongs, brushes, trowels, hammers, &c. Their Cluster steel shingles for mansard roofs and siding are illustrated and described with full directions as to their application. The closing portion of the work is occupied by galvanized steel headers, O. G. hanging gutters, eave trough, eave trough miters and ends, corrugated expanding conductor pipe, conductor hooks, elbows and shoes, and the Chautauqua eave trough hanger. A view of the company's factory at First and Washington streets, Jersey City, N. J., occupies the back cover. They have also recently issued a large illustrated catalogue of their steel ceilings and side wall coverings.

The New York Iron Roofing & Corrugating Company advise us that, in the past six months, they have increased the facilities for turning out sheet metal goods at their Jersey City works. Among recent additions and improvements to their equipment is a new gas engine, a large new corrugating machine of the latest improved design, new corrugating and curving rolls and a number of new crimping machines. They have also put up a quantity of new shafting, pulleys, &c., and have increased their capacity for painting sheets.

◆

We understand that the Automatic Closing Fire Proof Window Frames and Sash, which are made under H. Collier Smith's patents by the Smith-Warren Company of 93 Federal street, Boston, Mass., and 253 Broadway, New York City, have been specified for the Chelsea Telephone Building, to be erected in New York City in accordance with plans drawn by Silas L. W. Eidlitz, architect, with offices in the Townsend Building, that city.

Artistic Sheet Metal Work.

The use of sheet metal for decorative purposes is increasing very rapidly and a growing number of concerns are devoting their efforts to the production of artistic work in this line. The Edwards Mfg. Company, makers of architectural and ornamental statuary, sheet metal work and zinc, copper and spun work, with offices at 119 Sycamore street, Cincinnati, Ohio, and factories in that city and at Covington, Ky., are turning out some exceptionally handsome designs in this line. We present herewith three examples of the work of this concern. In Fig. 1 is given a representation of the crest of the State of West Virginia, stamped out of copper, for the Capitol Building at Charleston. This design is further embellished with a scroll, which, however, is not shown in the picture. The design measures 4 feet 4 inches by 10 feet 6 inches, and is regarded as an unusually fine piece of workmanship. The panel shown in Fig. 2 is 6 feet square and is stamped in bold relief out of zinc and copper. It was specially designed for a large structure in Pittsburgh, Pa., and is a very handsome piece of ornamental work. Fig. 3 is a pedestal surmounted by a bust of the late President McKinley. This is made entirely of sheet metal and, as the engraving indicates, is as artistic a piece of work as can be produced in this material. The company report that they are extremely busy on work of this character at the present time, and have a large number of orders on their books.

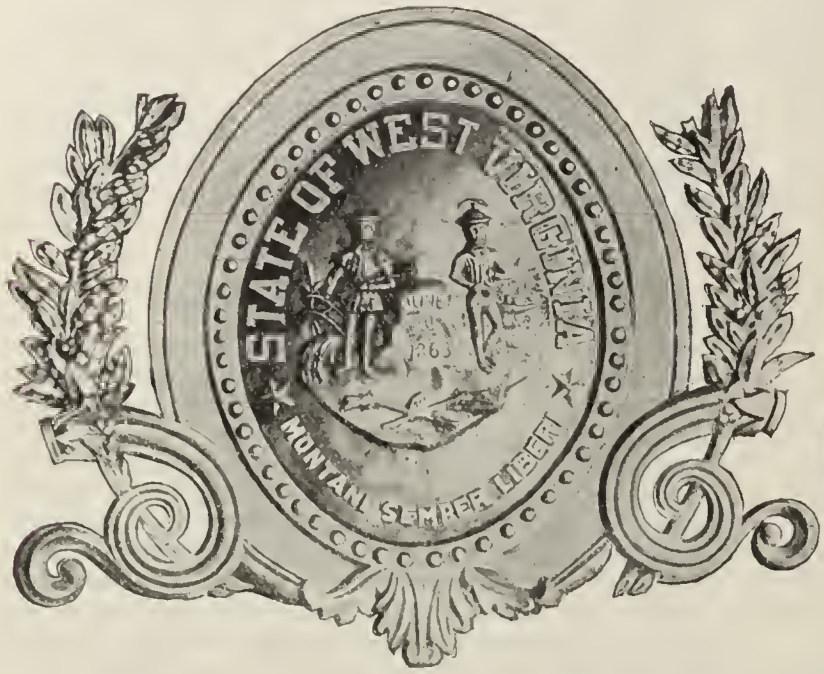


Fig. 1.—Crest of State of West Virginia in Sheet Copper.

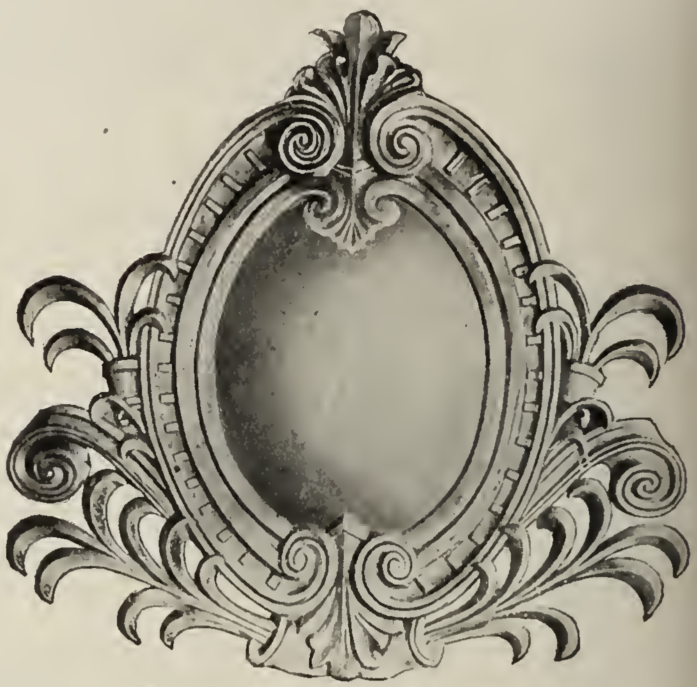

Fig. 2.—Zinc and Copper Panel.

Artistic Sheet Metal Work.

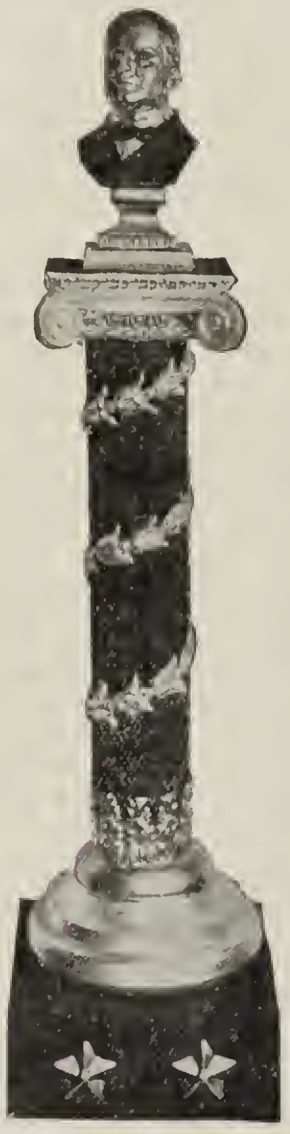

Fig. 3.—Sheet Metal Pedestal and Bust.

Metal Shingles and Tiles.

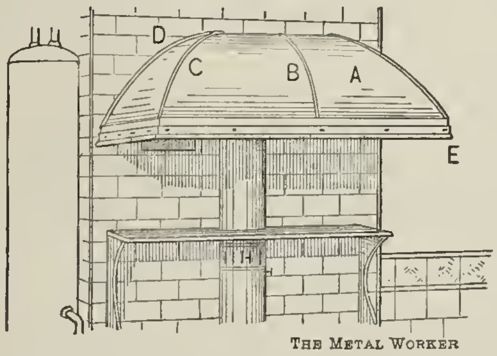
The Montross Metal Shingle Company, Camden, N. J., have favored us with a copy of their latest catalogue and price-list, illustrating the company's metal shingles, tiles and roofing sundries. The publication is composed of 36 pages printed in two colors and profusely illustrated with half-tone engravings, including views of residences and public buildings on which the company's metal roofing specialties have been used. The first portion of the book is devoted to a description of the advantages of metal for roofing purposes, special attention being called to the relative values of the different sheet metals for roofing, as compared with other materials. Among the company's specialties to which prominence is given are their Victor metal tile, their Gothic, and Diamond tiles and the Eastlake and Octagon shingles. Metal siding, Japanese hip caps, valleys and roof gutters are also treated, as well as ventilators, galvanized iron conductor heads, finials, expanding conductors, elbows and shoes, miters, end pieces and galvanized iron slip joint gutters. All these goods are made in both tin and galvanized iron, the tin shingles and tiles being thoroughly painted on both sides with the best oil paint. The Octagon shingle is designed for buildings where special ornamental roofing is desired, while the Victor shingles are sold at a moderate price, costing about the same as the ordinary wood shingle, slate or tin roofing. All of the company's metal shingles and tiles are furnished with the Montross telescope side lock, which is claimed to make an absolutely effective joint.

The company send out with their catalogue an attractive little pamphlet entitled "Practical Roofing," which gives directions for the application of their metal roofing specialties. A folder gives information about their Eastlake roofing paint, made in four colors—red, brown, black and slate. This paint is especially prepared for metal shingles, tin and iron roofs, smoke stacks and all metal surfaces exposed to the action of the weather. It is furnished with a five years' guarantee, and is claimed to be free from risk of blistering, cracking or granulating, and is claimed to be acid and alkali proof. It also stops leaks of not more than ⅛ inch in size.

PATTERNS FOR RANGE CANOPY.

(Without Allowance for Laps.)

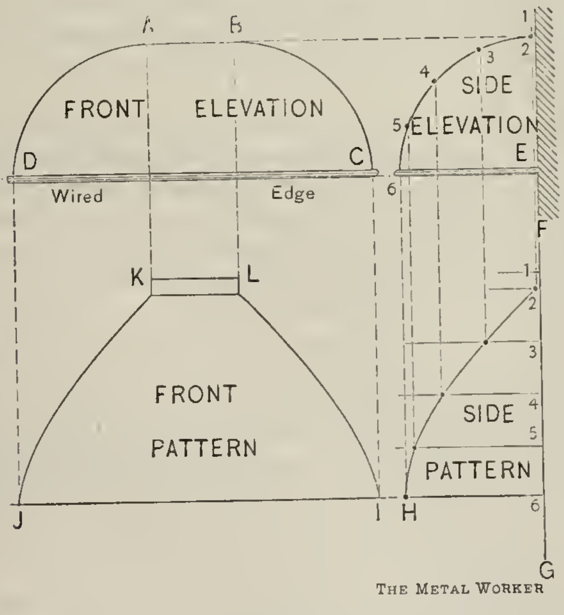
There is, perhaps, nothing in the sheet metal worker's line that so quickly attracts the eye in a well regulated kitchen as a neat, well proportioned range canopy, such as is shown in Fig. 1 of the accompanying cuts. When made of planished sheet iron, or sometimes of planished sheet copper or brass, it becomes an ornament as well as a canopy to catch the fumes from the cooking, for which object it is primarily intended. In Fig. 2 is shown how to develop the patterns for a range canopy. If the front and side view or profile are similar it is only necessary to draw the side view, from which obtain the pattern and then make the front pattern as long as desired, using the miter cut of the side. In this case, however, the front and side elevations are drawn so as to give a clear understanding of every step taken.



THE METAL WORKER

Patterns for Range Canopy.—Fig. 1.—The Canopy in Position.

Let A B C D be the front elevation of the canopy and E 6 2 the side elevation. A flange is added from 2 to 1, through which the canopy is fastened to the chimney or wall. For the pattern for the side extend the line 1 E in the side elevation, as shown by F G. Now divide the curve 2 6 in the side elevation into an equal number of parts, as shown by the small figures 1 to 6. Now place a stretchout of 1 6 on the line F G, as shown from 1 to 6. Through these small figures, at right angles to F G, draw lines, as shown, which intersect with lines drawn at right angles to 6 E from similar points in the side elevation. Trace a line through the points thus obtained. Then will 1 6 H be the pattern for the side.



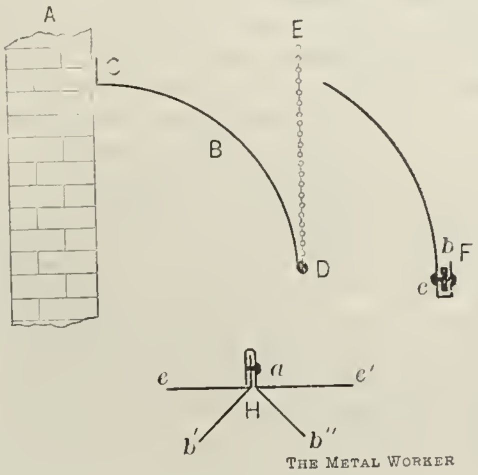
THE METAL WORKER

Fig. 2.—Front and Side Elevations and Patterns.

It will be noticed that no allowance has been made for wire, which must be added to the pattern, as the pattern is only developed to the under side of the wire, as shown by 6 in the side elevation.

The pattern for the front is obtained as follows, using the miter cut on the side pattern: First draw the line J I, equal in length to D C. Now, using the side pattern 1 H 6, place the bottom of the pattern H 6 upon the line J I, placing the corner H of the pattern upon the corner J, and mark the miter J K. Now reverse the side pattern, and in precisely the same manner obtain the miter cut I L. Then will K L I J be the pattern for the front. Laps must be allowed on the front and side patterns to allow flanges to be stretched, so as to obtain a standing seam on the corners, as shown by C in Fig. 1, or by b' a b'' in Fig. 3. It will be noticed that at a there is a single and a double edge through which rivets are placed at intervals, as shown.

A flange must also be allowed to the straight part 1 to 6 of the side pattern in Fig. 2, to allow a flange to be stretched so that the canopy can be fastened against the chimney D in Fig. 1. It is sometimes the case that the front of the canopy is of such length that a number of sheets are required. In that case straight sheets are placed between, by means of the standing seam e a e' in Fig. 3 and shown at B in Fig. 1, riveting the same as before mentioned.



THE METAL WORKER

Fig. 3.—Method of Construction.

Now assuming that the canopy has a wired edge, as shown by D in Fig. 3, it is fastened to the wall A by nailing through the flange C, the canopy B, if very long, being balanced by means of a neat brass or galvanized chain E, and fastened to the wire D and supported by the ceiling above E. Sometimes the wire edge is omitted, and a band iron is bolted or riveted to the lower edge, as shown at E in Fig. 1. The band iron is incased as shown by F in Fig. 3, in which b shows the band or flat iron, the metal c from the canopy being bent around the band iron, as shown, the rivet or bolt being indicated by c. Chains are also employed in this case to hold it in a plumb position.

C. D. Rounds, Central Square, Oswego County, N. Y., is distributing cards advertising Cadwallader's Genuine Old Style Roofing Plates, which he is prepared to furnish in any quantity. These Plates are stamped, resquared and heavily coated with pure refined new metals. Mr. Rounds also handles a number of other brands of Roofing Plates, made by the same concern, including the Saxon, Atlantic, Wonder Old Method, Wonder New Method, Cadwallader's Old Process, Optimist American, Cadwallader's Extra Coated, Cadwallader Old Style and C. W. C. Special brands, as well as both Coke and Charcoal Bright Plates.

A New Metal Roofing and Ceiling Catalogue.

The St. Paul Roofing, Cornice & Ornament Company, St. Paul, Minn., have issued a general catalogue for 1902, covering their productions in sheet metal roofing and siding, cornice and skylights, eave trough and conductor pipe, steel ceilings and interior sheet metal decorations and sheet metal supplies generally. The catalogue is 12 x 9 inches, printed on fine paper, and well illustrated. It is composed of 200 pages, divided into two sections, J and K. In the first section are given a variety of roofing specialties, including Kuehn's corrugated cut offs, galvanized wire conductor strainers. Never-Slip conductor hooks, corrugated hinged hooks, wire eave trough hangers, Imperial eave trough hangers, expanding elbows and shoes, galvanized eave trough and gutters, miters, slip joint end caps and drops, galvanized box and O. G. gutters, gravel roofing, ready roofing building papers, tarred felts, cement, nails, sheet copper, tin plates, valleys, stove pipe and galvanized and black sheets of all kinds, these supplies being extensively handled by the company. Following are presented a number of views of buildings in the Northwest as examples of the effect of sheet metal covering. These include stores, banks, elevators and factories. Rules for measuring buildings for the application of sheet metal are also given, together with diagrams, and other information intended for the use of the sheet metal worker in ordering material.

A variety of styles of sheet metal roofing and siding are shown, together with fire proof steel lath and corrugated iron awnings, with a variety of rock faced sidings, and the St. Paul metal shingles and metal tiles. A portion of the book is devoted to sheet metal ornaments in the line of cresting blocks, ornaments and finials, urns, crosses, conductor heads and galvanized iron finials and weather vanes in a number of attractive designs. Chimney tops and ventilators, skylights and cornices, window and door caps, galvanized steel tanks, smoke stacks, riveted steel pipe, tank heaters and the Giant feed cooker close the first section of the volume.

The second section, K, is devoted exclusively to steel ceilings, side walls, wainscoting and interior finish, a number of pages being occupied by interior views in buildings of various characters in which the company's goods have been used. A large and handsome assortment of steel ceilings, wainscoting, side walls, friezes, coves, center pieces and panel plates is followed by directions for the erection of these goods, and an alphabetical index of the contents of the volume.

FLASHINGS.

On Friday, June 13, a conference between representatives of the American Sheet Steel Company and the Amalgamated Association was held in Pittsburgh, when it was expected the wage scale governing sheet mills for the year ending June 30, 1903, would be adopted. No conference has yet been arranged by the Amalgamated Association with the American Tin Plate Company, but it will likely be held next week or the week after.

The Cornice, Skylight and Sheet Metal Ornament manufacturing business formerly carried on by Robert Jahn, Scotch Plains, N. J., will be continued by his sons, Philip Jahn & Brother.

E. E. Souther, president of the E. E. Souther Iron Company of St. Louis, Mo., sailed with his family on June 5 from New York for Santos, Brazil, from whence he will pay a visit to a married daughter at Sao Paulo, in the interior. Mr. Souther will be absent several months.

The Barrett Mfg. Company, Chicago, Ill., are sending out a leaflet calling attention to their high grade Building Papers, including Barrett's Diamond Red Rosin Sized Sheathing, a heavy weight three-ply Paper of 40 pounds, and Barrett's Challenge Rosin Sized Sheathing, a 30-pound three-ply Paper.

One of the largest contracts ever awarded for Metal Ceilings in New England has just been given to Rourke Bros. of New Haven, Conn. It consists of all the Metal Ceiling work for the new High School Building in that city, about 60,000 square feet. The Penn Metal Ceiling & Roofing Company's goods will be used.

The Nashville Roofing & Paving Company have been incorporated at Nashville with a capital of $50,000 to do a general roofing and paving business. George M. Ingram, William F. Leitwich, Robert L. Proctor and others are the incorporators.

The report that Follansbee Brothers Company, Tin Plate manufacturers, of Pittsburgh, had decided to locate their proposed new plant at Clarksburg, W. Va., is incorrect. They have been figuring for some time on the building of a plant to contain about four Sheet mills and the same number of Tin mills, but the exact location of the plant has not been determined. It will probably be built somewhere in the Pittsburgh district.

It is reported that the Republic Iron & Steel Company are negotiating for the purchase of the Russia mill of the American Sheet Steel Company at Niles, Ohio, which has been idle for several years. The plant contains two Sheet mills, a muck train and 23 puddling furnaces.

The Indianapolis Tin Company, Indianapolis, Ind., have been organized with a capital of $50,000 for the purpose of manufacturing and selling Tin Plate, Tin Cans and all kinds of Tinware. Following are the Board of Directors of the new company: Grafton Johnson, Edmund T. Shubrick and James B. Nelson.

Biersach & Niedermeyer, Milwaukee, Wis., manufacturers of Metallic Fire Proof Windows, have been incorporated under the name of the Biersach & Niedermeyer Company. The officers are: Louis D. Biersach, president; August Niedermeyer, vice-president and treasurer, and Paul L. Biersach, secretary.

A Government bill has been introduced into the Australian Parliament for the encouragement of manufactures in that country. Among the features of the bill is the provision for the payment of a bonus of 10 per cent. of the value of Galvanized Iron produced in Australia and of a similar amount on Iron and Steel Tubes or Pipes (except riveted or cast) not more than 6 inches in diameter. The sum of £50,000 is appropriated for the purpose, the bonus to expire on July 1, 1905.

The new plant of the Jackson Iron & Tin Plate Company, Clarksburg, W. Va., is reported to be about ready to start up in full. The mills have a daily capacity of 70 tons of finished product.

The large 52-inch Sheet mill at the new plant of the Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, was put in operation last week. This makes six Sheet mills in all now at work out of a total of 16 mills which the company expect to operate. Work on the erection of the other mills will be deferred until the Tube mills are completed, which will be in about a month's time.

Beseman & Bostwick, Hartford, Conn., have the contract for the metal work in connection with the changes in the entrance to the new Hartford Opera House. It includes a metal arch of elaborate design. They also have the contracts on St. Joseph's Parochial School at Bristol and a building for the Stanley Rule & Level Company at New Britain, Conn.

We have received from N. & G. Taylor Company, Philadelphia, a folder of neat get up, referring to their Taylor Old Style Roofing Plates. It contains a full description of the method by which these Plates are made and gives a number of details proving the superiority of this well-known brand of Roofing Plates. The company also send out a neat blotter in the interests of the same brand of Roofing Plates.

J. O. Perkins & Co., Chicago, dealers in Tinners' and Roofers' Supplies, have removed to 235 East Lake street, the expansion of their business necessitating larger quarters than afforded by their old quarters at 241 Lake street.

Don't be satisfied with "good enough" work. Get the reputation of doing first-class work, and then you may expect to hold the trade you build up.

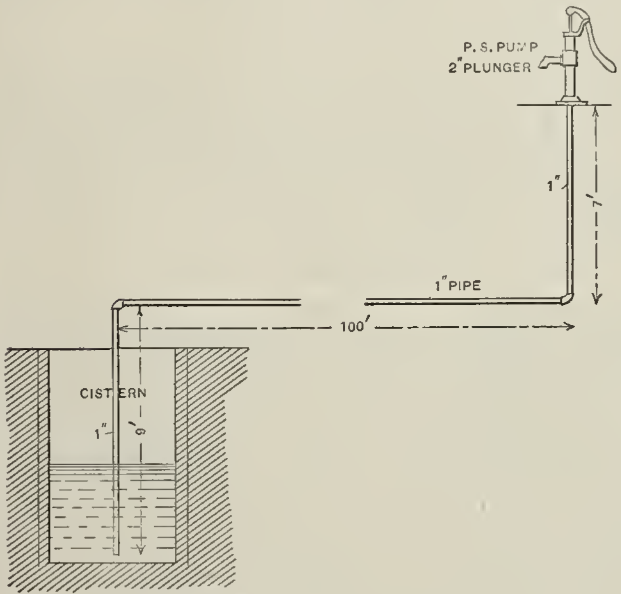
THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

SHOULD USE LARGER SUCTION PIPE.

From N. H. B., Bedard, Kan.—I am about to put in a pump job and I do not know whether it will work or not. The pipe is to be arranged as shown in the diagram. The pump is to be used to draw water from a cistern into a house located about 100 feet from it. The water will have to be raised 9 feet from the cistern, then carried over 100 feet and raised 7′ feet more to the house. I had intended to use 1-inch iron pipe for the suction, connecting it with a 2-inch pitcher spout pump. I should be glad to have some of the readers of *The Metal Worker* tell me whether this will work and what changes should be made in the piping, if any are necessary.



Should Use Larger Suction Pipe.

FINDING TRUE ANGLES IN ELBOWS.

From E. K., Philadelphia, Pa.—Will you please let me know through the columns of *The Metal Worker* how to obtain the true angles and miter lines for hot air pipes fitting around a cylinder, also the true angle for a branch from the main pipe, as shown on the sketch which I send herewith?

Answer.—To obtain the true angles for the various elbows and branches shown on our correspondent's sketch, we refer him to *The Metal Worker* of May 9, 1896, on page 40 of which is shown the method of obtaining the true angle in pipe We have no doubt this will answer our correspondent's inquiry, as the principles employed are similar in both cases.

WANTS TO HEAT A CONSERVATORY.

From Greenhouse, Paterson, N. J.—Having read the request for assistance by " G. J. T.," in *The Metal Worker* of June 7, I would recommend that he treat the conservatory as a greenhouse, figuring the radiation required in it on a greenhouse basis, and providing 1 square foot of surface in the radiator for every 4 or 5 square feet of glass exposed. On a basis of 1 square foot of surface to 4 feet of glass surface it will require 55 square feet of radiation, and this should be preferably arranged in the form of a pipe coil made of 1¼-inch pipes, supplied by means of a 1¼-inch pipe and having a 1-inch return pipe running to the heater, with an air valve on the return pipe at the heating coil. The coil should run along the outside wall near the floor.

PATTERN FOR TRANSITION PIECE.

From McG., Boston, Mass.—Will you please inform me through the columns of *The Metal Worker* how to obtain the pattern for a cylinder intersecting a square pitched base?

Answer.—On page 144 of " The New Metal Worker Pattern Book " (Problem 50) is shown how to develop the pattern for the base, while on page 127 (Problem 34) is shown how the cylinder is developed. We refer our correspondent to these problems, which will answer his question.

PAINT FOR ROOFING.

From W. E. J., Cincinnati, Ohio.—Please state in the next issue of *The Metal Worker* what is the best paint for painting tin roofing and valleys, giving reasons for the selection of the paint recommended. I should like to hear from different architects and roofers in regard to this matter.

Note.—We shall be glad if our readers will give their views on this subject. In the meantime, we would refer our correspondent to the many excellent roofing paints presented in our advertising columns. We have no doubt that the manufacturers of these paints can give substantial reasons for their use.

BACK NUMBERS WANTED.

From Edward Killan, 1426 South Lawrence street, Philadelphia, Pa.—Will one of the readers of *The Metal Worker* kindly sell me the copies of *The Metal Worker* of September 1 and 8, 1900, which contain the patterns for " Ship's Ventilator from Lateral Pieces " ?

TRADE NOTES.

The June blotter which the Dixon Crucible Company of Jersey City, N. J., are sending out in the interests of their Graphite productions is adorned with a floral design suitable to the season.

The New Freedom Wire Cloth Company, New Freedom, Pa., have within a short time made shipments of their Wire Cloth to 20 States and Territories. They have also made shipments to Cuba, Porto Rico and Honolulu, as well as to Scotland, British Columbia, Canada, Mexico, India and Australia.

The Staten Island Brass & Grey Iron Foundry Company, Richmond Borough, New York City, recently incorporated, have a fully equipped foundry for the manufacture of Castings of Brass, Gray Iron, Bronze, Aluminum, &c. It is the intention of the company to considerably enlarge the present buildings. The officers are Harry Wilkes, president; William H. Davidson, vice-president, and Thomas L. Fell, secretary and treasurer.

The Challenge Refrigerator Company, Grand Rapids, Mich., issue catalogues showing their lines of Victor, Triumph, Iceberg and Grand Refrigerators. The company advise us that they anticipate adding materially to their factory facilities the coming season, and that they will probably put in a line of White Enameled and Glass Lined Refrigerators.

John A. Walker, vice-president of the Jos. Dixon Crucible Company of Jersey City, N. J., sails for Europe on the " Kaiser Wilhelm der Grosse " on June 17. He expects to be gone about six weeks.

Maine Mfg. Company, Nashua, N. H., issue an attractive folder in which the merits of their White Mountain Refrigerators are set forth. They also manufacture the Maine Refrigerators.

The New Process Metal Rolling Machine Company, with principal office at 332 Harrison avenue, Harrison, N. J., have been incorporated with a capital stock of $125,000 by Warren C. Clouse, Wm. L. Jones, Neil Andrews, Harry L. Bennett, James L. Terhune, May Crane and John D. Crane.

The Vandergrift Mfg. Company of Jamestown, N. Y., are distributing an attractive folder illustrating and describing their new Vandergrift Rotary Washer and Pan-American Washer. These goods are handled by C. D. Rounds, manufacturers' agent, Central Square, Oswego County, N. Y.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is dull and has developed some weakness.

Copper is quiet and a shade weaker.

Pig Lead remains quiet and firm.

Spelter is still scarce for spot and prices firm.

Antimony is unchanged.

Nickel is in good demand and without change in price.

Aluminum is firm and in good demand.

Tin Plates are quiet, with prices unchanged.

Sheets are very firm in price and in good demand.

Old Metals are rather dull and weak.

Foundry Iron is very scarce, with prices extremely strong and high.

Sheet Copper is in good demand, with prices firm.

Sheet Zinc is without change.

Hardware is somewhat less active on approach of summer; prices rule firm.

Cast Iron Soil Pipe has been advanced 5 per cent. for the 4-inch medium size.

Plumbers' Supplies are dull, with prices strong and tending higher for Iron Goods.

Wire Nails are in better supply, with less demand; prices unchanged.

Cut Nails are in fair demand and prices without change.

Window Glass is dull, with no advance in prices.

White Lead has been moving in larger volume, with prices firm and slightly higher.

Spirits Turpentine is about 1c. a gallon higher.

Linseed Oil is in fair demand and prices unchanged.

METAL MARKET.

New York, June 13, 1902.

Pig Tin.—The market for Tin declined here on Thursday and closed with a decidedly weak tone. The downward movement was due to falling prices in London and recent heavy arrivals of Tin here. Jobbers' prices for Straits Pig in small lots are quoted at 31c. to 31½c. per lb. The business in this metal was of limited proportions, with a light demand and an almost entire absence of speculative transactions.

Charles S. Trench & Co., New York, publish the following American statistics of Pig Tin for June 1, 1902:

	Tons.
Estimated stocks on spot, New York, Philadelphia and Boston, May 1, 1902	2,019
Actual arrivals during May, New York, Philadelphia and Boston	2,972
Total	4,991
Estimated consumption during May	3,200
Estimated stocks on spot, New York, Philadelphia and Boston, June 1, 1902	1,791
Actual afloat from East Indies, shipments to June 1	2,821
Actual afloat from England, shipments to June 1	626
"Acara," ashore at Jones' Beach	90
Total visible supply, June 1	5,328

Copper.—The market for Copper has been dull and devoid of interesting features, and with an underlying weakness, although a somewhat improved feeling in spot Lake Ingot was manifested at the close. Wholesale prices receded slightly during the week. What business was done was almost wholly speculative, consumers buying scarcely anything. Copper in the London market has been gradually declining throughout the past few days. Jobbers quote Lake Ingot in small lots at 13c. to 13¼c. per lb. and Casting Copper at 12¾c. to 13c.

Sheet Copper.—The demand for Sheet Copper continues in good volume, and prices are firm and unchanged on the basis of 18c. per lb. from store.

Pig Lead.—No change is to be noted in this market. Quiet conditions prevail and prices are steady, the figures ruling for a long time past for small lots of American Pig being quoted at 4.45c. to 4½c. per lb.

Spelter.—The market for Spelter is rather quiet, with spot still scarce and relatively high in price. Jobbers are asking about 5¼c. to 5½c. per lb. for small lots of good Western brands. It is reported that the Western producers are showing some disposition to offer prompt shipments of the metal. The St. Louis market had developed a little weakness in the past few days.

Sheet Zinc.—The demand for Sheet Zinc is of the usual proportions, and prices are unchanged at 6¼c. per lb. for 600-lb. cask lots and 6¾c. to 7c. for smaller quantities.

Antimony—Is unchanged. Hallett's in small parcels is quoted at 8⅝c. to 8¾c. per lb.; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—There is no change in the market for this metal. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues active and prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market is absolutely bare of features of interest, the character of business in this department during the past week having been on the lines reported for some weeks past. Very little has been done in the way of large new business, that which is being put through being mainly of a retail character. Meanwhile mills are busy in making shipments on former contracts. Available stocks of Tin Plates in jobbers' hands are decidedly more liberal, but a few of the more popular sizes and brands of Plates are still in somewhat short supply. Jobbers' prices show no change. American Bessemer Coke Plates I C, 14 x 20, in moderate sized lots delivered at New York or corresponding points are quoted at about $4.75 to $4.90 per box.

Sheets.—A moderately active demand for Sheets still continues, but a good many of the larger buyers are covered and are out of the market for the time being. Some Sheet mills continue to have a good deal of trouble to get Steel, and now and then have to close down for lack of Bars. Prices are strong for Sheets for prompt shipment, but it is said that for very desirable orders for future shipment somewhat lower prices than those now current can be obtained from some independent mills. Galvanized Sheets are fairly active, but the demand runs heaviest for the heavier gauges of Black Sheets. Jobbers quote No. 27 one pass Cold Rolled Soft Steel Sheets at about 3.75c. to 3.80c., and No. 24 Galvanized at 4c. to 4.20c.

Chicago advices are as follows: A firmer tone has developed in the Sheet market, with a fair volume of business, premiums of $2 per ton being paid in a small way over the combination prices. No. 27 Black Sheets, Chicago, in small lots from store are quoted at 3.45c. to 3.55c. Galvanized Sheets are quoted at net prices, small lots from store ruling at 4.70c. to 4.75c. for No. 27.

Old Metals.—Demand is rather slack, and the market easier, especially on Scrap Copper and Brass, which are weak. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb.	10 c.
Light and Tinned Copper	per lb.	9 c.
Heavy Brass	per lb.	8 c.
Light Brass	per lb.	6½c.
Lead	per lb.	3⅝c.
Tea Lead	per lb.	3 c.
Zinc	per lb.	2⅞c.
Pure Aluminum Sheet	per lb.	22 c.
Cast Aluminum	per lb.	17 c.
No. 1 Pewter	per lb.	18 c.
No. 2 Pewter	per lb.	9 c.
Tin Plate Scrap, per gross ton		.... to $5.00
Wrought Iron Scrap, per gross ton		$13.00 to 13.50
Heavy Cast Scrap, per gross ton		12.00 to 12.50
Stove Plate Scrap, per gross ton		8.50 to 9.00
Burnt Iron, per gross ton		7.00 to 7.25

THE PIG IRON MARKET.

New York.—The market is quiet, but exceedingly firm, and a further upward tendency for prompt Iron. It appears that the great majority of founders have pretty thoroughly covered their requirements for the balance of the year. Quotations for summer delivery are as follows: Northern Iron, at tidewater, No. 1 X, $22.50 to $23; No. 2 X, $21.50 to $22; No. 2 Plain, $21 to $21.50. Tennessee and Alabama brands are quoted as follows: No. 1 Foundry, $21.75 to $22; No. 2 Foundry, $20 to $20.50; No. 3 Foundry, $19.25 to $19.75.

Chicago.—The principal feature of the Pig Iron market during the week has been the entrance of large buyers seeking to place contracts extending into the first six months of 1903. Stove works and general jobbing foundries have been among these buyers. The largest individual contracts, however, have been only from 5000 to 10,000 tons. Strikes at the furnaces and mines in Pennsylvania are responsible for the increased demand in Pig Iron in the West, Eastern buyers having been among the inquirers recently. For prompt delivery premiums of 50c. to $1 per ton are still obtained on both Southern and Northern Iron. Northern makes are particularly scarce. For deliveries extending into the first half of next year some furnaces are quoting 50c. per ton under the asking price for the last quarter of this year. Other makers have refused to offer any for sale. The volume of business during the week has been larger than for some time, the bulk of it being for last quarter delivery. We quote as follows:

Lake Superior Charcoal	$23.00 to $24.00
Local Coke Foundry, No. 1	22.50 to 23.00
Local Coke Foundry, No. 2	21.50 to 22.00
Local Coke Foundry, No. 3	21.00 to 21.50
Local Scotch, No. 1	22.00 to 23.00
Ohio Strong Softeners, No. 1	24.00 to 24.50
Southern Silvery, according to Silicon	21.15 to 21.65
Southern Coke, No. 1	21.65 to 22.15
Southern Coke, No. 2	21.15 to 21.65
Southern Coke, No. 3	21.15 to 21.65
Southern Coke, No. 1 Soft	21.65 to 22.15
Southern Coke, No. 2 Soft	21.15 to 21.65

Philadelphia.—The demand for Pig Iron is not large, as there are very few who are inclined to pay today's prices, unless their needs are imperative. There is still a wide discrepancy between supply and demand, which is covered in a measure by purchases of foreign material. The net result, however, is an increasing shortage. Purchasers of Pig Iron have to pay extremely high figures to get prompt shipments. Prices vary considerably when it comes to actual business, and $22 to $22.50 for No. 2 Foundry is about as good as can be done. Inquiries now coming in indicate the belief that high prices are likely to continue well into next year. Some sales have been made for deliveries in the first half of 1903 at prices equivalent to $20.50 to $21 for No. 2 X, and some at $21 to $21.50 for the last quarter of 1902. Prices for American Iron range about as follows for deliveries extending from October to April, earlier dates costing from $1 to $1.50 more money:

No. 1 X Foundry	$21.50 to $22.50
No. 2 X Foundry	20.50 to 21.50
No. 2 Plain	20.00 to 20.75

Pittsburgh.—The blast furnace strike in the two valleys is practically settled, and most of the idle furnaces have been started. There is not much Pig Iron for sale for delivery this year. Very little business is being done. No. 2 Foundry Iron is quoted at $21.50, Pittsburgh, for Northern brands. Southern Iron is being sold here at somewhat lower prices.

Cincinnati.—The situation in the Pig Iron market here is practically unchanged. There is but little standard Pig Iron, either Northern or Southern, selling, chiefly for the reason that there is little in sight to sell. A few sales of Foundry Iron up to 200 tons are reported on the basis of $17 to $17.50, Birmingham. The market is certainly very strong, and quoted at least 50c. higher than last week's figures. The strike in the Virginia coke regions is beginning to have some influence on the situation, and if it continues will have a distressing effect throughout this field. We quote f.o.b. Cincinnati as follows:

Southern Coke, No. 1	$20.25 to $21.00
Southern Coke, No. 2	19.75 to 20.25
Southern Coke, No. 3	19.25 to 19.75
Southern Coke, No. 4	18.75 to 19.25
Southern Coke, No. 1 Soft	20.25 to 21.00
Southern Coke, No. 2 Soft	19.75 to 20.25
Ohio Silvery, No. 1	22.85 to 23.35
Ohio Silvery, No. 2	22.35 to 22.85
Lake Superior Coke, No. 1	23.85 to 24.35
Lake Superior Coke, No. 2	23.35 to 23.85
Lake Superior Coke, No. 3	22.85 to 23.35

CHICAGO REPORT.

Scrap Iron and Steel.—There have been freer offerings of Stove Plate and prices have again declined. The general market for Scrap of all kinds also is somewhat easier, with a less active demand and a more ample supply. We quote dealers' prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	.... to 13.00
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	.... to 9.50
Burnt Iron and Grate Bars	8.00 to 9.00
Sheet Iron and Hoops	8.00 to 9.00
Plow Steel	12.00 to 13.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	8.50 to 9.00
Turnings	12.00 to 12.50
Horseshoes	14.00 to 14.50

Old Metals.—There is a perceptible decrease in the demand for Old Copper, Brass and Lead and the market is weaker in tone, with lower prices prevailing for various kinds. Consumers are giving preference to Ingot Copper at present prices. For Zinc, however, there is a good demand and stronger market, with prices fractionally higher:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	10 c.
Copper Clips	11 c.
Red Brass	11 c.
Yellow Brass	8¼c.
Red Brass Borings	10 c.
Yellow Brass Borings	7½c.
Light Brass	7 c.
Pipe Lead	3.70c.
Tea Lead	3.35c.
Zinc	3⅛c.
Tin Foil	22 c.
Pewter, No. 1	19 c.
Pewter, No. 2	11 c.
Aluminum	20 c.

Old Rubber.—The market is quiet and easier in tone, but prices are without essential change. Following prices are paid by dealers in this market:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7⅛ to 7¼c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6 c.
Black Rubber	....	4 c.
White Rubber	....	8½c.

Rags.—The offerings have been liberal and with little outlet the market has been easy. Dealers continue to buy, however, at 70c. to 75c. per 100 lbs., Chicago delivery.

Anthracite Coal.—A stronger tone is developing, in sympathy with the unfavorable outlook in the East. Little new business has been taken, but shipments have continued on old contracts. The prices current have remained unchanged, subject to a discount of 30c. per ton for shipment during this month:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

Phœnix Caster Company, Indianapolis, Ind., for whom John H. Graham & Co., 113 Chambers street, New York, are selling agents, issue a finely illustrated descriptive catalogue of their Antifriction Casters, which are made in great variety for numerous and diversified uses. New goods are illustrated on pages 24, 25, 28, 29, 33 and 40 for heavy trucks, tables, boxes, &c. On the inside of the back cover is a schedule of freight rates to 173 of the larger cities of the United States and Canada from their factory in Hamilton, Ohio.

The Gibson Iron Works, Gibson City, Ill., have built an addition to their works, consisting of a testing room and an office building with storeroom attached, for Fittings, which changes give them additional storage room of 50 per cent. over what they had formerly.

THE HARDWARE TRADE.

There is a perceptible diminution in the volume of orders which are being received by manufacturers, thus furnishing the usual prelude to the dullness which is expected to prevail during at least part of the summer. The number of lines in which heavy stock orders are being placed by the larger buyers is comparatively few, as the requirements for the fall have been already covered for many kinds of goods, while in others there is a feeling that nothing is to be lost by waiting a little. This, however, does not indictate any serious apprehension that the market will weaken. There are certain influences which tend to impart continued strength to it. Among these the difficulty in getting raw material and the high prices which prevail are the most important. Many foundries are inconvenienced by the scarcity of iron, and manufacturers have corresponding difficulty in producing goods into which castings enter. The coal strike has something of a disturbing influence and causes some disquietude. It is hoped, however, that the matter may be adjusted before its consequences become too serious. The movement of general business, so far as the supply of the needs of the smaller merchants is concerned, continues very satisfactory. Jobbers generally, while reporting some relaxing in the demand, regard the trade as in excellent condition, the local merchants doing a good business. Prices are in the main without material change. In some lines which have been in insufficient supply manufacturers are catching up with their orders and given an opportunity to accumulate something of a stock. It remains to be seen whether the cessation of the urgent demand for goods will have much influence in inducing the making of concessions in price. While the situation is regarded as justifying the hope of a large volume of business for some time to come, it is generally recognized that when there is a material falling off in the demand the market will be subjected to a trying test, and a substantial reduction in prices is to be looked for. Fortunately for the present, at least, the indications point to a continuance of prosperity, with a demand which will tax the facilities of manufacturers and should give a profitable business to merchants. If the promise of large crops is realized this will contribute greatly to this desirable result.

NOTES ON PRICES.

Plumbing Supplies.—In New York City and vicinity pronounced dullness has developed in the Plumbing Goods trade. This week is said by many of the local jobbing houses to have been the quietest they have experienced for a long time past. The falling off in the demand for Plumbers' Supplies is attributed mainly to the labor troubles and to the uncertainty regarding the business future, which has been aroused by the coal strike. The high cost of materials and of labor are said to have discouraged the prosecution of building operations in many quarters. Meanwhile, prices in all lines of Plumbers' and Steam Fitters' Supplies continue very strong, with a pronounced upward tendency in certain goods, especially those into the construction of which iron enters.

Cast Iron Soil Pipe and Fittings.—At a meeting of the manufacturers of Cast Iron Soil Pipe and Fittings, which was held in New York City on Thursday, June 5, an advance of 5 per cent. in the price for jobbers for 4-inch Medium Pipe took place. This style of Pipe is not much used in New York City or the adjacent territory. It is used almost exclusively in Philadelphia and the surrounding towns, and it is the trade in that section who will be effected by the change. There has been no change in the price of Medium Fittings, the previous discount being still in effect. The new prices on Medium Pipe are as follows:

4-inch Medium Pipe, S. Hub, per foot	19½c.
4-inch Medium Pipe, D. Hub, per foot	20½c.

Freight allowed on carload lots. Less than carload lots are f.o.b. foundry.

Sanitary Earthen Ware.—We are advised by the Trenton Potteries Company, Trenton, N. J., that the manufacturers of Sanitary Earthen Ware are not working upon a new price-list, as was reported a short time ago. They add that they do not anticipate making any new prices on these goods.

Summer Goods.—The urgent demand for the summer line of goods, such as Refrigerators, Freezers, Screen Doors and Windows, Wire Cloth, Poultry Netting and Lawn Mowers, has perceptibly diminished, and the manufacturers are beginning to catch up with their accumulated business. Nevertheless, there is still difficulty in some quarters in obtaining supplies of seasonable goods, and buyers are sometimes obliged to pay higher prices in order to obtain immediate shipment. Prices in all these lines continue firm.

Wire Nails.—The mills are now in a position to make more prompt shipments of Wire Nails than for some time. Many have caught up with their orders, and with the increase in demand are better able to meet the requirements of the trade. Some falling off in the demand for Wire Nails is reported in the New York market. Nevertheless, business is referred to as fair. Small lots from store are quoted at $2.30 per keg.

Cut Nails.—Cut Iron Nails are still more difficult to obtain than those made from Steel. The local demand continues in about the same proportions and at unchanged prices. Small lots of Cut Nails from store rule at $2.30 per keg.

Window Glass.—The demand for Glass has been very light and more or less shading of prices by jobbers is reported. Under these conditions no advance has been made in quotations by the Jobbers' Association. Single and double strength Glass from store is quoted at 89 per cent. discount.

White Lead.—The cooler weather during the past week has improved the demand for White Lead in Oil. Quotations are firm and slightly higher, small lots of White Lead in Oil from store being quoted at 6½ to 6¾ cents per pound.

Linseed Oil.—Prices on out of town Raw Oil were advanced during the week, but City Raw continues as before, selling in a retail way at 67 to 67½ cents per gallon, according to quantity. The jobbing demand is of fair proportions.

Spirits Turpentine.—The Southern market continues strong in tone, owing to the activity in export buying. Locally the market is about 1 cent higher, Turpentine in small lots being quoted at 50 to 50¼ cents per gallon. The demand is confined to small lots.

Dover Egg Beaters.—Dover Egg Beaters have been advanced in price. The family size now commands 50 cents a gross more, and the hotel size $1.50 above the prices recently ruling.

◆

The Cragin Combined Garbage Crematory & Water Heater Mfg. Company, Chicago, have issued a pamphlet illustrating their sanitary device for the combined purpose of burning garbage and heating water. The company claim that garbage can be incinerated without odor, water heated quickly with a minimum consumption of fuel and sanitation promoted by the use of the device, which has been approved by the Chicago Health and Building Department.

The National Steam Economizer Company, Springfield, Mass., have decided to remove their business to Norwich, Conn., where a well equipped factory will be established for the manufacture of the Keller devices and other appliances for which this concern have the patents.

An "ad." in a trade journal, says the *Construction Review*, will do what traveling men as a rule do not do. It will go to towns off from the railroad where there are no hotels. It will work nights, Sundays and holidays, in wet weather or dry, hot weather or cold. It will talk to a merchant before some of the boys are out of bed in the morning and after they have gone to bed at night. It's one of the few things that has not yet struck for eight hours.

AN ODE TO THE AVERAGE SALESMEN.

BY OLIVE MILNS.

When you want to take a drink,
Do you ever stop to think
That your footsteps better stray outside a bar;
That your quarters can't do worse
By remaining in your purse,
Than by spending them on "don't-know-where-you-are?"
Now, do you ever think?
Well; generally.

When you cultivate a wink,
Do you ever stop to think
That your ogles ought to keep right on one girl;
That your arms should ne'er embrace
Those that boldly go the pace,
When your heart's desire's outside the giddy whirl?
Now, do you ever think?
Well; generally.

When you're on the very brink,
Do you ever stop to think
That gambling, drink and women play the deuce;
That these tendencies don't pay
And your life is thrown away,
By absorbing all the dainties on the loose?
Do you ever turn a leaf?
Well; sometimes.

◆

The Production of Nickel in 1901.

In the report of the mineral resources of the United States in 1901, shortly to be issued, Dr. Joseph Hyde Pratt gives a report on the production of nickel last year, in which he says that the domestic product of nickel has been mainly as a by-product from the lead ore of the mines of La Motte, Mo., since the shutting down of the Gap nickel mines in Lancaster County, Pa., about ten years ago. Small amounts of nickel minerals have been found in North Carolina, but not in commercially sufficient quantities. Similar occurrences of nickel silicate are found in Oregon. Nickel ore is also reported to occur in some quantity near Keller, Wash. The Wyoming nickel ores near Sheridan in that State do not seem to contain nickel in commercial quantity. Nickel ore is found in small quantities in certain districts of Nevada, Arizona, South Dakota and Idaho, and a recent discovery of nickelferous ore is reported in Southeastern Alaska. None of these deposits have been as yet worked commercially.

Nearly all the nickel used in the United States is obtained from the mines in the Sudbury district of Canada, which produce about one-half of the nickel used in the world. The other chief sources are the mines of New Caledonia in the Pacific Ocean, and of Silesia, Austria. Nickel deposits are also being developed in Norway, and a supposed deposit of nickel has lately been discovered near the headquarters of the Tulameen River, British Columbia.

The first use of nickel was in making German silver. It is also extensively used for coinage by the United States and brought from European countries. In this country the metal is now being largely used for coating iron sheets for making culinary utensils and other objects and as a plating material. Its most important modern use, however, is in making nickel steel. Nickeloid, a nickel plating on zinc, which is noncorrosive and does not oxidize or rust, is now being largely used in the manufacture of bathtubs, refrigerator linings, &c.

The product of the nickel mines of the United States for 1901 amounted to 6700 pounds, valued at $3551. This is a decrease of 3015 pounds from the previous year's production. The amount of refined nickel imported and entered for consumption in the United States in 1901 was 117,364,337 pounds, valued at $1,847,166, as compared with 57,956,000 pounds, valued at $1,323,630, entered in 1900. The amount of nickel produced from matte and ore imported into the United States last year was 10,497,097 pounds, worth between $5,000,000 and $6,000,000. There was a decided increase in the importation of nickel ores from New Caledonia last year. The nickel industry is increasing rapidly, and there has been a pronounced growth in the amount of nickel used in the United States.

◆

The Enterprise Stove Company, Vincennes, Ind., whose plant was recently destroyed by fire, advise us that the press reports which stated that the directors of the company had decided to rebuild are not correct. They wish it fully understood that no decision as to whether they will or will not rebuild has yet been made by the company.

ARE YOU A BACK NUMBER?

You are if you use galvanized sheets. Be progressive and use Aluminum Coated Steel Sheets. The most durable coated sheet on the market. Can be soldered with common solder.

THE STEEL & IRON ALUMINUM COATING CO.,

CONNELLSVILLE, PA.

DON'T READ THIS THROUGH.

IT WILL SHOCK YOU.

Galvanized Iron is no good any more—no matter where you buy it or what you pay for it. The coating peels off and the pipe rusts through and rots before your customer pays his bill—and then where are you? Use **Aluminum Coated Steel,** no rust, no flaking, no trouble. Buy one bundle for a trial and you will never use anything else. It is as durable as copper and a great deal cheaper.

The Finishing Touch

to a building estimate is to specify M F Roofing Tin. It is the best roofing material—perhaps just a little more costly at first; but it will last more than half a century; will not rust, or leak. It is the world's standard for roofing tin.

M F Roofing Tin

is made by the old-style hand process. It carries the heaviest coating of pure tin and new lead. Every sheet is carefully inspected and only perfect plates sold. This (MF) mark stamped on every sheet. Ask your roofer, or

ABOUT MIXTURE OF STYLES.

Mixture of styles may do for a crazy quilt, but it isn't the thing for a Metal Ceiling. To look right, every part of the ceiling should be in harmony.

The style of decoration selected should be adhered to throughout whether it be Colonial or Moorish, Gothic or Renaissance, Empire, Rococo, or what not. Otherwise the result is bound to be a conglomeration.

Conglomerated Metal Ceilings are no longer a necessity.

BERGER'S "Classik" METAL CEILINGS (BERGER'S "Classik" TRADE MARK METAL CEILINGS)

have made it easy to secure complete artistic harmony.

Our method of classifying the designs saves time and guess work in making a selection. Get our catalogue and see for yourself—we mail it free upon application.

LITTLEFORD BROTHERS,
453-55-57 Pearl Street, CINCINNATI, O.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting
as applied to all branches
of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
  1. MITER CUTTING,
  2. FLARING WORK,
  3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

THE ELECTRIC CITY GUTTER FORMER

[New In Principle.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.

This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.

The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike. No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.

Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

CORNICE MAKERS' SQUARING SHEARS,
With Lever Arc, Automatic Gauge. Will cut No. 2 iron.
97 inches long.

HERCULES SHEARS

make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

One of the Davis Heaters.

A Transformation is Coming

THE war between the coal miners and coal mine owners is the golden opportunity for pushing petroleum and its products for domestic heating which owners of oil wells will not be slow to take advantage of.

The Davis Water Heaters present a broad sheet immediately above the fire over which all the water is constantly passing, thus keeping the sheet cool. Under this large sheet is a fine place to put a petroleum burner, changing the fuel for the heater from coal to oil, retaining its economical character.

Illustrated circular sent promptly on request.

WRITE FOR CATALOG.

ROBINSON FURNACE CO., Chicago.

Fall River, Mass., June 13, 1902.

Replying to your inquiry would say your No. 30 "DIGHTON" Furnace heated my house comfortably all last winter.

I was advised not to use Hot Air and had about decided it was impossible to heat my house with a hot air Furnace after trying two other Furnaces, one the same size, and one a size larger than your No. 30 "DIGHTON."

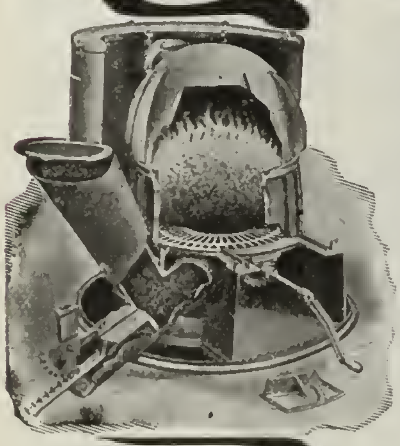
Yours respectfully,

The house referred to above is very large and exposed to severe winds.

The owner strongly favored Furnace heating but had about decided to have a hot water system installed when some one told him about the "DIGHTON" Furnace.

While our inquiry referred more particularly to the amount of fuel used, he evidently considered that of no great importance, and we have since learned that he did not care to take the trouble to look the matter up, as the quantity of fuel didn't matter providing his house was comfortably heated.

DIGHTON FURNACE CO., Taunton, Mass.



IF YOU ARE NOT SELLING THE

Peck=Williamson Underfeed Furnace

you have not the trade and are not making the money you might Just a pull or two of the lever feeds the new coal from underneath.

The Underfeed Furnace consumes less fuel than any other furnace ever built. The coal is burnt more slowly. All the heat units from it, as well as from the smoke, are utilized and all smoke eliminated.

Our handsome booklet explains its splendid heating qualities and coal saving.

You may have this booklet and our special plans for selling. Ask for booklet about our Laundry Dryer also.

Effects of the Coal Strike.

The coal strike has entered upon its seventh week, with little indication of an early settlement. While all strikes are, of course, detrimental to the general welfare, those of the coal miners are particularly injurious, as they affect the interests of so large a part of the population of this country throughout many States. We find at this time the strike of the anthracite coal miners interfering seriously not only with manufacturing industries in the eastern section of the country, but also with the comfort and convenience of the people at large. They are suffering from annoyances caused by the scarcity of anthracite coal, which are far greater than had been anticipated. The interference with manufactures has not been so great as it might have been, inasmuch as bituminous coal has been substituted as far as possible for anthracite and thus the works have been kept in operation, but the increased price of fuel naturally tends to reduce the profits of manufacturers. The scarcity of anthracite has caused several blast furnaces to be banked or blown out, and this brings considerable inconvenience to a section of the iron trade at a time when such a heavy demand for iron exists that any restriction of the supply is immediately felt. We are now, however, confronted with the possibility of a diminution in the supply of bituminous coal, caused by the extension of the miners' strike to the soft coal regions. This may prove a most serious matter, as both manufacturing and transportation interests may be greatly affected. It is to be hoped that the strike of the soft coal miners is not so extensive as indicated in some of the reports and that it will not spread to the more important mining districts of Western Pennsylvania.

Causes of Strikes.

The number and importance of the labor troubles now in progress prove most impressively the futility of all efforts by economical organizations or philanthropic individuals to bring about better relations between employers and workingmen. It seems inevitable that a conflict of interests resulting in a strike must develop at some time. In periods of depression strikes are caused by reductions in wages or by the enforcement of regulations designed to increase output or lower the cost of production. But in times like these they are caused by the aggressions of labor organizations, either seeking a greater share of the presumptive large profits or aiming at a reduction in the service to be rendered for the wages paid. But whatever may be the cause, no effective means has yet presented itself for a speedy settlement. Employers brook no outside interference, as they very properly claim that those not directly interested are not sufficiently qualified to judge fairly the merits of the issue involved. Workingmen, on the other hand, usually express themselves in favor of arbitration, as they know that arbitration in the great majority of cases means a compromise, thus giving them some advantage from which they can hope to attain further gains in the future. A most deplorable development of modern strikes in great industries is the complete breakdown of civil authority whenever employers attempt to continue their operations in defiance of their striking workmen. Few cities or communities can be found in this country in which the ordinary authorities are strong enough to protect life or to insure the liberty of an individual when a strike is in progress. Yet, in the words of Kipling, it seems that we must simply "muddle" along, hoping that something will happen to bring about a better state of affairs.

Steam Fitters and Boiler Manufacturers at Atlantic City.

The annual convention of the National Association of Master Steam and Hot Water Fitters at Atlantic City last week furnished this body with another able set of officers, and while its most important business was transacted in executive session, it was the general impression at the close of the deliberations that the convention had been productive of decided benefit to the members. The Committee on Grievances found occasion to meet, and some who were held to have offended by their methods of trading came before the committee, with the result that the points raised were fully explained. While the place for holding the next convention was left to the Executive Committee, a strong effort will undoubtedly be made to secure favorable action on the invitation from the railroad companies and other interests to hold the next convention in California. The convention was made the opportunity for the exhibition of many new and standard goods, and not a few good orders are reported as a result of the meeting. The boiler manufacturers, who held their meeting in Atlantic City at the same time, secured a good attendance. Many interesting matters were discussed by this body, but the most important action taken was to maintain unchanged the prices on boilers and radiators now prevailing. The advisability of printing in catalogues the ratings of boilers was a theme of conversation at the meeting, but any change in the old custom is regarded as improbable.

The Use of Oil as Fuel.

The existing coal strike has served to call the attention of the public to the fuel resources of the United States in the shape of oil. Much testimony has been brought forward recently in support of the claim that oil as fuel is cheaper than coal. The Southern Pacific Railroad Company, according to a dispatch from Beaumont, Texas, have issued a statement showing that during the month of May 39 of their locomotives burning oil for fuel traveled 100,000 miles on 12,000 barrels of fuel oil, at a cost of $3600. The cost of coal for this work is stated approximately at $20,000, indicating a saving to the railroad company by the use of oil fuel of about $16,000. A press dispatch from Baltimore this week reports that a number of leading manufacturers in that city are now using oil in place of coal to furnish heat for the boilers at their plants. These manufacturers allege that they find the oil less expensive than coal, while fully as effective and much cleaner, in that its use does away entirely with the black smoke, soot and dust which have always accompanied the use of coal. Similar testimony comes from other sources where oil has been substituted for coal for manufacturing purposes. Moreover, the exhaustive experiments in this field that are being conducted by the Bureau of Steam Engineering of the United States Navy are said to have brought out, in the most striking manner, the advantages of oil as a fuel in comparison with coal. In experiments with oil fuel which were conducted last week under the eye of Rear Admiral Melville, under a force draft pressure of 1 inch one-third more steam was produced than under corresponding conditions when the best quality of Pocahontas coal was used as fuel. Furthermore, the experiments are said to show that the combustion of oil fuel can be made so complete as to produce practically no smoke. This seems to offer a solution of both the smoke problem and the coal problem. Naturally, it will be a long time before oil would come into general use as fuel, because the change from coal involves costly changes in apparatus. At the same time, it is satisfactory to know that this country possesses a practically unlimited supply of an efficient substitute for coal. Should the present coal strike be greatly prolonged, there is no doubt that the use of oil as fuel will receive a great stimulus in this country.

Quantity versus Quality.

One of the secrets of American industrial success is the extraordinary ingenuity and skill in turning out great quantities of goods at a minimum of cost. To this end the genius of her inventors contributes, while for its attainment the investment of capital is on a liberal scale unthought of until recent years. In almost every branch of the metal trades it is necessary for the manufacturer, in order to score a commercial success, to give his attention to the production of goods in large quantities and by the most economical processes. In many lines the competition is so close and the margins of profits have been so narrowed that it is only by doing a heavy volume of business that he can obtain anything like an adequate return for his investment of capital and labor. This tendency toward the production of articles at the lowest possible cost is fostered also by the popular demand for goods at the lowest obtainable prices. In a great many lines it has for years been necessary to put on the market goods which sell at a very low price, too low a price, indeed, to be consistent with fair quality. Hence, manufacturers have often been driven to producing goods of low quality which serve a temporary purpose, but are in the long run quite unsatisfactory and more expensive to the user than if costing considerably more as of better material and workmanship. Under the stress of business exigencies some manufacturers doubtless find it their policy to turn out such goods in great quantities, making the matter of quality an entirely secondary consideration. Such manufacturers are to be regarded as filling a necessary place in the commercial organism, but their position is not nearly as desirable nor their business interests as well secured as if they were among the fortunate number who are permitted to make the quality of their products a leading consideration and carry on a profitable business in goods which are regarded as setting the standard of excellence for the trade.

Editorial Notes.

Plumbers' strikes in many parts of the country continue to be a disturbing feature which is seriously affecting the building industry and the various trades catering thereto. There has seldom been a time when so many strikes of this character were in operation as at the present. Many of these labor disputes have been carried along for several weeks with little indication of an early settlement. Some of the strikes have been adjusted in the past week or two, however, mainly by concessions granted by both sides. The effect of these labor troubles is very apparent in the demand for plumbing goods in the East. Jobbing houses report a decided falling off in the demand for this class of material, which they attribute almost wholly to the suspension of construction operations on account of strikes. Considering the high prices at which almost all plumbing materials are now selling, the demand for higher wages by the workmen, which will materially increase the cost of labor, will tend to so further enhance the cost of plumbing as to discourage projected building operations in some quarters.

One result of the anthracite coal strike which brings that unfortunate occurrence home very forcibly to the citizens of New York is the contamination of the usually pure air of the city by the smoke and soot of the soft coal which is being very generally used by large consumers. The atmosphere in New York City these days is becoming more like that of Pittsburgh or Chicago. The matter of the soft coal nuisance has been taken up by the city Board of Health with a view to its suppression; but so long as the anthracite coal strike continues and supplies of that kind of fuel are unobtainable it is difficult to see just what can be done to remedy the present trouble, unless it be by the more general use of smoke consuming devices, some types of which have proved efficient in other large soft coal burning centers. It would seem that New York will have to patiently bear the annoyance for a while, until the settlement of the present strike again permits an adequate supply of anthracite coal to be secured.

The American School of Correspondence.

Believing that the work of education in technical subjects by means of correspondence may be made efficient and helpful beyond what has hitherto been accomplished, the professors and instructors in engineering and the faculty of the Armour Institute of Technology, Chicago, will hereafter constitute the Board of Instruction, Revision and Examination for the American School of Correspondence of Boston, Mass. The aim of the management of the school is to make the work of correspondence co-ordinate with the work of the shops and laboratories. Therefore the work done at the School of Correspondence will be fully accepted and credited at the Armour Institute of Technology when students desire to complete their course by actual residence in Chicago. The instruction papers and methods of the American School of Correspondence have been examined by the members of the faculty of the Armour Institute and have been approved. Dr. Frank Gunsaulus, president of the Armour Institute, has become chairman of the Advisory Board of the school, and the faculty above mentioned will co-operate with him to conduct this educational enterprise by correspondence in the hope that earnest and aspiring students of all ages may be enabled to obtain the results of the latest and most complete laboratory work and experimentation in the Armour Institute of Technology. Full credit will be given there for work done according to this arrangement with the American School of Correspondence.

The American Society of Heating and Ventilating Engineers.

FIFTH SEMIANNUAL MEETING.

The fifth semiannual meeting was one of the most enjoyable and interesting that the American Society of Heating and Ventilating Engineers has ever held, although a previous semiannual meeting of the society was held in Atlantic City. The meeting was called to order at 10.45 a.m. on Monday, June 16, by President Alfred E. Kenrick, who announced that all interested in the exchange of experience on heating and ventilation were accorded the privilege of the floor. The secretary then called the roll, and the following members were found to be present during the meeting:

C. E. Oldacre,
J. A. Payne,
J. R. Shanklin,
Fred. D. Johnson,
A. S. Mappett,
A. B. Franklin,
A. P. Broomell,
John C. F. Trachsel,
Harry S. Martin,
J. J. Wilson,
H. Sullivan Alexander, Paris, France.
J. A. Crowley,
F. P. Edson,
D. M. Quay,
W. H. Switzer.

The meeting was also attended by a large number of guests from the other associations.

New Members.

The secretary then announced the election of the following new members:

Albert B. Franklin, Boston.
Frank Dobson, New York.
Wm. Cressy Vrooman, Schenectady, N. Y.
A. P. Broomell, York, Pa.
George M. Langdon, Hartford, Conn.
Clarence M. Lyman, Utica.
John C. F. Trachsel, Philadelphia.
C. E. Oldacre, Philadelphia.
John H. Lindsay, Brooklyn, N. Y.
Charles P. Vanderveer, New York.
Frank Paley Edson, Topeka, Kan.
Walter Yates Swinton, Manchester, England.
F. M. Mechling, Pittsburgh.

Associate Members.

Harry S. Martin, Dunkirk, N. Y.
Alfred E. Pfahler, New York.
John N. Bruce, New York.
T. Guy Haywood, Norwich, Conn.
Chauncey L. Williams, Chicago.
John A. Crowley, Chicago.
George A. Robertson, Brooklyn.

Discussion on Mr. Gormly's Paper.

The paper, entitled "A Time Limit and Dry Walls Necessary in Testing a Heating Plant," by John Gormly, presented in another column, was then read and discussed as follows:

Wiltsie F. Wolfe: Was the air changed during the test?

John Gormly: The building was open by reason of its incomplete condition, though the windows were covered with muslin.

C. B. J. Suyder: We have a number of fire proof buildings to test in New York this fall, and have prepared a form to include the various facts to be recorded.

W. Kent: The coal burned on different days of a test, cold or mild, should be recorded, as often the coal burning capacity necessary for success is impaired by inadequate chimney capacity.

A. P. Broomell: One of the difficulties experienced in making a test is to get the heating plant correctly attended to so as to carry an even pressure. With steam from street mains, where the steam can always be had, much less radiation will be required than where a boiler is used and left to the care of unskilled servants.

M. Sardou: One of the troubles is the duration of the tests. In my opinion, they should last for several days.

W. F. Wolfe: Air at 59 degrees will carry one-eightieth of its weight in water, and every 27 degrees increase in the temperature will double its moisture absorbing power.

M. Sardou: One of the difficulties in heating a building having wet plaster on the walls is due to the immense amount of water in the walls, which absorbs the heat faster than it is generated, and to the extent that it is impossible to raise a pressure on the boiler.

John C. F. Trachsel: The failure to raise pressure is due to the work having to be done over and over again. The water is evaporated and deposited on the glaass in the form of ice and the process is continually repeated.

M. Sardou: The time of test should be extended. I consider the time limit of 144 hours for test for fan systems in Baltimore schools too short.

H. Addams: I consider that cold walls have more influence than wet walls.

W. Kent: There is a great difference in the capacity required to heat a cold building to a given temperature and the capacity required to maintain that temperature after it has been reached.

W. F. Wolfe: The paper will be valuable for the information of customers who may demand a test under certainly difficult conditions.

Tenth Anniversary Meeting Discussed.

The topic, "The Tenth Anniversary Meeting in 1904: Suggestions for Making it a Notable Occasion," was then taken up. The discussion was opened by Frank K. Chew, chairman of the special committee, who invited suggestions for the assistance of the committee.

Andrew Harvey of the committee suggested that the opportunity for advancing the prestige of the society should not be lost, and W. F. Wolfe explained the interest taken in the society and the high place accorded it in the opinion of foreign engineers.

W. Kent suggested that the summer meeting of 1904 be held in St. Louis, relating the benefit to be derived by an engineering meeting at the World's Fair.

Frank K. Chew then spoke on the subject as follows:

The committee will be glad to receive your suggestions. That of Mr. Harvey is a good one, that one of the papers to be prepared for the 1904 meeting be a history of what the society has done in the past ten years. I have made a note of that, and intend to ask Stewart A. Jellett, than whom no one knows more clearly the objects of this society and what it has accomplished, to prepare such a paper. Some of our members here may not know the extent to which the published proceedings of our society are referred to in the different colleges in which engineering is taught, or the number of libraries where scientific works are gathered, on whose shelves our proceedings are to be found. So that a paper along these lines would surely be an interesting one to present at the meeting in 1904. It has been suggested that these and other papers be prepared in advance, not late like the papers that have come here in galley proofs. They should be received six months in advance, so that they can be sent to the members and digested. Delay in sending out the papers is one of the troubles that this society has always experienced, and which has tended to reduce its membership. I am satisfied that our membership would be much larger and that much more interest would be taken in the meetings if the papers were received in time to be printed and sent to the members before the meetings.

Now, to come to the suggestions that the committee have received: Mr. Seward of New York is the only member of the committee I have had a talk with, although Messrs. Stangland and Barron are in New York also. Mr. Seward says that the opportunity for advertising the society should not be lost. The society has already risen to a place where it ought to be brought to the attention of men who will take a deep interest in its work when they know about it, and the tenth anniversary will afford an excellent opportunity to bring it to the attention of those men. Mr. Seward's idea is—to make it specific—to get up a four-page letter sheet. The first page would have at the top. "The American Society of Heating and Ventilating Engineers." and then, in big type, "Tenth Anniversary Meeting, 1904." and if we decide that it is advisable to have the summer meet-

Summer Meeting of the American Society of Heating and Ventilating Engineers, at Atlantic City, N. J., June 16, 1902.

ing in St. Louis, it would be well to put that on also. This first page is blank for correspondence. Then we turn over to the next page, and with "The American Society of Heating and Ventilating Engineers" at the top, explain its objects, aims and what it has accomplished. Here would be given to a man who knew there was such a society, but who possessed little information as to its scope and character, a good deal of information about the society. Enough room would be left to print the names of the entire membership, and I think some of the lesser lights, like myself, would not be envious if we put down some of the achievements of our more prominent members. This letter head should be sent to every member of the society. Every member knows some man who ought to be a member. We are not so much after the man who is a graduate of some college, or who has done some big work. If he is an ambitious young man of the right sort and character, he will do. We do not want a man who is in the habit of painting the town red. We will wait until he settles down. So that when this stationery is received by the members they will be sufficiently discreet to correspond upon it with the right people. This is Mr. Seward's idea, if I understand it rightly. If the 200 members of our society use stationery of that character it will certainly bring it prominently before a great many men who are not now members, and who will see that it is a society worthy of their support by membership.

My ideas have been on an entirely different line, and there are two of them. The first is suggested by the fact that the Master Steam Fitters' Association has gained very substantial prestige from the circulation of the "Standard Flange Schedule." A few years have elapsed since that was put out, and now the frequent use of high pressure has made the "Standard Flange Schedule" subject to change and improvement. I want to preface one of my ideas with these facts, so that the idea that I want to present will not be subjected to the criticism that we are not setting up any standards because they will not be perfect. We do not care if they are not perfect at the start. We shall be glad to improve. The society can give to an immense number of people a little handbook for this meeting of 1904 saying the Committee on Standards has advised the following suggestions for a two-pipe steam system. The size of the main could be determined for a certain amount of radiation by this formula. Then give a little table. Turn over to hot water and do the same thing; and, as the hot air furnacemen are coming to the front in this society, I think a page should be devoted to hot air furnaces. I think we can depend upon Mr. Oldacre and Mr. Switzer to fill out that page. Now, a small handbook on the society given out at that particular January meeting and then circulated broadcast, notwithstanding that manufacturers put in the back of their catalogues that a 1-inch pipe ought to have a given size of return pipe to be effective, would do a great good, and such a handbook would prove one way of advertising our society.

We ought to have at the 1904 meeting papers on work that has never come up in our society. The ventilation of ships of all sorts is interesting to a limited number of people. Consequently it belongs in the 1904 meeting. Transports have carried no end of soldiers to Manila, and their heating and ventilating systems have not been described. There were special ventilating systems in these transports. I have talked with a member who says he has sold to the Government apparatus of various character, and I gather from his talk that there is something rather unique in the method of heating those transports. The committee will be grateful if he will find some way to prepare a paper along those lines. I want to see special papers of unusual interest presented. I do not care whether the paper is on a fan system, or a vacuum system, or some simpler system, so long as it is of unusual interest.

This is the line on which my mind has run for making that meeting a success, and you can see that there is a lot of work in it for somebody. I have not as much time to give to it as it may need. Consequently, the members of the society must lend their assistance promptly, or possibly the effort will fall flat and we will have a failure, not due to lack of interest on the part of the committee, but to lack of material, which can only be furnished by the members.

The secretary reported that the published proceedings of the society would as a result of a better condition of the treasury be issued to the members up to date, which statement was greeted with applause.

W. H. Switzer: I think one of the greatest attractions of the society is the fact that is on a sound financial basis.

W. M. Mackay: One of the drawbacks to the interest in the society and its meetings is the lateness that the papers prepared by the members reach the secretary for publication.

On motion the meeting then adjourned to meet at 8 o'clock.

EVENING SESSION.

The meeting was called to order at 8.30 p.m. by President Kenrick. The secretary read a telegram from Prof. R. C. Carpenter, stating that it was impossible for him to be present. Letters were read from Professor Hutton acknowledging the receipt of an invitation to the officers of the American Society of Mechanical Engineers and from A. M. Waitt, superintendent of motive power and rolling stock of the New York Central & Hudson River Railroad, regretting his inability to accept the society's invitation.

Discussions.

A paper by John J. Harris on "Cooling an Auditorium by the Use of Ice," presented in another column, was read and discussed. After discussion the secretary was requested to correspond with Mr. Harris and ask for further data to fill out what proved to be a very interesting paper.

Under the head of "Topical Discussion" a number of subjects were brought up. Among them was the disagreeable results that may follow a guarantee to heat to a given temperature at zero weather.

Further suggestions were given in reference to the tenth anniversary meeting, the most important of which was that the members should volunteer to inform the secretary or the committee that they would prepare papers on subjects familiar to them and lend their assistance generally. The committee were requested to prepare a list of subjects and distribute it among the members so that they might reply upon which they would prepare a paper, although papers on any subject with which members have experience would be welcomed.

After discussion the Board of Governors were requested to prepare a petition to be presented to the Advisory Committee on Engineering of the Carnegie Institute, setting forth the importance of establishing at the national capital a laboratory for experimental engineering, to be devoted to the testing of engineering appliances and for original research, and that one branch of such laboratory be devoted to the development of heating, cooling and ventilating.

At the close of the discussions, what was generally considered to be a very interesting meeting was finally adjourned.

"HEAT UNITS."

President Alfred E. Kenrick of the American Society of Heating and Ventilating Engineers has now received the highest honors that can be given by the National Association of Master Steam and Hot Water Fitters in his election as president of that body.

* * *

Henry L. Hall, another member of the society, is the steam fitters' new vice-president.

* * *

John J. Harris' paper on cooling buildings attracted the attention of many of the people visiting Atlantic City.

* * *

The tenth anniversary meeting in 1904 was the topic of conversation among many interested in making it a success. It is regarded as a fine opportunity for lifting the society well beyond any need for petty economies by bringing into its membership those engineers who should lend their assistance to the excellent work it is doing.

* * *

H. Sullivan Alexander of Paris, France, who is a large handler of boilers made in the United States, took great pleasure in meeting so many American heating engineers and listened attentively to the reading of the papers and their discussion.

* * *

A goodly number of applications are now in the hands of the secretary, some for full membership and some for associate membership, the latter being open to those identified with this branch of industry and who desire to give the society their support.

* * *

Twenty new members since the last meeting is good evidence of the impression the society's work is making on the profession.

* * *

John Gormly's paper on the conditions necessary to a fair test of a heating apparatus gave light on a subject that has had the serious consideration of the society for two years.

* * *

Regrets were freely expressed that the exigencies of business compelled ex-President Stewart A. Jellett to forego the pleasure of staying over to attend the meeting.

* * *

Prof. W. Kent came from Pittsburgh, arriving on Saturday evening, to visit the members and to attend the meeting.

* * *

Ex-President Wiltsie F. Wolfe, who is soon to make another trip abroad, nobly aided in making the meeting a success.

* * *

Andrew Harvey brought his family as far as Ithaca, N. Y., where one of his sons graduated as a mechanical engineer this year.

* * *

Lansing Taylor Carpenter is a six-year-old engineer, who came to the meeting with his father, B. H. Arnold Carpenter, but neither the Hotel Rudolf nor the board walk had the attractions for him that the sand and surf possessed.

* * *

The Buffalo Forge Company of Buffalo, N. Y., were represented by J. I. Lyle, M.E., manager of their New York house, and Wesley Bartine, M.E., manager of their Philadelphia house, who contributed not a little to the interest of the meeting by their information about the practical use of fans.

* * *

K. Duff of the Johnson Regulator Company's New York office attended the meeting and explained to many listeners the Johnson system of regulation.

* * *

Mrs. George C. Blackmore, Mrs. Homer Addams, Mrs. W. M. Mackay and Miss Jessie Mackay went on a sailing party accompanied by W. M. Mackay, W. F. Wolfe, Geo. C. Blackmore, J. J. Blackmore, H. A. Smith and Homer Addams.

* * *

Prof. Wm. Kent smashed the punching machine at the Inlet to the tune of 575 pounds. He formerly taught the boys some important lessons and had the force to make an impression on his scholars.

* * *

The engineers and steam fitters were alike impressed by the dip paint for fittings and for painting iron pipe shown by Fred. J. Shaler of the Wisconsin Graphite Company of Pittsburgh, Pa. Many orders were placed for this paint and also for the company's pipe joint cement.

* * *

Clarence S. Stokes, 240 West Somerset street, Philadelphia, represented the Norristown Covering Company of Norristown, Pa., manufacturers of pipe and boiler coverings.

* * *

E. Payson Trumbull, representing L. C. Howell & Co., 2013 Columbia avenue, Philadelphia, was an attentive listener at the meeting.

* * *

At the close of the morning session President Kenrick announced that the members were invited to Parlor G, where the hospitality of Jenkins Bros. of New York was dispensed with a large ladle by C. F. Webber, assisted by W. G. Le Compte and S. Le Compte. Charlie is strong on cordiality, and all were impressed with the good cheer of his greeting.

The Fowler & Wolfe Mfg. Company, Bourse Building, Philadelphia, presented the members with a celluloid vest pocket 1-foot rule graduated in inches and centimeters. On one side is shown one of the company's wall radiators.

* * *

J. J. MacDonald, 901 Maritime Building, New York, representing the Automatic Heating Company, was one of the interested guests at the meeting.

* * *

C. B. J. Snyder of the Board of Governors and architect of the Board of Education of New York came down Saturday afternoon and thoroughly enjoyed the rest and the entertainment afforded by the discussions at the meeting.

The American Foundrymen's Association.

The seventh annual convention of the American Foundrymen's Association was held this week in Boston, Mass., the sessions taking place in Huntington Hall of the Massachusetts Institute of Technology. An excellent representation of the membership was in attendance, as well as a considerable number of persons connected in various capacities with the foundry trade. Owing to the death of the president of the association, J. G. Sadlier of Springfield, Ohio, the vice-president for New York and New Jersey, Walter F. Prince of Elizabethport, N. J., acted as chairman. The report of the secretary, Dr. Richard Moldenke, showed a prosperous year in the foundry trade; the difficulties encountered lay in getting materials rather than orders, all foundries abreast of the times making money. The report of the treasurer, Thomas D. West of Sharpsville, Pa., showed a satisfactory financial condition.

A number of interesting papers were read and discussed, and the various committees appointed at the last annual meeting made their reports. The committee on the foundry trade school, consisting of Messrs. West, Putnam and Moldenke, reported that no action had been taken, but urged the necessity of such an institution and the desirability of a decision by the association whether the work of establishing one should be conducted under their auspices or be left to outside effort. Ex-President J. S. Seaman of Pittsburgh stated that the Carnegie Institute in that city will undoubtedly have a foundry department, and suggested that it would probably meet this want. A. W. Slocum of Pittsburgh moved that the committee be discharged with thanks and that another committee be appointed to co-operate with the Pittsburgh Foundrymen's Association in conferring with the management of the Carnegie Institute in the endeavor to secure the establishment of a department to give instruction in foundry practice. The motion was adopted.

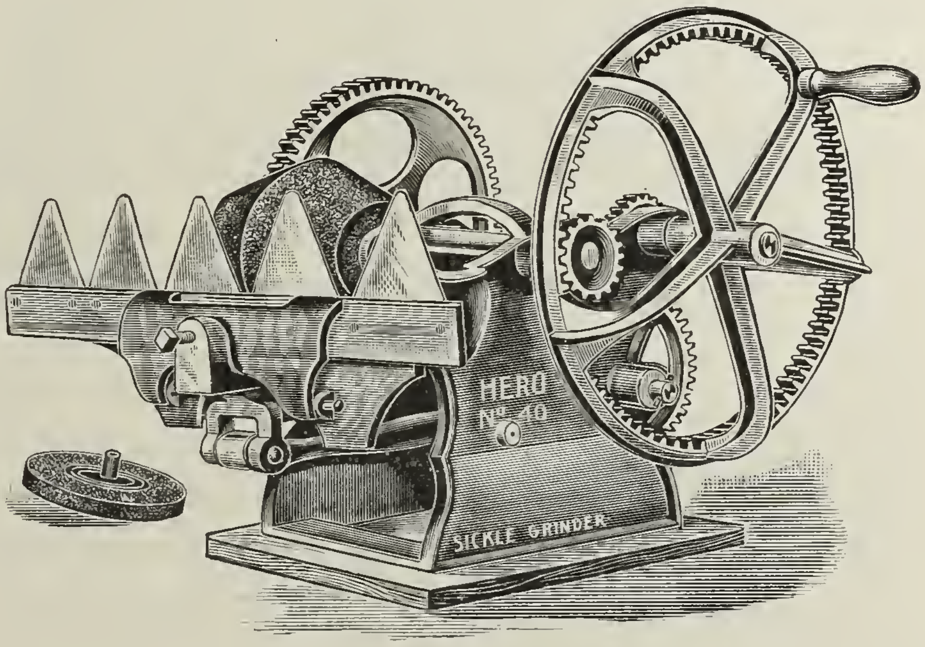
Production of Aluminum in 1901.

A bulletin just issued by the Geological Survey at Washington, D. C., contains the following paragraph concerning aluminum: The production of aluminum in the United States during 1901 amounted to 7,150,000 pounds. The Pittsburgh Reduction Company, operating the Hall patents, remain still the sole producer of aluminum in this country. The price of aluminum a pound remained practically stationary throughout the year, although the demand for the metal increased. The total imports of all forms of aluminum in 1901 were valued at $109,748, as compared with $50,444 in 1900.

In a recent examination of the fabric of St. Paul's Cathedral, London, it was found that under the coping of the balustrade surrounding the stone gallery at the base of the dome was a black deposit resembling boiler scale, about ¾ inch in thickness. This deposit has been subjected to a chemical analysis which revealed the curious fact that it is sulphate of lime, or gypsum. The chemical authorities believe that it was deposited by the atmosphere, and that in the past 200 years the smoke and gases from London chimneys have charged the rains with sufficient sulphurous and sulphuric acids to make this deposit.

Hero Section Knife and Tool Grinder No. 40.

The Robertson Mfg. Company, Buffalo, N. Y., are offering the section knife and tool grinder shown herewith. The knife holder is mounted on an oscillating arm having a reciprocating motion. The holder is hinged on the end of the arm, and has a suitable clamp screw with a handle for controlling the pressure of the knife to the wheel. It is also provided with a stop device at any point of contact, so that in case the knife has been broken at any place it may be ground out, thus avoiding grinding down the entire surface of the edge to sharpen the broken part. The motion of the arm can also be changed instantly from a stationary to a full stroke, or *vice versa*. The machine is provided with a screw adjustment to prevent the points of knives being ground off, allowing only sufficient contact with the abrasive to insure perfect grinding. The emery wheels furnished with machine are referred to as being made of the best Turkish emery of the standard pattern. The machine is supplied with one extra wheel, 6 x ¾ inch, and a special arbor for tool grinding. Saw gumming and sharpening wheels can be mounted on this arbor. The speed of the machine is stated to be 3000 to 5000 revolutions with ease; and the weight complete 21½ pounds. All parts, it is explained, are made of the best iron and steel. The point is made that farmers may take the grinder to the field for use in case of accident to section knives.



Hero Section Knife and Tool Grinder No. 40.

◆

Pound-Kilo Reference Table.

The continually increasing need of manufacturers and others of a comparative table giving the equivalents in kilograms (metric system) of pounds avoirdupois in the preparation of orders for export shipment, has led Charles B. Corwin, 15-25 Whitehall street, New York, manufacturers' export representative, to issue such a schedule gratuitously to any who choose to ask for it. The schedule is printed on a sheet of linen paper, 9½ x 8½ inches, of sufficient size to allow using large, well spaced figures which can be easily read. It will be remembered that with few exceptions the majority of foreign countries are using the metric system and in most orders for export the weight in kilos is obligatory. This sheet is designed for ready reference by shipping clerks and others having use for it, and being printed on but one side can be pasted on a board to hang if used in a packing room. Mr. Corwin refers to the table as undoubtedly correct, having been verified many times. We give below the principal part of the table, omitting the sixth double column, which gives the kilo equivalents of 200 to 20,000 pounds inclusive:

Pounds and Kilograms.—Comparative Table.

Lbs.	Kilos.	Lbs.	Kilos.	Lbs.	Kilos.	Lbs.	Kilos.	Lbs.	Kilos.
1	0.452	21	9.50	41	18.55	61	27.59	81	36.64
2	0.905	22	9.95	42	19.00	62	28.04	82	37.09
3	1.357	23	10.40	43	19.46	63	28.50	83	37.54
4	1.809	24	10.86	44	19.91	64	28.95	84	38.00
5	2.262	25	11.31	45	20.36	65	29.41	85	38.45
6	2.715	26	11.76	46	20.81	66	29.86	86	38.90
7	3.167	27	12.22	47	21.26	67	30.31	87	39.35
8	3.618	28	12.67	48	21.72	68	30.76	88	39.80
9	4.072	29	13.12	49	22.17	69	31.22	89	40.26
10	4.525	30	13.57	50	22.62	70	31.67	90	40.71
11	4.977	31	14.03	51	23.07	71	32.12	91	41.16
12	5.430	32	14.48	52	23.52	72	32.67	92	41.61
13	5.882	33	14.93	53	23.98	73	33.02	93	42.06
14	6.334	34	15.38	54	24.43	74	33.48	94	42.52
15	6.787	35	15.84	55	24.88	75	33.93	95	42.97
16	7.239	36	16.29	56	25.33	76	34.38	96	43.42
17	7.694	37	16.74	57	25.78	77	34.83	97	43.87
18	8.143	38	17.19	58	26.24	78	35.28	98	44.32
19	8.595	39	17.65	59	26.69	79	35.74	99	44.78
20	9.050	40	18.10	60	27.15	80	36.20	100	45.25

1 kilogram equals 2 1-5 pounds.

Do not put fractions of kilos on invoices or on packages; that is, discard a fraction of a kilo which is less than half a kilo, and regard a fraction greater than half a kilo as a whole kilo. Thus, 42.43 equals 42 kilos, and 42.63 equals 43 kilos.

◆

A New Mica Company.

A charter of incorporation has been granted by the Secretary of State of Ohio to the International Mica Mfg. Company of Columbus, organized with a capital stock of $500,000. The officers of the company are: President, E. J. Miller; vice-president, W. A. Ross; secretary and treasurer, A. B. Dawson; counsel, E. C. Hecox, and superintendent, Charles E. Ross. The company have been formed for the purpose of manufacturing different articles from mica. Their raw material will be provided principally by the Black Hills Mining Company, on whose property a large find of mica has been made recently. Among the goods which the new company will manufacture are mica for electrical purposes, stoves, lamp chimneys, fire proof paints, lubricants, insulators, &c. They will also furnish mica for use in the manufacture of wall paper, diaphragms for transmitters and receivers, and lining cable boxes, as well as refrigerator linings.

◆

The fire loss of the United States and Canada in the month of May, as compiled from the records of the New York *Journal of Commerce*, shows a total of $14,866,000, as compared with $13,894,000 in the preceding month and $22,380,000 in May, 1901, which last sum was swollen by the Jacksonville conflagration. The total fire loss for the five months ended May 31 is placed at $76,860,500, which is about $2,500,000 less than in the corresponding period of 1901 and $5,000,000 less than 1900.

A TIME LIMIT AND DRY WALLS NECESSARY IN TESTING A HEATING PLANT.*

BY JOHN GORMLY.

The writer had an opportunity to make partial heating tests in a new building during the past winter. While the tests are incomplete, our society is here given the benefit of the data obtained, because they appear to have a direct bearing on our proposed heating code in its practical application.

The building tested is a three-story and basement dwelling. The basement is not heated other than by the heat escaping from the uncovered heater and the main pipes. The first, second and third floors are heated by low pressure direct steam radiators; in all rooms the style of radiator is wall pattern.

The first floor and basement are of stone, the second floor is wood shingled, the third floor and roof are slate. The building is furred on the first floor and lined with building paper under the shingles. The house stands on an open lot exposed to winds from all directions. At the time of making the tests the building was without fire for two weeks. During that interval the temperature was for a good portion of the time as low as 20 degrees Fahrenheit.

When the plant was installed, before the walls were plastered, while window and door frames were so loosely fitted into the walls that the hand and arm could readily be passed out through holes between the frames and the wall, 10 pounds of steam were raised on the entire plant in a steaming test, although no window sash were in position; but the window openings were covered with thin muslin to prevent too great an escape of heat. The plant was able to raise more than 10 pounds of steam on the gauge; but as the safety valve was set at 10 pounds, that was the limit of steam pressure raised on a firing test. At this time the outside temperature was about 20 degrees above zero.

As soon as wet plaster was placed on the walls no pressure whatever could be raised to show on the gauge, although the plant was fired as hard as possible; the draft was excellent; anthracite coal, pea size, was used; all pipes and radiators were hot to the touch. The wet walls and saturated air appeared to absorb the heat as a sponge absorbs water. Although all holes around window frames were now closed by the plaster and the building was comparatively tight, we could not show 1 pound of steam on the plant, which showed 10 pounds readily while the building was so very open. The situation was not perceptibly altered after window sash were fitted to the window openings, which up to this time were covered with muslin. The window glass quickly was covered with ice, as the moisture evaporated from the wet plaster froze to the surface of the glass. The plant was run in this condition for several weeks to dry the plaster. After the white finishing coat of plaster was put on and partly dried, but still damp enough to be readily indented by the finger, the building was left for two weeks without fire. We thus had an opportunity to make some temperature tests. Our tests continued for a portion of two days. The result of our tests is appended.

Attention is called to the improvement in pressure and also in temperature, as shown by the second day's test, over the tests of the first day. We will take the readings at 9.30 on each day. The outside thermometer shows an increase of 8 degrees on the second floor, while in the parlor we show an increase of 26 degrees, in the first floor entry 28 degrees, third floor front 30 degrees, and in all rooms we show an increase over the first day's record. A comparison of the first and second days' readings would appear to be conclusive evidence that some time limit should be set in the use of our proposed testing code.

Also a note should accompany the code, stating that the walls of a building must be reasonably dry to get any fair estimate of the power of a heating plant. It is to be regretted that the party making the test neglected to keep a record of outside and inside temperatures for a longer time on the first day; but as he was not seeking comparative tests and was intent only on finding the highest temperatures he could obtain in the various rooms, he devoted the first day to warming the walls up preparatory to a test to be made the second day.

The horizontal line from 12 to 2 o'clock on the second day's test, the result of cleaning and recoaling the fire, is apparent. The same effect is shown in the first day's test from 11.30 to 12 o'clock. The relatively

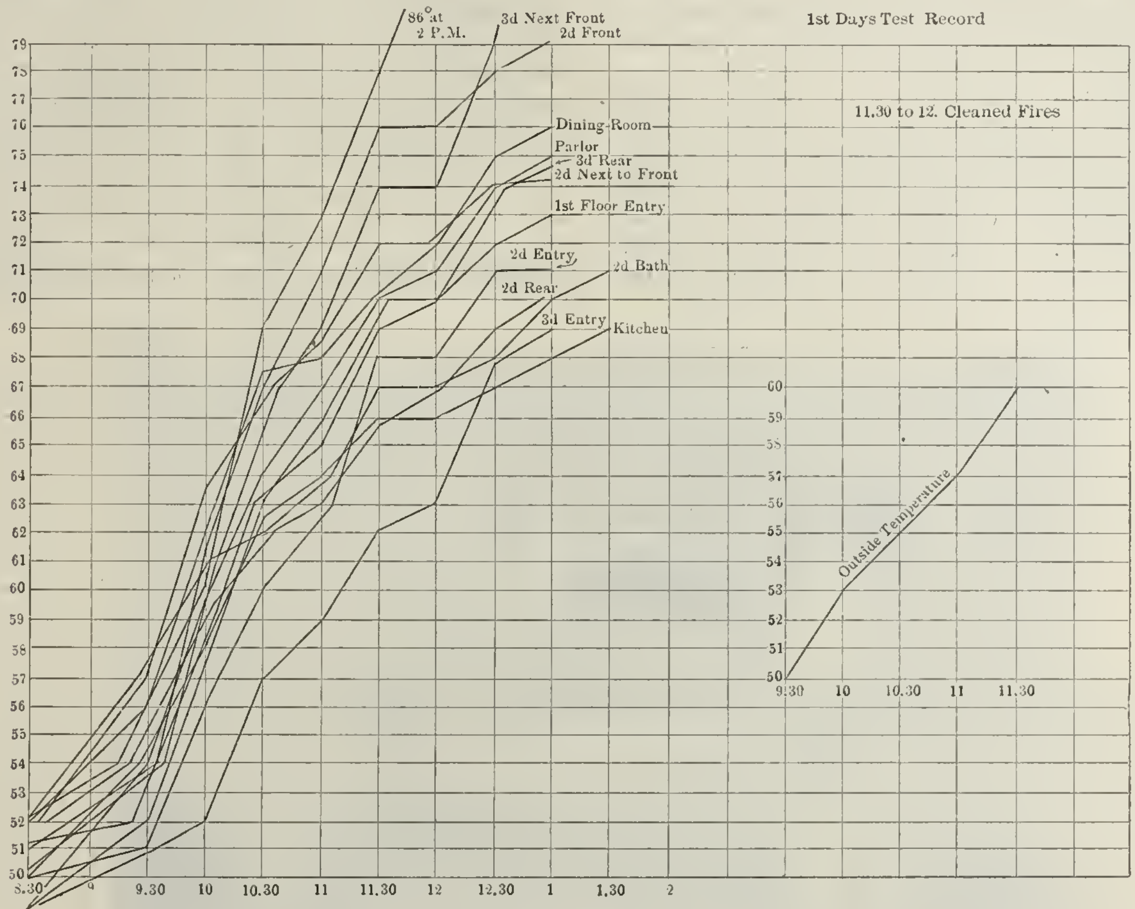
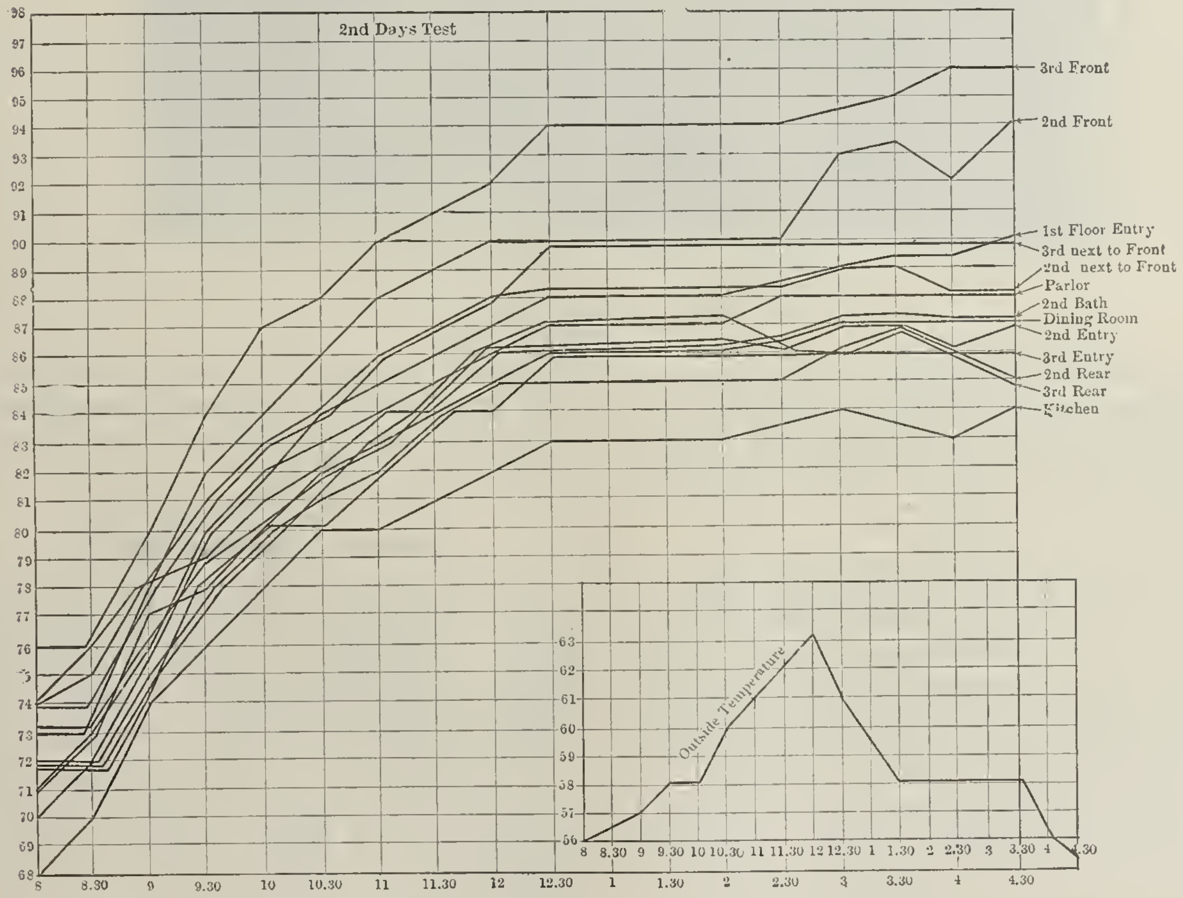
* Paper read at the summer meeting of the American Society of Heating and Ventilating Engineers, at Atlantic City, N. J., June 16, 1902.

higher temperatures of the second and third floor front rooms are due to the direct action of the sun from 3.30 to 4 o'clock. On the second day's record the temperature of the front rooms fell because of the passing of a dense cloud. It would appear from the records of this test that no true test can be made where the walls are damp or where an effort is made to complete a temperature test in too short a time. On massive walls which have been subjected to intense cold for a time before the test is made no test of one day's duration will give even approximate temperature readings of what a plant will do continuously.





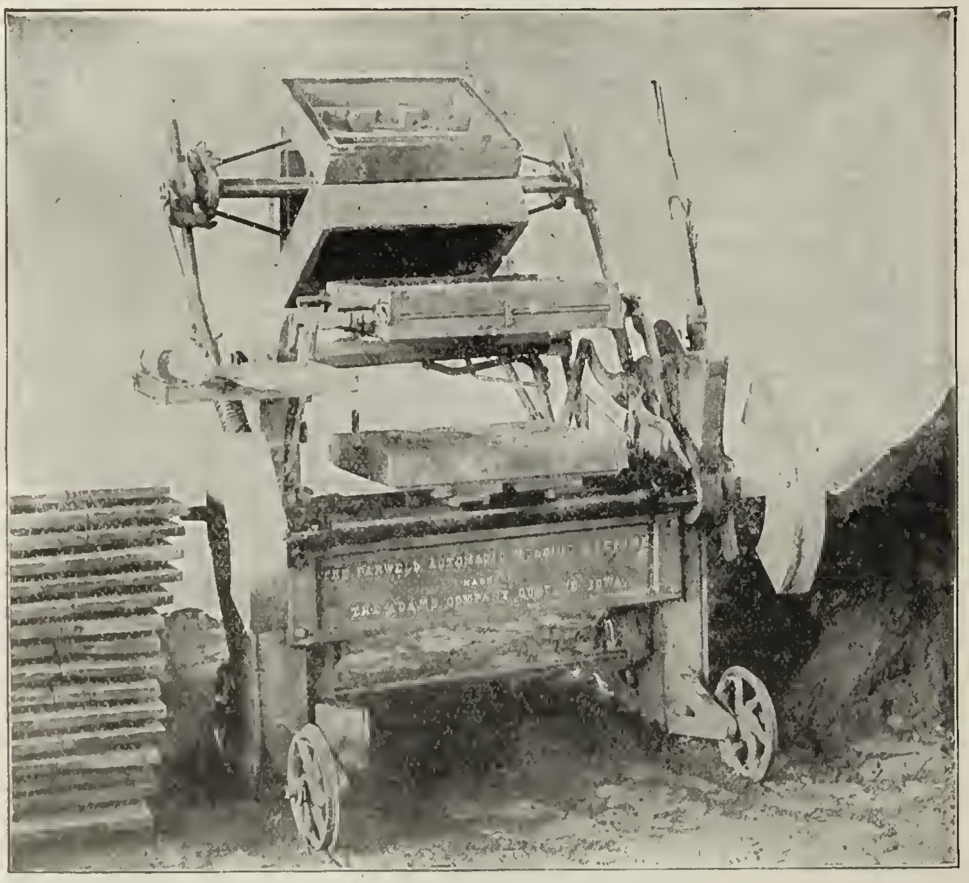
◆

In view of the continually expanding use of celluloid for all sorts of purposes, it will be well for all to remember that celluloid is a highly combustible substance. Not long ago, according to *Fire and Water*, a number of insurance officials were at a dinner in honor of one of their number, and in the course of the after dinner oratory one of the speakers, to make room for the utterance of his eloquent remarks, took a cigar out of his mouth and laid it on the table. The lighted end of the cigar happened to come in contact with the celluloid handle of a dessert knife, and in a moment there was a bright flash and the celluloid covering of the handle began to blaze. The fire was extinguished by plunging the handle of the knife into a finger bowl; but it may be assumed that the insurance men present made a mental memorandum of the properties of celluloid as a fire hazard.

The Farwell Automatic Molding Machine.

The Farwell automatic molding machine, built by the Adams Company of Dubuque, Iowa. is designed to make complete snap mold. It is used with a solid iron tapering flask and match plates, or, as sometimes called, patterns on a plate. By a few rapid and easy motions the operator allows the pattern plate to slide between the cope and drag, and after filling the drag with sand and placing on the bottom board the flask is turned over, the cope is then filled with sand, and the entire mold pressed at once.

The turret top is arranged to do any special peining, and can be made to cut sprues or draw flat gates automatically. The turret top is not necessary for all work, as peining can be done by making the presser board and bottom board of special design. The operation of this machine is simple, and an intelligent molder can understand it in a few hours. One of these machines is now in the ninth year of successful service in the foundry of the Adams Company. It has produced over 700,000 castings, weighing about 8 pounds each, and from the outlook to-day the machine bids fair to continue its usefulness for many years.



The Farwell Automatic Molding Machine.

The Oak and Oakvale Andes Heating Stoves.

We have received from the Phillips & Clark Stove Company, Geneva, N. Y., photographs of two handsome Oak stoves which they have just placed upon the market. They are offered under the names of Oakvale Andes and Oak Andes, and embody features of construction and ornamentation which cannot fail to command the attention of an intelligent trade. The company claim that constructively the Oakvale Andes represents an entirely new idea, in that it is a full return flue Oak stove, with tea kettle attachment, elbow, dust damper, &c., embodying all the essential features of a strictly first-class base burning self feeder. At the same time the point is made that it retains the effective heating features and quality of the best Oak stove. It is made in four sizes. In its ornamentation it is rich and effective, the outlines being graceful and well proportioned. The ash pit section is treated with cast ornamentation in combination with circular nickeled panels; the fire pot is concealed by an open work apron, or foot rail, nickel plated, extending around the front and sides, the front panel carrying the name of the stove. The drum section is effectively treated on both front and sides, while directly above the feed door is a nickeled panel carrying the number of the stove. The top is made to swing and is surmounted by a spun urn of conventional design.

The Oak Andes is a very neat construction, somewhat smaller than the one just described. It is especially well made, has large ash pan, double doors, air tight register dampers, automatic cover in the top, elbow with register and triangular grate. In the ornamentation of the stove nickel has been judiciously employed in combination with the black iron surfaces, and the result is an attractive whole. The fire pot section is covered with a depending foot rail carrying nickel plated fret work, which adds somewhat to the substantial appearance of the heater. The drum section has a cast front and the swing top is surmounted by a spun urn of the same design as that shown in connection with the Oakvale Andes. Considered as a whole, these two constructions cannot fail to be regarded by the trade as very creditable additions to the company's already extensive assortment of heating stoves.

Artistic Enameled Ranges.

We have received from the St. Louis Enameling Company. Ninth and Monroe streets, St. Louis, Mo., a copy of an interesting pamphlet which they have issued, illustrating and describing what is known as the Artistic enameled steel range. The entire body is constructed of cold rolled steel plate, with extra heavy gray iron castings used for the parts that come in direct contact with the fire. The makers state that the draft door on the range is an original feature, it being controlled by means of an eccentric which permits the door to stand at any angle, and which draws it up tight into the recessed flange. The ash door is made in the same way, thus enabling every opening under the fire to be closed perfectly tight. Another improvement in the Artistic is illustrated by the flues, the draft passing around the oven in such a way that its entire surface is subjected to the heat. The oven may be removed, as also can the walls of the range.

In its external treatment, the range is not japanned like other steel ranges. nor coated like granite or enameled ware, but by the company's special Artistic process. The method is to fuse the enamel with the steel under a very high temperature, the enamel penetrating the pores of the steel during the process and appearing on both sides. The claim is made that it cannot therefore either burn or scale off, nor can moisture penetrate the surface. In the catalogue before us the illustrations are presented in a way to give as nearly as possible a faithful representation of the ranges as they actually appear. This is done by means of colored printing, one style of range being finished in "blue mottle," another in "delft," a third in "brown mottle," while others are in "white" and "artistic blue." The ranges are intended for burning hard or soft coal or wood, and are supplied with high shelf, closet, reservoir, or water front, according to requirements. Several pages in the catalogue are given up to testimonial letters from some of those who have used enameled steel ranges.

FOUNDRYMEN VISIT THE WALKER & PRATT STOVE FOUNDRY.

Wednesday of this week was a gala day at the stove factory of the Walker & Pratt Mfg. Company, Watertown, Mass. The American Foundrymen's Association held their annual convention at Boston on Tuesday, Wednesday and Thursday. On Wednesday afternoon they were taken to the stove works for the purpose of seeing a strictly modern stove foundry. To make the trip as enjoyable as possible, the Local Entertainment Committee provided conveyances, consisting of 24 carriages and 18 drags, which afforded accommodations for about 200 foundrymen and their ladies. The party embarked at the Hotel Brunswick in Boston, and after a drive of about an hour and a half through the parks and over fine roads, amid most delightful scenery, arrived at Watertown. Here they were received by A. W. Walker, B. M. Shaw and other officers of the company, who started the party on a tour of inspection. The visitors were delighted to find that the reports of the completeness of this establishment had not been exaggerated.

The works occupy a tract of land comprising about 15 acres, of which 3 acres are covered by buildings, having about 127,000 square feet under roof. The grounds around the works are beautifully laid out, presenting a park-like appearance. The grass is kept neatly cut, and numerous flower beds occupy conspicuous places. The buildings are in keeping with this setting, being attractive in design and finish. Every care was taken for the comfort and convenience of the visitors. They were escorted through the factory over a prescribed route, indicated by white gloved boys placed at various turns. The course lay through the office, sample room, mounting department, mill room, pattern building, foundry, core room, lavatory, stock room, power house and warehouse, back to the place of beginning. The total length of this route was half a mile.

While everything was interesting, by reason of orderly arrangement and scrupulous neatness, the foundry and its appurtenances were especially attractive to the visitors. The foundry has cement or granolithic passageways, which are always clean. The ladles containing the molten iron for pouring are conveyed from the cupola to the various floors by trolleys running on an overhead track, hung from the roof trusses. The lavatory for the men could hardly be finer if intended for the officers. All the appliances are such as to inculcate cleanliness. The wash basins are of marble with mirrors over them, and 100 separate bathing rooms are provided in which the men can bathe themselves before leaving the works. Everywhere through the factory indications of thoughtfulness for the comfort of the men were to be seen. For instance, a coffee room is conveniently located in a portion of the factory, in which the workmen are furnished with coffee at the nominal charge of 3 cents a cup, or 13 cups for 25 cents.

The dimensions of the principal buildings are as follows: Molding shop, 122 x 215 feet; molders' lavatory, 36 x 105 feet; manufacturing building, 112 x 282 feet; warehouse, 152 x 182 feet; pattern building, 60 x 300 feet. The works are located on a branch of the Boston & Maine Railroad, giving them the best railroad facilities. They manufacture ranges, stoves and boilers for steam and hot water heating.

After the visitors had been escorted through the factory they were taken to a tent, which had been erected on the lawn, and served with a dainty collation. All the details connected with the reception of the visitors showed the utmost thoughtfulness on the part of the representatives of the company. An instance of this is observed in the fact that the services of a physician and surgeon had been secured, so that in case an accident had happened to any of the party skilled attention could have been given at once. The excursionists left the ground at 5 o'clock, greatly pleased with what they had seen, and unquestionably with a very high admiration for the products of the company. It will be surprising if there is not a greatly increased demand for the Walker & Pratt products as a result of the kindly feeling engendered by this visit of so many people from different parts of the country.

The fact may be noted in this connection that at the meeting of the association on Thursday evening the annual election of officers occurred, and A. W. Walker, president of the Walker & Pratt Mfg. Company, was unanimously elected president. This honor was conferred not simply as an acknowledgment of what he had done to make the Boston convention a success, but to secure for the association the services in an official capacity of a man who has shown himself thoroughly practical and progressive in developing the founder's art.

William Corry.

William Corry, the veteran stove man of Water street, New York, so well known to the manufacturers and dealers of the United States, and formerly of the firm of Southard, Robertson & Co., will assume the management of the Stove Manufacturers' Repair Association, 230 Water street, which was formerly under the charge of W. B. Betts, lately deceased. Mr. Betts died suddenly on Thursday, June 19. Mr. Corry has enjoyed a long vacation, much to his physical benefit and, it is whispered, to his financial good also. The latter he denies. He says he is "the victim of too much zealousness on the part of the city fusion government, as they propose to clean out the tramps and won't allow them to run on my beloved Bowery. A fellow has got to make a show or a bluff that he is either a capitalist or a workman, as hundred-dollar millionaires do not go with the captain or the wardman now. So they just run me back to Water street. Ever since Johnnie Allen and Kit Burns quit the street it does not look natural, but they could not all be with us."

ODD PLATES.

Charles A. Stockstrom of the American Stove Company has purchased a lot on South Ninth street, near Chouteau avenue, St. Louis, Mo., immediately adjoining the plant of the Quick Meal Stove Company. The rapidly increasing business of this division of the American Stove Company is such as to necessitate greater facilities, and some new factory buildings will be erected in the near future.

Plans have been prepared for the new plant of the Wireton Heating Company, at Chicago Heights, Ill., to replace the company's former plant at Blue Island, that was destroyed by fire early in the year. The buildings will include a foundry, machine and tin shop, boiler and engine house and warehouse, the latter covering 100 x 200 feet. All the buildings will be of brick and stone and of mill construction. The total cost of the plant is estimated at $125,000.

The S. Obermayer Company, manufacturers and dealers in Foundry Equipments and Supplies, are operating their three plants at Cincinnati, Chicago and Larimer on double turn, in order to keep pace with their business, which has been very heavy.

The Chattanooga Stove Company, Chattanooga, Tenn., have contracted for an additional four-story building. 50 x 150 feet, to cost $15,000. They have also decided upon increasing their molding department to about double its present capacity.

A. C. Werner and C. H. Henderson have consolidated their business under the firm name of Werner & Henderson, at 18-28 Grand avenue, Kansas City, Mo. The company handle the Graff Furnace Company's Hero and Comfort Warm Air Furnaces. Mr. Henderson has been the Graff Company's agent for several years and has succeeded in placing a large number of their Furnaces in Kansas City. The firm are also manufacturers of Galvanized Iron Cornices, Skylights, Guttering and Spouting, &c.

The new foundry of the Peck-Williamson Heating & Ventilating Company of Cincinnati, Ohio, to be erected at Wellston, Ohio, will have capacity of 100 tons a day and will be operated by a new company, to be called the Peck-Williamson Foundry Company, with a capital of about $100,000. The stock of the company will be held entirely by the parent concern at Cincinnati, and the concern will not only manufacture Castings for their own use, but will also do a general jobbing foundry business.

The Nickel Plate Stove Polish Company, Chicago, Ill., have just placed upon the market a new Stove Polish which they have named the Black Kid. They feel so well convinced that it will give entire satisfaction that they recommend those who purchase it not to pay for it if it is not the best ever used. What the company have to say in their announcement in another part of this issue may not be without interest to Stove and Hardware dealers generally.

The Kinsey Mfg. Company of Dayton, Ohio, have just been incorporated with a capital stock of $50,000, for the purpose of engaging in the manufacture of Stoves.

During the past week engineers have been engaged in laying out the ground at Beaver Falls, Pa., for the new plant of the Pittsburgh Stove & Range Company.

Colors That Harmonize.

United States Consul-General Richard Guenther of Frankfort, Germany, sends to the State Department a report on the painting of machinery, taken from the *Welthandel* of that city, which contains some suggestions that may be of use to some of our readers, especially those who are taking up the decoration of stamped sheet metal interior fittings. The authority quoted says, relative to the painting of machinery, it has been found that a great lack of taste is often apparent. The machines are frequently smeared over with the loudest colors, which harmonize poorly, hurt the eye and spoil the general effect of the machine. For instance, machines have been observed where brilliant red and scarlet were combined with brilliant blue and yellow in the most peculiar manner. Such a combination of colors, of course, violates all the laws of harmony, which demand that one color should supplement the other, in order to make the whole appear well proportioned and pleasing to the eye.

A correspondent, writing to an English technical journal, says that the supplemental color of red is green, of blue, orange, and of yellow, violet. Strict rules, however, cannot be fixed, as much depends upon the artistic taste if intelligent eyes are consulted. The following hints as to artistic color contrasts, however, may be found useful:

1. Black and deep brown.
2. Violet and light green.
3. Violet and light rose.
4. Deep blue and golden brown.
5. Chocolate brown and light blue.
6. Dark red and gray.
7. Chestnut brown and deep green.
8. Dark blue and light red.
9. Chocolate brown and pea green.
10. Chestnut brown and deep blue.
11. Claret color and reddish yellow.
12. Black and deep green.
13. Slate with almost all light colors, except blue.
14. Reddish yellow and black.
15. Reddish yellow and blue or lilac.

Increase in the World's Copper Production.

In the annual statistics of the world's principal copper supplies issued by Henry R. Merton & Co., Limited, of London, a general increase of production abroad is noted for 1901, while in this country a slight decline is shown. The latter can be accounted for by the curtailment of operations due to litigation and to accidents. The total increase for 1901 above 1900 was 26,092 tons. In the matter of increase Canada is foremost, with 10,300 tons beyond the figures of the year previous. Australia increased almost 8000 tons and Chile went 4300 tons higher than in 1900. Practically all other producing countries increased with the exception of the United States, where a decrease of 1317 tons is noted. The table shows that in this country there was a 1000-ton reduction in the case of Calumet & Hecla, but other lake producers gained 2899 tons. The Montana district lost 8787 tons, and Arizona gained 4803 tons. Other States lost 1292 tons, as compared with the year previous.

Below we give a summary of the table showing the totals for the last three years:

In tons of 2240 pounds.

	1901.	1900.	1899.
United States	267,410	268,787	262,206
Canada	18,800	8,500	6,730
Spain and Portugal	53,621	52,872	52,168
Chile	30,000	25,700	25,000
Japan	27,475	27,840	28,310
Germany	21,720	20,410	23,460
Mexico	23,795	22,050	19,335
Australia	30,875	23,000	20,750
Cape of Good Hope	6,400	6,720	6,490
Russia	8,000	8,000	7,210
All other countries	24,030	22,160	20,351
Totals	512,131	486,039	472,244

The figures for the United States should be received with reserve, since they are not official.

To Avoid the Expense of Filters.

A new plan has been proposed at Pittsburgh, Pa., says *Fire and Water*, to avoid the expense of filtration as the Board of Public Works intends the process to be carried on. The city should buy Six-Mile or Nine-Mile Island and dredge out a basin 20 feet deep, 300 or 400 feet in width and 1000 feet long; throw up an embankment around the outside 10 feet higher than high water mark, and riprap around the outside so that it should not be washed away or damaged during floods. The water of the Allegheny River flows over sand and gravel with a thickness of 20 feet and there is an undercurrent of water passing through this gravel and sand. By the building of the mammoth well suggested it is figured the basin would fill with water passing through this sand bed—thus ridding it of the impurities with which it is impregnated in its raw state. The fear of some that the sand and gravel would become clogged in years and render the process of cheap filtration ineffective is held to be groundless. The flow of the water through the gravel has continued for generations, and it fills all the water wells that are put down on both sides of the valley. Official tests, however, have demonstrated that at Brilliant while the filtering of the water through the sand and gravel of the bed of the river rendered the water somewhat purer, still it added hardness to it, and Superintendent Shepherd declares that it could not be used for steam making purposes. The quality of water would doubtless be the same in the proposed big basin plan as in the driven wells at the side of the river.

The threatened strike of the molders in the Pittsburgh district has been averted. The National Founders' Association has given the men an advance of about 6.66 per cent., with a minimum rate of $3 per day. The men asked for an advance of 10 per cent. and a minimum rate of $3.30 per day, but their demand was compromised. The new scale of wages is in effect for one year from July 1 next.

The Twentieth Annual Convention of the National Association of Master Plumbers.

Tuesday, June 17, opened with a cool, bracing air after a rainstorm, and Atlantic City, N. J., was at its best when the twentieth annual convention of the National Association of Master Plumbers, with more than 400 delegates, was called to order by President E. D. Hornbrook at 11.15 a.m.

The president appointed Frank Walsh and John Moore sergeants-at-arms, and instructed them to see that no delegate left the hall without an excuse. The expenses of delegates are paid by the local association, so that they may attend the conventions, transact its business and report its acts for their information. The officers, therefore, should not allow the delegates to leave the hall.

Owing to Mayor Franklin P. Stoy being detained at the Hotel Marlborough to welcome the Southern Hardware Jobbers' Association, Van Buren Giffen of the Atlantic City Master Plumbers' Association, on behalf of the Mayor and his city, extended a hearty welcome to the delegates. He said: "I am surprised to see so many delegates from all over the country. Our association having only recently become connected with the national body had nothing to do with your coming to Atlantic City, but we welcome you and promise to make your stay one of pleasure and benefit. I give you, on behalf of the Mayor, the freedom of the city."

President Hornbrook expressed the thanks of the delegates and their pleasure at being so pleasantly welcomed by one of the trade.

The president then addressed the convention, expressing his pleasure at seeing so large a number present. He said that matters of importance would come up that should interest every member, and hoped that no one would consider pleasure before duty. If the delegates would give attention to the meetings and report to their associations the national officers would not be asked questions that have been answered in print years ago. Mr. Hornbrook then announced the following Credential Committee: D. J. Shannon, J. E. Holmes, J. King, Ira Budd and Chris Irving.

The Convention Entertained.

While the Credential Committee were completing their report the convention was entertained with recitations. Mr. Hitchcock recited "The Man They Call the Plumber" and "Universal Brotherhood." William McCoach gave a new version of "Barbara Frietchie," and P. H. Callahan recited "When Casey Slugged the Ball," the last verse of which is as follows:

> Now he keeps a plumbing shop,
> He's Mayor of the town,
> He puts in pumps and water tanks
> In all the country 'round.

He also gave "Little Jim," and secured the lion's share of the applause.

Daniel Shannon then presented the report of the Credential Committee, showing the following delegates in attendance:

List of Delegates.

ALABAMA.

Anniston, D. A. Farrell.
Birmingham, C. R. Ross, R. W. Gayle.
Huntsville, A. J. Murdock.
Mobile, Thos. J. Young, Chas. J. Simmons, Sam'l D. Copeland.
Talladega, P. E. Michael.

ARKANSAS.

Fort Smith, August Richert.
Hot Springs, G. A. Callahan.

CALIFORNIA.

Los Angeles, C. H. Mannell, L. A. Scholes, T. J. Stephens, C. T. Paul, Geo. Howe, A. H. Longley.
San Francisco, J. L. E. Firmin, W. W. Wilson, G. C. Sweeney, G. C. Dallamore, J. McCusker, J. Looney, S. Peterson, M. Cohen, A. Newmark, E. Snook, G. Eastman, G. Young, E. Grundy, James E. Britt.

COLORADO.

Denver, Chris Irving, Peter E. Snow, Jas. J. Johnson, J. F. Van Daniker, Jas. J. Small, Roderick McIver, J. H. Winters, George E. Smith, W. T. Crean, Thos. H. O'Brien, P. H. Balfe.

CONNECTICUT.

Bridgeport, M. W. Manwaring, J. F. Brady, L. H. Mills, F. O. Booth.
Middletown, James Donovan.

The convention then adjourned to meet at 2.30 o'clock.

TUESDAY AFTERNOON.

The convention was called to order at 3.45 o'clock by President Hornbrook, who asked for a volunteer reading clerk, and David Craig of Boston responded. After 50 names were called, a motion to accept as the roll call was lost after argument to the effect that it gave an opportunity to discover who accepted election as delegates for pleasure only and were delinquent in attending the meetings of the convention, and the roll call was completed.

The president, on motion, appointed the following Committee on Resolutions:

D. J. Hickey, Chicago.
James E. Britt, San Francisco.
C. W. Hobson, Lawrence, Mass.
Isaac J. Brown, New York.
Samuel W. Barnes, Philadelphia.

Resolutions.

Resolutions covering grounds as follows were then read and referred to the above committee:

An amendment to the by-laws making it necessary for the National Executive Committee to refer all changes made in the trade resolutions agreed upon at conferences with the supply trade to the local associations for ratification one month after conference, to make the agreement binding.

A resolution to substitute for the "Cleveland Resolutions" one to the effect that goods be purchased only from those manufacturers who refrain from selling goods to any but members of the association, to prevent the plumber from being placed in a false position who must charge more than the supply trade which sells to the consumer.

Owing to the failure to effect the substitution of the "Cleveland Resolutions" *Be it Resolved*, That the Executive Committee be instructed to take action to secure an agreement with the supply trade for the good of the whole trade in removing the constraint that now exists.

The presentation of resolutions was interrupted for the purpose of welcoming Mayor Franklin P. Stoy. Mayor Stoy extended to the important visitors a hearty welcome, and explained that a slight error caused the delay in his arrival at the convention, but assured the delegates that it gave him pleasure to extend to them the freedom of the city. President Hornbrook gracefully accepted the favor for the convention.

The presentation of resolutions was then resumed, as follows:

Resolved, That it is the sense of the convention that the national secretary be informed whenever a strike exists in any city, he to notify the trade, so that no journeyman from the strike center can secure work until he can give a satisfactory explanation from his former employer.

Resolved, That the convention approves of the "Cleveland Resolutions," and the following shall be a part: The plumbers shall be divided into two classes. Class A to be composed of members of the association, who shall buy supplies 20 per cent. lower than Class B, which shall include the nonmembers.

Recognizing that it is best for the trade when friendly relations exist between the plumbers and the journeymen, *Resolved*, That the convention recommends the appointment of conference committees in all local associations.

Report of Essay Committee.

The report of the Essay Committee was then presented and ordered printed in the proceedings of the convention. The report is as follows:

Your Committee on Essays regrets that its work of the year should fall so far short of the results which might have been attained if the members of the association were not inclined to leave to the members of this committee not only the suggestions for subjects of essays, but the production of the essays themselves.

Article XII of the by-laws is as follows:

> The Essay Committee shall consist of five members, whose duty it shall be to select subjects for the different local associations.

Soon after the announcement of the *personnel* of this committee your chairman made an attempt to get the opinions of its various members as to the outline of prospective work. Only two members (besides your chairman) responded, and later attempts toward the same end met with the same results. When the approaching close of our official year compelled some action by the three active members a circular letter was prepared, with suggestions of subjects as follows:

To Officers of Local and State Associations:

Will you kindly solicit from your membership short essays upon subjects of interest to the National Association? While not confining the writers to these, we would suggest as subjects the following:

1. Future of the master plumber.
2. The effect of trusts upon our trade (nonpartisan, from a business point of view).
3. Necessity of a more thorough organization of the trade.
4. How can our membership be increased?
5. How should the plumbing business be conducted to be most successful?
6. Is the present system of credits for the interest of the trade?
7. Why is subcontracting detrimental to the plumber?
8. Why is the publishing of net prices and discounts hurtful?
9. Is the present plan of organization of the National Association conducive to the best interests of all sections?

If you can assist our committee in securing something to present to the coming convention at Atlantic City you will greatly oblige the committee.

M. W. Manwaring. Chairman Essay Committee.

We accepted the offer of our watchful and diligent president to have these letters printed and circulated through the executive office. In order to give the greatest scope, contributors were allowed to select any subject, though certain subjects were suggested. It seems to your committee that this matter does not appear to meet with suitable responsive action from our members. There are a great many in our membership competent to make this department both interesting and beneficial. The helpfulness of an interchange of ideas cannot be overestimated; and some plan should be devised to cultivate this feature of our organization. Under present conditions it seems as though the members were apt to consider the preparation of such essays as the duty of the Essay Committee, and forget the support owed to them.

Your committee begs to suggest that the chairmanship of this division be made a part of the duties of the vice-president, and that the selection of the other members of the committee be left to him. We believe this change would result in the submission of essays on subjects along the line of policy of the executive boards, and therefore of great value to the association.

We respectfully submit the foregoing report, together with the accompanying essays and articles which have been forwarded to us.

M. W. Manwaring, Bridgeport, Conn.
F. Wernentin, Jr., Davenport, Iowa.
C. H. Avery, Nashua, N. H.

How Can Our Membership Be Increased?

BY WILLIAM F. QUINN, TROY, N. Y.

This is a subject (and at this time an important one) that should interest every member of this association. Upon the increase in membership during the coming year will depend in some measure the future welfare and prosperity of the association. From the report presented at the Baltimore convention by the financial secretary (June 12, 1900), and the report of President Tierney at the Kansas City convention of 1901, it would seem that the increase of membership should receive more attention from individual members than it has done in the past.

If the National Association of Master Plumbers is a good thing, and a benefit to its 6000 members, it ought to be just as good and just as beneficial to the 6000 members of the trade outside the association; and every possible effort ought to be made to bring this vast number of "way backs" into the fold. This can be done by making it known and felt in all parts of the country that a membership in the Master Plumbers' Association of the United States means dollars and cents in the individual members' pockets; and when he who is now outside the breastworks learns that when he has secured membership within our portals he can make better terms with those from whom he purchases his supplies he will lose no time in making his application—in fact, he will find it necessary to do so without delay. Once you get him inside the breastworks—once he attends a national convention of this association and meets with some of the brightest minds of the country—once let him associate with his fellow delegates and his fellow craftsmen—and you have an "organizer." And when you increase the membership by such means the additions will be constant and continual; and ere long, perhaps ere another national convention, our membership may be increased 50 per cent.

The Cleveland Resolutions, with the addition of such ways and means whereby some arrangement might be made with the supply associations to bring about such results—together with a hustler at the helm, as there has been during the past year, backed up by a conservative and brainy Executive Committee—such, in the judgment of the writer, will be the best answer to the question, "How can our membership be increased?"

How Should the Plumbing Business Be Conducted to Be Most Successful?

BY CHARLES H. HOBSON.

In order to discuss the question intelligently it will be necessary, perhaps, at the outset to agree upon a common definition as to what constitutes success. In the opinion of the great majority, success means the accumulation of money through large profits, or fair profits on a large business; but if carefully analyzed I think we must agree that the profits are rather the result of one element of success—thrift—and that it is possible to accumulate wealth in the business and be unsuccessful, or on the other hand to fail to secure wealth and yet be successful.

Those who have been engaged in the business 25 years or more have passed through the chrysalis stage which has transformed plumbing from a trade into a profession; and now that the change has come about and plumbing is a profession, it seems entirely fitting that the master plumber should become a sanitary engineer.

But changing the name does not alone effect the transformation. We must also acquire the added education necessary if we wish to make a success of our profession. The plumber of to-day relies on books and papers (inspired by men in other professions) to assist him; but the sanitary engineer of the future must be an authority on all matters of sewage, water supply and ventilation, he must have made a study of biology and bacteriology, and must be a student of the liberal arts and sciences. He should be essentially a business man and merchant; and as such he should individually—and collectively with his brothers in the profession—insist upon business methods in his transactions with those from whom he buys as well as those to whom he sells.

The material used in connection with the sanitary equipment of a house should be strong, durable and artistic, and to this end we should bend all our energies. There should be certain standards adopted by manufacturers and plumbers, which should be rigorously adhered to by members of our association. As far as possible there should be enacted State and national legislation toward the same end. Labor should be classified, and an effort made to have the labor unions co-operate with us for this purpose.

Every journeyman should have his certificate as a first or second or third class workman. The effect of this would be to give the purchaser just what he paid for, which I regret to say is not always the case at present, as oftentimes a second-class man is sent where a first-class price is charged. Honesty toward our customers is the chief element of success, and honesty to ourselves goes hand in hand with it. In the past there has been no business regarded by the public with greater distrust than ours. Ruinous competition, especially in contract work, has been a stumbling block in the pathway of success; it is responsible for nearly all the dishonesty and bad work and bankruptcy and distrust. This is one of the most difficult questions to deal with, but with thorough organization and educational talk relative thereto much good can be accomplished.

One step in this direction which would prove beneficial would be the adoption of local or district price-lists along conservative lines. Let such price-lists be published and distributed openly to customers, signed by all the local association members—and afterward discourage all contract work. The plumber should never lose sight of the fact that he is also a merchant, and he should keep a neat and tidy store and office. His shop windows should be bright and well lighted and contain samples of up to date goods, arranged in the most artistic manner; and as to the general stock, there should be a place for everything, and everything should be in its place.

One thing calculated to discourage underestimating would be for the plumber to keep a strict account of the cost of each contract, in order that he may be confronted by his losses, or in some few cases, perhaps, by his gains. In this connection let him keep an account of his expenses (or unproductive items) for one year, such as rent, fuel, light, teaming, freight, express, clerk hire, stationery and all the numerous little details attendant thereto; and if he has not already done so, let him compare the expenses with the total volume of his business, and he will find that when he figures a job on a basis of ten per cent. profit he has actually made no profit whatever (and perhaps even a loss), as the expense account will generally run nearer 15 than 10 per cent.

I have tried to touch upon what seemed to me the most essential points in the conduct of a successful business, and to touch on them as briefly as possible. There is doubtless much more which could be said, but if we initiate a campaign of education along these lines it will not be long before we should all see success, professional and financial.

An essay by T. C. Boyd was referred to the Committee on Resolutions, on account of the following recommendations contained therein:

Resolved, That the price-list of no manufacturer be used that is not subject to a discount of at least 50 per cent.

Resolved, That purchases of materials be confined to those houses which give credit only to those entitled to it, and preferably to those which confine their sales to our members.

The convention then adjourned to meet at 10 o'clock on Wednesday morning in executive session.

THURSDAY AFTERNOON.

After spending the whole day of Wednesday and Thursday morning in executive session the convention went into open session at 3.30 o'clock on Thursday afternoon. The report of the financial secretary, T. Cotter, showing receipts for the year amounting to $11,396, was referred to the following Auditing Committee appointed by the president: P. H. Callahan, E. C. Kelly and H. L. Brown. A paper on "Sanitary Conditions of New York City," by P. J. Andrews, Chief Inspector of Plumbing of New York City, was then read, and ordered printed in the proceedings. The report of Treasurer W. E. Goodman was read and showed the receipts for the year to be $18,334.44, and the expenses $8447.99, leaving a balance in hand of $9886.45. The report was referred to the Auditing Committee. The president then called L. Poplowsky to the chair.

A motion to rescind that portion of the by-laws which prohibits local associations from acting as wholesale dealers and supply houses was lost.

On motion, the secretary was ordered to inform local associations of the action of the convention in reference to catalogues and price-lists.

On motion, a special committee was ordered to be appointed to draft suitable resolutions on the death of ex-President Samuel L. Malcolm.

Election of Officers.

On taking up the election of officers, W. H. Doyle expressed the opinion that it would be best to tie to the old customs in elections and nominated for president Charles A. Polacheck, whose name was received with applause.

Charles A. Polacheck then nominated for re-election President E. D. Hornbrook, whose name was greeted with cheers and applause.

On motion, the secretary was instructed to cast one ballot for the unanimous election of E. D. Hornbrook. Frank J. Reynolds and J. B. Collins were appointed tellers, and on announcing the election of E. D. Hornbrook for president the cheers lasted two minutes.

The newly elected president was warmly greeted, and in accepting the office closed his remarks with the statement that the "Cleveland Resolutions" could be of the greatest service if the members were loyal. He also assured the convention that to be re-elected president of the association gave him the proudest moment of his life.

Charles B. Huck, in a very earnest speech, nominated for the office of vice-president Charles A. Polacheck, which nomination was received with great applause. The secretary was instructed to cast the ballot of the association for Charles A. Polacheck for vice-president. The announcement of his election was greeted with prolonged cheering until he was presented to the convention by President Hornbrook. Mr. Polacheck, in accepting, said he was delighted that the re-election of E. D. Hornbrook had been accomplished, and that it was no small honor to be re-elected to the second highest office in the gift of the association. He also spoke of the great service rendered by the plumber to the welfare of the whole public.

John L. E. Firmin placed in nomination for the treasurership the name of William E. Goodman, who, after some applause and much eulogy, was duly elected.

The president announced the appointment of Timothy Cotter as secretary, which was indorsed by the convention.

The president then announced the appointment of the following committee to prepare resolutions on the death of ex-President Samuel L. Malcolm: Chairman, John L. E. Firmin, A. H. Brown, W. H. Doyle, D. G. Finnerty and Charles H. Byrne.

California to Have the Next Convention.

After a number of speeches in eulogy of Mr. Malcolm, telegrams and letters were read from several cities inviting the association to honor them with the next convention. California was strong in its invitation, several cities supporting it. Invitations were also received from New Orleans; Put-in-Bay Island, Lake Erie, Ohio; Memphis, Tenn., and Atlantic City, N. J. After a thorough exploitation of the many attractions of each of the places mentioned the invitation of San Francisco was, on motion, accepted.

Executive Committee.

The Auditing Committee reported the books of the association to be correct.

The president then announced the appointment of the following Executive Committee:

T. F. Gaynor, New York.
T. J. Young, Mobile, Ala.
P. Tierney, Providence.
George Kirkhoff, Indianapolis.
L. Poplowsky, Cleveland.
W. B. Coffey, Portland.
C. C. Breyer, Chicago.
Jos. A. Weldon, Pittsburgh.
Fred. Fox, Jr., Chattanooga.
J. J. Foy, St. Louis.
David Craig, Boston.

The usual votes of thanks were then given, and the convention adjourned.

CHIPS FROM THE SHAVE HOOK.

The meetings were held on the Steel Pier in the Auditorium, and in order that the delegates and their friends should have free acess a magic mirror was furnished them, which had a celluloid back bearing the motto of the association, "They Builded Better Than They Knew," and the date, "1883," when the N. A. M. P. was instituted.

* * *

It is Lawyer Crosby now; so look out how you badger the executive clerk.

* * *

McCoach had a room on the same hall as your scribe, and he sang loudly if not sweetly at whatever hour he came down the hall to retire.

* * *

Ex-Presidents W. H. Doyle, Jeremiah Sheehan, Daniel Finnerty, P. Tierney and President Hornbrook all expressed regret over the recent demise of ex-President Samuel L. Malcolm.

* * *

The John Simmons Company of New York had a fine exhibit of fire department supplies, such as plumbers are now installing in modern buildings. It was in charge of Howard Walton.

* * *

The Kennedy Valve Company of New York were represented by M. J. Brosnan, who talked of valves, hydrants and automatic sprinkler equipment.

* * *

Murray G. Millikin was the advance agent for the H. Mueller Mfg. Company of Decatur, Ill. He was followed by Fred. B. Mueller, Philip Mueller and W. L. Heinrichs, who made a fine showing of brass goods and specialties. They were popular, notwithstanding that they caned most of their visitors.

* * *

The merits of the Lamb & Ritchie, Cambridgeport, Mass., tin lined and lead lined iron pipe were made clear by Albert P. Briggs, who also showed a picture of the medal awarded this firm at the Pan-American.

* * *

Thomas K. Peters of the Steam Appliance Supply Company of St. Louis showed a new chain pipe wrench that the house are about to put on the market.

* * *

John W. Cooney of New York was interviewed by many who are interested in his methods of doing a big job quickly.

* * *

M. A. Daly of the Noppel Pump Company of Hartford, Conn., found many interested in his special appliance for testing systems and removing obstructions from waste and service pipes.

* * *

Charles V. Daiger, H. J. Stanscombe and V. C. Doyle made a display of gas fixtures that attracted much attention to the products of the Lawrence Gas Fixture Company of Philadelphia. Prince Henry mirrors and celluloid memorandum tablets were their souvenirs.

* * *

Henry Sieben represented the Sieben Mfg. & Supply Company of Kansas City, Mo., as only he can. He had a fine display of the Sieben traps and specialties made by the company, who have recently increased their capital and equipment so as to meet promptly the growing demand for these goods.

* * *

I. N. Glauber and Alex. Buchman of the Glauber Mfg. Company of Cleveland, Ohio, had a fine display in Parlor 37 of the antiques and curios gathered while they were in Europe. They gave to their visitors a paper weight in the form of a bronze frog.

* * *

Thomas Kelly of Chicago wore the oldest badge that was shown at the convention. It was of the vintage of 1883.

* * *

So many showed an interest in the variety of asbestos pipe coverings and insulating materials made by the H. W. Johns-Manville Company of New York that Manager T. T. Lyman stayed through the convention, assisted by George F. Gilbert, sometimes called " Sam," who has no pipe dreams but pipe insulation adapted for any purpose. Visit Mr. Lyman or send for " Sam " and " Sam-pulls."

* * *

H. E. Speakman did the honors and W. A. Speakman did the work for the Speakman Supply & Pipe Company of Wilmington, Del. They have a new ventilated urinal that presents attractions to those who study the sanitary side of plumbing fixtures. The company's circulars, which come in a set, show it up nicely.

* * *

Mustee Brothers of 204 Cedar avenue, Cleveland, Ohio, showed their new Marvel gas hot water heater, which presents a large amount of surface and looks like an effective heater. It is constructed with a view to durability. They gave out a circular that explained its many excellent features, including long water travel and large surface.

* * *

C. Theo. Campbell presented his cards from the New York office of the W. H. Page Boiler Company and proved an able assistant to N. E. Frost.

* * *

The Duplex testing plug, invented and shown by August T. Pflugh for the New Jersey Plumbing Specialties Company of 106 Adams street, Hoboken, is made of malleable iron, provided with the best rubber gaskets, and adapted for all sizes of pipe from 2 to 6 inch.

* * *

" It is not so much that these bibs are something, but rather that they are something better " is the way a bib circular opens up that the boys from the H. Mueller Mfg. Company of Decatur, Ill., presented at their exhibit of fine brass goods in the Grotto.

* * *

W. E. Delehanty showed for Peck Bros. & Company of New Haven, Conn., the Peck's Universal sanitary closet connection, in which asbestos is used instead of putty or rubber. The practical men thought well of it, and took one of their booklets describing the device. All the Yankees asked, " Where's Steve Baker? "

* * *

A. D. Fiske Adams cracked up Alberene stone for all sanitary uses, and incidentally mentioned sinks and laundry trays for the Alberene Stone Company of 393 Pearl street, New York.

* * *

Emmett Martine of Fort Wayne, Ind., showed miniature cellar traps that prevent trouble from back water and have many other virtues.

* * *

The W. S. Cooper Brass Works of Philadelphia, Pa., were ably represented by F. S. Merwin, who is prepared to place orders for anything needed for the most luxurious Atlantic City hotel or any other kind of a building.

* * *

A. C. Langston, the Southern representative of Jenkins Brothers of New York, came up from Atlanta, Ga., to the Southern Hardware Jobbers' Convention at the Marlborough, and ran up the board walk to see Le Compte & Webber, who were still at Parlor G dispensing hospitality to the delegates.

* * *

W. H. Crookston of 185 Wooster street, New York, said little about the Acme pipe joint cement and plumbers' supplies, but enjoyed meeting his many friends in the plumbing trade.

* * *

James J. Lawler had Room 328, where he entertained his guests with talks on the specialties made by the Lawler Water Feed & Damper Regulator Company of 181 Mercer street, New York.

* * *

The neat pocketbooks presented in the interest of the Monarch Sunshine boilers, made by Orr, Painter & Co., Reading, Pa., enhanced the popularity of the house and the man who handed them out.

* * *

W. H. Switzer, vice-president of the Utica Heater Company of Utica, N. Y., was ever present. He knew the delegates from every section, and developed quite an interest in the Imperial Sectional, Auburn and New Keystone boilers, the points of which were fully explained by him.

* * *

Harry S. Martin of the United States Radiator Company of Dunkirk, N. Y.; M. E. Danforth of Washington, and W. S. Appleton of the New York office sowed good seed for the extensive line of radiators made by the company.

* * *

The No. 1 Mercer boilers and the Wall radiator exhibted by the H. B. Smith Company of Westfield, Mass., received as much attention from the plumbers as from the steam fitters and engineers when explained as it only can be by J. C. Faulkner.

* * *

The Pierce, Butler & Pierce Mfg. Company of Syracuse, N. Y., left the plumbers to the attention of W. H. Peterson and W. B. W. Bryan of the Philadelphia office, and the prestige of the American and Florida boilers was pleasantly extended.

* * *

C. V. Haynes of the Philadelphia office of the American Radiator Company assisted George Downe of Chicago in bringing the Ideal boilers and American radiators to the attention of the plumbers.

* * *

Thomas N. Chalfant of the Vapor Steam Heating Company of Philadelphia found many eager for information about their new method of heating buildings.

* * *

E. E. McNair of the Niagara Radiator Company of Buffalo, N. Y., brought many plumbers down to see the fine show of radiators he had in the Grotto.

* * *

A convenient tape measure in a celluloid case distributed at the close of the convention at the Auditorium by Jas. B. Clow & Sons caused quite a struggle to secure the coveted souvenir.

* * *

R. O. Kriebel of the United States Heater Company of Detroit talked Capitol and Mascot boilers to the plumbers.

HO! FOR CALIFORNIA.

One of the most enjoyable features of the convention was the trip to California by stereopticon given on Tuesday evening at the Rudolf by William McMurray, agent of the Information Bureau of the General Passenger Department of the Southern Pacific Company. Mr. McMurray and J. T. Hendricks of the Philadelphia office of the Union Pacific Company left nothing undone that might lead to the selection of California as the place for holding the next convention. The fine exhibition of photographs of California scenery and the handsomely illustrated literature distributed during the daytime only needed the trip to California by means of 200 colored lantern slides to increase the number of supporters already favorable to a California convention. The ladies were particularly earnest in their efforts to that end. J. D. McCann, of the Missouri Pacific Railroad Company, who has had charge of the New York plumbers in many of their railroad trips, was a popular railroad man, and lent his assistance to the efforts of

Messrs. McMurray and Hendricks. "Joe" promises the best the road affords, if the plumbers travel to the Land of the Sunset.

At 4 o'clock on Thursday afternoon the California organization had rolling chairs at the Rudolf, and the ladies were taken up the board walk to the inlet and then to the convention hall, where the selection of a place for holding the next convention was being considered. A. M. Longacre of the Southern Pacific Company came down from Philadelphia in time to lend his assistance to the successful efforts of the Pacific Coast advocates.

CALIFORNIA COURTESIES.

As a sample of the courtesies that are customary in California a case of the best wine and cigars the State produces was sent to President Hornbrook and the members of the Executive Committee. Its value as a souvenir, was highly esteemed, and after the officers had been duly remembered, the president delegated to Mrs. Hornbrook the disposition of the remainder. We are pleased to acknowledge the gracious compliment bestowed upon *The Metal Worker* in being the recipient of a bottle of combined California and Kansas City courtesy.

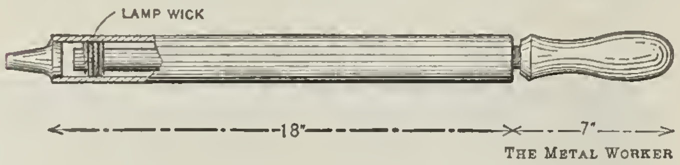
THE TRADE PRESS.

The *personnel* of the scribes changed somewhat at the plumbers' convention, although the exchange of courtesies continued. James M. Heatherton, A. A. Ainsworth and Phil Kearny labored for the *Plumbers' Trade Journal*, H. T. Sheriff, E. Winslow and C. H. Turner for *Domestic Engineering* and H. D. Carter for the *Engineering Review*, H. A. Smith having retired in his favor, and left the quill drivers in charge of Frank K. Chew of *The Metal Worker*. Copies of the respective journals and the daily convention issue of the *Plumbers' Trade Journal* were distributed where the plumbers could readily find them, and were as quickly gathered up by the men and the women alike. The press appreciates this tribute to its merit.

A MOME-MADE FORCE PUMP.

BY D. F. N.

Every plumber located in a residence section frequently has occasion to use a good substantial force pump for removing the stoppages from basins and waste pipes. Such a pump can be made with very little expense, and if a plumber finds himself without one and in strong need of it, it can be quickly made up. All that is required is a piece of 1½-inch tubing used for flush pipes. The tubing should be about 18 inches long, or of such length as can be had from what is left over in fitting up a new closet. This will make the chamber. Then an old thimble from a wash tray can be soldered on the lower end of the chamber. The plunger should be made of a piece of round oak or ash, with a handle at the top extending about 7 inches beyond the end of the chamber. Around the lower end a recess should be cut about ½ inch wide and ⅛ inch deep, to be filled in with twine or lamp wick, to make it fit the chamber tight. If the nose of this is put into a stopped up waste or service pipe and the chamber filled with water a considerable force can be developed to dislodge the stoppage. On the other hand, a very strong suction can also be brought into effect. Such a pump is also very handy for absorbing the water from holes around a drain pipe while making calked joints, or for freeing a main where water collects.



A Home Made Force Pump.

Imperial and Keystone Boilers.

The Utica Heating Company, Utica, N. Y., have issued a price-list of Imperial and Imperial-Keystone steam and hot water heaters, which they manufacture in many sizes. In addition to prices, a table gives dimensions and capacities of the various sizes, all arranged in a way to be of the most value to the dealer. Accompanying the price-list is a four-page folder, illustrating and describing the Imperial sectional steam and hot water boilers, in which the makers claim to have embodied several new features. The water surface is so formed and placed as to utilize in an economical manner the intense heat generated from the products of combustion. The spaces between the overhanging surfaces form a large gas chamber, in which it is stated the gases are thoroughly consumed, and the sections are so arranged as to give a return flue construction. Another point is the provision for positive internal circulation. The boilers have nipple connection, and are constructed on the popular "low down" principle, with no headers at the top or sides. The grate has bars so connected that they form two sections working independently of the other. In case of necessity, the grate bars can easily be taken out by removing one or two of the hand hole covers on the side near the bottom of the boiler; then after drawing out the keys the grate bar will fall down, and can easily be removed through the ash pit door. The circular also calls attention to the Keystone boilers for steam and hot water, which have large fire and grate surfaces with a small amount of fuel surface.

New York City Notes.

Trade in the jobbing and overhauling line still continues quiet for this time of the year, private overhauling being especially slack, while owners of tenements are not doing anything, except necessary repairs, as they are waiting to hear from the Tenement House Board.

⁂

The journeymen plumbers are involved in a dispute with the journeymen steam fitters as to which union should install pneumatic pipes. This is a knotty question to solve, but as plumbers install air or vent pipes, their work would seem to come nearest to pneumatic work.

⁂

The master plumbers in both Queens and Richmond are complaining about unlicensed plumbers being allowed to carry on the business, and have their work passed by the various departments; also that many of these unlicensed plumbers are allowed to use the name of a licensed plumber in getting out permits. The question has been taken up by the Greater New York Association and some relief is soon expected.

⁂

W. H. Spelman & Co. are doing two fine stable jobs for Col. J. F. Corkerill of Speedway fame; one on St. Nicholas avenue near 141st street for his horses and the other at 308 West Sixty-eighth street, to be used principally for automobiles.

⁂

East side building is in the best condition of any section of the city just now. Samuel Greenwald has a tenement at 709 and 711 East Sixth street, another at 31 and 33 Market street, as well as one uptown at 119th street near Madison avenue. Richard Tretler has a tenement at 206 and 208 East Seventeenth street and Jacob Nordinger has three tenements at 419 to 423 East Twenty-fourth street.

⁂

The new Grand Theatre, to be erected at Grand and Chrystie streets, is to be one of the features of that part of the city. The plans for the plumbing are out and many of the plumbers around there are sharpening their pencils to get the job.

The Wellington Mfg. Company, makers of Lamps and Gasoline Torches, after being located at 468 Cherry street, New York, for 17 years, have removed to 18 and 20 Oak street.

FOURTEENTH ANNUAL CONVENTION OF THE NATIONAL ASSOCIATION OF MASTER STEAM AND HOT WATER FITTERS.

(Continued.)

FRIDAY MORNING.

The convention opened in executive session at the Hotel Rudolf and continued until adjournment. The Committee on Grievances sat in Parlor J and held a number of hearings. All the grievances were adjusted before they rose to enter the convention hall with their report.

FRIDAY AFTERNOON.

The convention opened in executive session, but went into open session for the election and installation of the new officers, whose names were given in our report last week. Enoch Rutzler presented his usual long list of motions covering all matters that had not been attended to, thanking the retiring officers and asking that any matter he had overlooked be brought to the attention of the convention for action.

The newly elected president, A. E. Kenrick, in his address of acceptance, alluded to having served on the Credential Committee as chairman since 1890, and assured the members that there would be a new chairman next year. Mr. Kenrick, who is also president of the American Society of Heating and Ventilating Engineers, extended an invitation to all to attend the meeting of that society.

On Saturday a short session was held for the transaction of purely routine business.

"FITTINGS."

A telegram brought T. Howell Johnson down to represent the Thatcher line of steam and hot water heaters, made by the Thatcher Furnace Company, 240 Water street, New York. Mr. Johnson covers a large territory. He found many of the delegates were old acquaintances.

* * *

L. G. McCrum came on from Uniontown, Pa., to say a word for the line of steam and hot water radiators made by the Uniontown Acme Radiator Company.

* * *

Clarence V. Kellogg of the Federal Boiler & Supply Company, 88 Centre street, New York, had Henry Adams as a bodyguard and gave a cordial greeting to Eastern and Western men alike.

* * *

Edward Gurney and W. T. Isaacs of Boston, George Rinkenberger of New York and Fred. Miller of Philadelphia represented the Gurney Heater Mfg. Company and had a Bright Idea for every fitter at the convention.

* * *

W. M. Mackay showed a section of one of the new radiators that the New York Radiator Company of Utica, N. Y., are putting on the market. He also had something to say about the Royal boilers made by the Hart & Crouse Company of Utica, and invited a further investigation of them at his headquarters, 235 Water street, New York.

* * *

Don J. Powers of Chicago and D. E. McCallum of New York, of the Powers Regulator Company, Chicago, got in early and renewed old acquaintances, while securing allegiance to the Powers system of temperature regulation.

* * *

Thomas H. Williams of the A. A. Griffing Iron Company, Jersey City, N. J., left W. M. Cosgrove and A. S. Mappet to do all the work for the Bundy line, for it was his first visit to Atlantic City and he wanted to see the board walk and its attractions.

* * *

Warren Webster and Theodore Webster of the Warren Webster Company, Camden, N. J., helped J. H. Davis in acquainting many interested steam fitters with the Webster system of exhaust steam heating and the Webster specialties. C. P. Vandeveer came down from New York to represent that section, and "Van" fills the bill.

* * *

W. K. Pierce of the Pierce, Butler & Pierce Mfg. Company, Syracuse, N. Y., was too busy enjoying himself to say much about a new catalogue full of new boilers that the house have gotten out.

* * *

The J. L. Mott Iron Works, New York, and the Sunray boilers and radiators had able champions in J. J. Blackmore and Capt. B. N. Hurd.

* * *

Frank C. McLain, New York, had boilers, radiators and specialties to sell and found time for business between the social chats.

* * *

Harry Hellerman called attention to the specialties for steam fitters made by the Penn Engineering Company, Philadelphia.

* * *

Tom Fleming talked "Richmond" as only he can, and the new Richmond boiler and the new Richmond Company of Norwich, Conn., lost no prestige from his discourses.

* * *

The McClave stokers, grates and blowers made by the McClave-Brooks Company of Scranton, Pa., were presented to the attention of the steam fitters by Sanford C. Smith.

* * *

The H. W. Johns-Manville Company were represented by George F. Gilbert of the New York office and Thomas J. S. Nicely from Philadelphia, in whose hands pipe covering got a lift.

* * *

"Use Stillson Wrenches" was the suggestion on a neat souvenir presented by George T. Coppins of the Walworth Mfg. Company of Boston, Mass., to the steam fitters. It was a seal leather pocket with a tablet of paper on the front and a pencil in a socket on one end; first rate for making memoranda. As was anticipated, the ladies appropriated these little conveniences, so Mr. Coppins gave the men a cigar perforator bearing the same suggestion.

* * *

Howard Wright Walton came from 110 Centre street, New York, to push the iron pipe fittings and valves of the Diamond S brand that are supplied by the John Simmonds Company. "Just put it down, and here is a pencil with which to do it, that our house can send you promptly anything a steam fitter ever needs."

* * *

Frank G. English, manager of the Philadelphia office of the J. H. McLain Company of Canton, Ohio, cracked up the better facilities enjoyed in the new quarters at 43 North Seventh street, where he is now located with the College line of steam and hot water heaters.

* * *

The various specialties for steam plants made by the G. M. Davis Regulator Company of Chicago, and particularly their regulators, gained prestige through the explanations of W. R. Moore, manager of the company's New York office at 123 Liberty street.

* * *

S. H. Beard, manager of the heating department of Orr, Painter & Co., Reading, Pa., renewed his acquaintance with the trade and conversed about the boilers made at the Sunshine shop.

* * *

J. J. Wilson, 927 North Forty-eighth street, Philadelphia, was down in the interest of Our Own boilers made by the Novelty Iron Works of Canton, Ohio.

* * *

Mrs. Stewart A. Jellett has a son who is like George Washington in that he fell out with a cherry tree. Unlike George, however, he was pretty severely bruised by the fall, but is doing well.

* * *

W. H. Peterson and W. B. W. Bryan came over from the Philadelphia office to re-enforce W. K. Pierce in doing the honors for the Pierce, Butler & Pierce Mfg.

Company of Syracuse, N. Y. New boilers, new catalogue and old favorites. They showed photographs of the new 900 Series American boilers with 41-inch grates, also photographs of the new one, two, three and four column Lorraine radiator and prime surface indirect radiator.

* * *

J. Dearborn Stiles of Jenkins Bros. telegraphed his congratulations to the convention and regretted his inability to attend.

* * *

The ladies went in one charming line in push chairs to Young's Pier to see the fishermen haul in their net. It was just one of A. B. Jenkins' arrangements for their pleasure. On their return, Charlie Webber had a box of "Huyler's" in each of their rooms; another of the favors of Mr. Jenkins.

* * *

Frank C. Eckfeldt, manager of the Model Heating Company of Philadelphia, and H. Addams enjoyed greeting the steam fitters, many of whom use the Model boilers.

* * *

H. T. Giblin and Mrs. Giblin enjoyed the visit to the shore, even though Mr. Giblin gave considerable time to boiler matters.

* * *

The Vapor Heating Company of York, Pa., and Philadelphia was represented by Thomas Chalfant and E. E. Hershey, who report a growing interest in their fuel saving and efficient system of heating.

* * *

A. B. Marshall of the Boynton Furnace Company, New York, mingled with the crowd in the reception hall and incidentally talked boilers—Boynton boilers.

* * *

J. H. Waters of the National Radiator Company of Johnstown, Pa., was freely welcomed on every hand, and the company's latest radiators received attention.

* * *

M. B. Moore of the Pennington Foundry & Heater Company of Pennington, N. J., gave interesting information about the company's new sizes of boilers, the extension to their plant and their facilities for prompt shipment.

* * *

The Armstrong Stove Company, Baltimore, Md., were represented by W. M. Sardou.

* * *

L. P. Monash made the Monash-Younker Company of Chicago more popular than ever by presenting to the visitors a coin purse. In the purse was a slip saying: "We take great pleasure in presenting this little purse with our compliments and trust that it may never be empty. P. S.—We shall be glad to learn that it reached you in good condition." The name of the company was on the purse in gilt letters, with the suggestion that the Perfected Duplex No. 6 automatic air valves be used on ordinary jobs and the No. 7 vacuum air valves on vacuum systems.

* * *

James A. Trane gave an exhibition of apparatus made by the James A. Trane Vacuum Heating Company, 40 Dearborn street, Chicago, showing the mercury seal, the Allen air valve and the Trane packless radiator valve used on this system of heating. As it was an exhibition in actual operation, it received interested attention from the steam fitters. Get a new catalogue?

* * *

The Norwall Mfg. Company of 40 Dearborn street, Chicago, who make the Allen Automatic air valve, were represented by E. P. Allen, who showed the valve in operation. It has a sealed metal float, needs no adjustment, has a nickel noncorrosive and nonsticking seat, is very sensitive in operation and is made for both low pressure and vacuum systems.

* * *

Robert Hoy was down from Royersford, Pa., in the interests of Floyd Wells & Co. and their line of heating apparatus.

A. J. Wright and Maxwell Gilbert were the rear guard of the Model Heating Company of Philadelphia, coming down on Saturday.

* * *

C. W. Woodward, secretary of the National Committee of the Confederated Supply Associations, was in attendance on the Conference Committee, but had time to renew many old acquaintances.

THE CONFERENCE.

The trade deliberations of Friday at Atlantic City were given additional importance by the conference between the committees representing the plumbers and the supply trade. The National Association of Master Plumbers was represented by President E. D. Hornbrook, Vice-President Charles Polacheck, ex-President P. Tierney and Executive Committeemen T. F. Gaynor, T. J. Young and Fred. Fox, Jr. The National Committee of the Confederated Supply Associations was represented by Frank J. Knox, William H. Haines, J. B. Rahm and G. H. Merkel. Three sittings were held, and the conference lasted until late in the evening.

All the differences existing between the two interests were discussed with the earnestness that their importance warranted and much information was brought to light that will receive due consideration by both bodies. The conference was marked by a manifest desire to get at the bottom facts and to meet fairly all the points raised. Each body seemed desirous of reaching some method of removing the constraint that now exists and of reaching some common ground of agreement. Although no final agreement was reached, the fact that there is no reluctance on the part of either party to meet in conference augurs well for the bringing about of better relations. While nothing in regard to the deliberations was made public, it was ascertained that interesting facts were discovered which, with the generous disposition shown in both associations, seem certain to have a beneficial effect, whether a new agreement is reached or not. Even if this much only is gained, the advantages to be secured by such conferences have been demonstrated and it is to be hoped that harmony will eventually be restored to this branch of trade.

Catalogue of Radiators and Heaters.

The abridged catalogue of radiators and heaters for steam or water sent out by the J. L. Mott Iron Works, 84 to 90 Beekman street, New York City, contains a great deal of information of interest to the heating engineer and contractor. A varied line of goods occupies the pages, the styles and sizes being such as to meet every reasonable requirement. In water heaters the range in capacity is from 100 square feet of radiation to 10,000 square feet in single units, while by arranging a battery of two or more units sufficient capacity for any purpose may be obtained. In steam boilers the sizes range in capacity from 300 square feet to 6000 square feet in single units, and any increased capacity may be secured by connecting two or more.

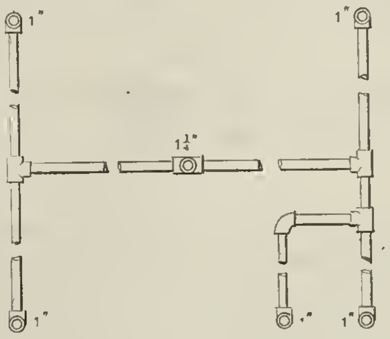
The company call attention to the fact that one of the important features of their boiler construction is the system of movable flue plates, which may be adjusted to suit the chimney draft. The sections of the boilers are separated to allow the fire and heated gas to come into contact with the heating surface of the boilers, the space between sections being 2 inches in the smaller sizes and 3 inches in the larger. The heater and radiator sections are connected by smooth or push nipples, the company pointing out that the difference between the expanded joint and the push nipple joint is that one is pressed out while the other is squeezed in. The company state that their radiator factory at Pittsburgh has been greatly enlarged and its capacity very much increased to meet the demands of their trade.

George R. Estabrook has been given the contract for heating the new block that is being put up in Springfield, Mass., by H. W. Van Allen.

APARTMENT HOUSE WATER SUPPLY.

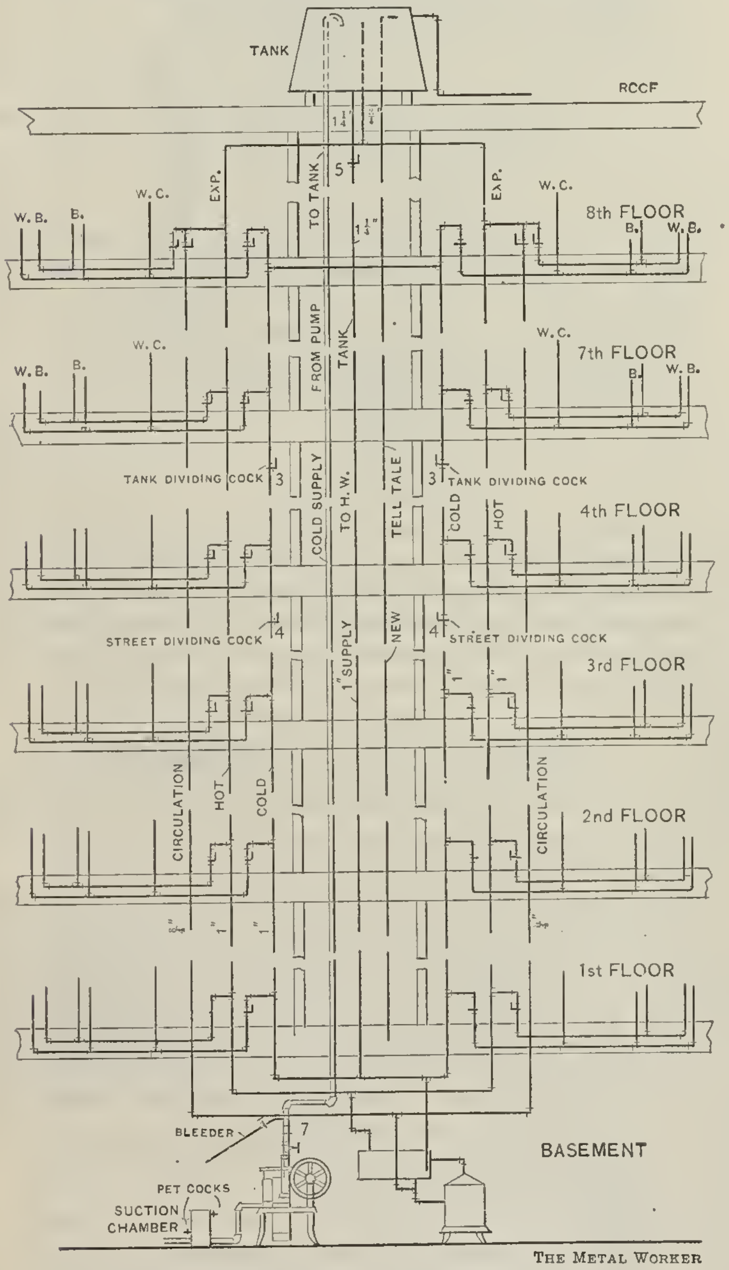
BY D. F. N.

For more than a year past in a large apartment house in the upper part of New York City a great deal of trouble has been experienced with the water supply system of the building, which is eight stories in hight. The water service system was arranged to be supplied from both the street main and a 1500-gallon tank on the roof. From this tank a 1¼-inch falling main dropped to the eighth floor ceiling, at which point it was connected with the distributing lines running across the floor beams and arranged in the shape of the letter H, as shown in Fig. 1, 1-inch falling mains dropping from each branch to supply the kitchens and bathrooms, which were immediately above one another. All these 1-inch falling mains were provided with valves between the fourth and fifth floors, as shown in Fig. 2, which is an elevation showing the piping system. The fixtures on the floors above these valves were supplied with water from the tank, while the fixtures on the lower floors were supplied from the street mains. A 1-inch distributing main heater from the street supply was arranged on the basement ceiling in the same manner as that used on the eighth floor, as shown in Fig. 1, and was connected with the falling mains on the fifth floor, where the valves were located. A 1-inch branch from the street main supply was carried to the hot water storage tank, and a 1-inch branch from the tank supply was connected with the street supply to the hot water storage tank. In order to secure hot water on opening a faucet at any of the fixtures, a circulating pipe was carried back from the hot water riser at the top of the eighth floor and connected with the hot water storage tank, as shown in Fig. 3.



The Metal Worker

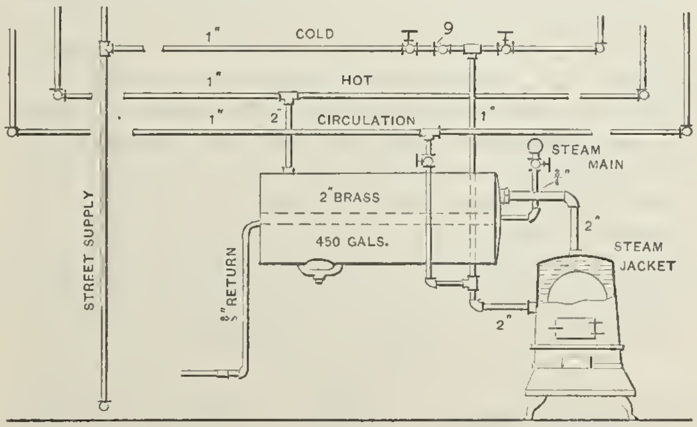
Apartment House Water Supply.—Fig. 1.—Water Supply Header.



The Metal Worker

Fig. 2.—Elevation Showing Piping and Valves.

This describes the condition of the piping as originally arranged. Now to get at the trouble. A plumber who was called in from a nearby shop to examine the piping system from the basement to the roof came across a dip in the hot and cold water supplies on the eighth floor in the boiler rooms, which rose up through the floor in order that the stop cocks connected with them might be accessible. These supplies were turned down again after connecting with the stop cock and pass under the floor, forming a sort of a pocket, or air trap, in the pipe. These pockets he claimed held air or dirt from the tank, as the engineer informed him that the tank was only quarter full while the examination was being made, but that as soon as the tank became filled a small supply of water would flow from the faucets on the eighth floor. The engineer, who was a dusky individual and very "chesty," told the plumber to return to his shop, as he would take care of the rest of the otherwise complete job himself by forcing the obstruction in the pocket in the pipes. After the engineer had put in several hours on several different days, he came to the conclusion that he was not any better off, and to his dismay one of the tenants on the eighth floor made a complaint to the owner that the water furnished by the tank was not pumped regularly, while the other tenants claimed that the pump worked overtime and kept them awake, which doubtless made the owner think of the fuel bill.



The Metal Worker

Fig. 3.—Hot Water Supply Connections.

To overcome the trouble another plumber was called in, who started to gather a little more information and to learn if there was a good head of water on the eighth floor. Some claimed that there was. The next question was whether the tank was filled at night as the result of the street pressure. Some of the tenants answered in the affirmative, but the engineer claimed that the tank was dry. Another alteration which the engineer had made to save the loss of water was the cutting off of the handles on the stop cocks on the fourth floor, so that the tenants could not operate them, and these cocks were left turned off continually. The plumber explained the trouble as being due to realizing no benefit from the street water supply. No benefit was derived from the street water supply on the upper floor during the night. As the piping was arranged it was necessary to work the pump double time, which trouble was still further increased by the location of the check valve, No. 9 in Fig. 3, on the cold water supply to the hot water service tank, which prevented the water from the street main entering this tank.

In order to prove the correctness of his opinion the stop cock on the street supply to the storage tank was shut down over night. The next morning the tank on the roof had an abundance of water and there was plenty of hot water on the eighth floor. On examination of the check valve it was found that it had been strained and would not fall into its seat without slight force, so it had allowed water to leak from the house tank back into the street supply system. The old check valve was removed and a new 1-inch horizontal swing check valve was put in its place. As soon as this bad feature of the system was removed no further trouble was experienced. A ½-inch leader was taken from the pump pipe above the check valve, No. 7, Fig. 2, so that the pipe could be emptied after the tank was filled, thus preventing freezing at the upper end. On the suction line to the house pump one 24 x 10 inch suction chamber was placed, to give the pump a body of water to draw from and to prevent the pump from drawing air into the system through the ball cock on the flush tank in the engineer's water closet. Another alteration was to put in a new telltale pipe from the roof tank to the sink in the basement.

The dusky engineer had a rather original way of telling when the tank was full. His telltale was to pump into the tank until it overflowed on the roof; then when he could see the water running down the leader trap in the basement, from which he removed the cover, he was sure that the tank was full. This gives some idea of the expense borne by those who employ the cheapest plumber, who gets a profit, if possible, whether the owner gets a profitable apparatus or not. A little increase in the first cost would have secured a properly arranged piping system with all the necessary valves, &c., for its proper use and a valve board giving explanation of their use. Men who work too cheaply do not include these conveniences in their job. In many instances, as in this, coal is bought regularly to overcome defects that good business judgment would have avoided by employing a competent contractor at a price that would insure an economical and effective system.

Newark Master Plumbers' Annual Outing.

The time having arrived to make preparations for the annual clambake and outing of the Master Plumbers' Association of Newark, N. J., the Committee of Arrangements, composed of A. Selden Walker, chairman; Ira Budd, F. J. Sturn, William Jacobi, E. A. Bleything and Edward M. Stirling, announce that this year they have again made arrangements with Host Wardell to entertain them at his popular resort, Port au Peck, on Pleasure Bay, on Wednesday, July 23. A special train will leave the New Jersey Central Railroad station, Broad street, Newark, at 9 o'clock sharp, connecting with the Sandy Hook boat leaving Rector street, New York, at 10 o'clock. The party will return from Long Branch on a special train. Tickets can be procured from the committee or from any of the members of the Newark Master Plumbers' Association at the price of $5 each.

The Galva Steam and Hot Water Boiler.

In a neat little folder issued by the Mulford Heater Company, Galva, Ill., attention is called to their latest improved boiler made under the name Galva and adapted for both steam and hot water. We are advised that the company are making their No. 55 boiler with 26-inch or 30-inch grate, as may be desired, although they point out that the 26-inch grate is most suitable for hard coal. The construction of the new Galva is such that the products of combustion after passing up through the water arm ring sections come out in front between the top arm ring and the dome sections, thence down to the diving flues, around the vertical flue damper and then up through the horizontal smoke pipe into the chimney. In this way the products of combustion come into contact with the entire surface of the boiler, thus rendering it a rapid steamer or hot water circulator. The sections have a connection or waterway up through the center of the arms, as well as outside connections, making it a horizontal boiler with perfect circulation within itself. The company use the 4-inch cast iron taper push nipple in connecting the sections of the boiler, which are drawn together by means of a three-quarter stayed rod extending from the top of the dome down through the waterways and screws to stay in the fire pot. By the use of nuts on the top end of the rods the sections are drawn into the taper nipple, thus insuring a joint which the makers state they can fully guarantee never to leak or give out with constant use.

COOLING AN AUDITORIUM BY THE USE OF ICE.*

BY JOHN J. HARRIS.

Two days previous to the commencement exercises in the Scranton High School, June, 1901, the writer was requested by the Board of Directors to devise some means by which the auditorium could be kept at a comfortable temperature during the exercises and not become overheated. Time being short, the only resource left was by the use of ice.

A rack was constructed in the fresh air inlet large enough to hold about 8 tons of ice, with several shelves having slatted bottoms, the frame being made from 2 x 6 inch hemlock studs. At 6 o'clock in the evening the ice was placed in the rack and staggered in such a way that the air was compelled to pass around and between the cakes of ice until discharged by the fan through the flues into the auditorium above, to mingle with the sultry atmosphere; tempering, diffusing and maintaining a temperature that was most invigorating. The bottom or floor of the rack was made from matched pine lumber and lined with No. 28 galvanized iron, and drained by a 2-inch gas pipe. Two fans of the disk type are employed to ventilate this building, one 11 feet diameter, and an 8-foot diameter exhaust fan, located in the attic, the air being forced into the auditorium through a vertical flue at each side of the stage and from above the dressing rooms, foul air making its exit through the registers in the floor, and which are located in the aisles. The construction of this system admits of by-passing all the air intended for the building through the auditorium.

That such an arrangement is necessary can readily be seen from the fact that the seating capacity of this room is 900, but on occasions of this kind about 1400 persons gain admittance, filling every available space to overflowing. The outside temperature was 90 degrees F., while the inside temperature was maintained at 76 degrees F. The humidity was normal, and at no time reached a point of saturation. That it proved satisfactory can best be demonstrated by the fact that the directors were so well pleased that they desire the method to be used for the coming exercises, June, 1902.

TRADE GOLF TOURNAMENT.

The following letter has been sent to the members of the Trade Golf Association, under date of June 9, by the secretary, Chauncy L. Williams:

> Arrangements have been made for the first semiannual golf tournament of the Trade Golf Association. It will take place on June 25, the day following the meeting of the Central Supply Association, at Niagara Falls, N. Y. The officers of the Niagara Falls Golf Club have very kindly placed their grounds at our disposal for the entire day. Arrangements have been made for a luncheon to be served at the club house. I am glad to report the following prizes to be played for at the tournament:
>
> The association challenge cup.
> The United States Radiator Company's cup.
> *Domestic Engineering* cup.
> *Plumbers' Trade Journal* cup.
> *Engineering Review* cup.
> Crane Company: Two silver medals.
> Crane Company: Four bronze medals.
> John Davis Company: Two dozen Haskell balls.
>
> A large attendance is counted on, and every one who is not already a member of the Trade Golf Association who wishes to enter the tournament should send in his name and a check for $3 to the secretary for the year's dues.

---

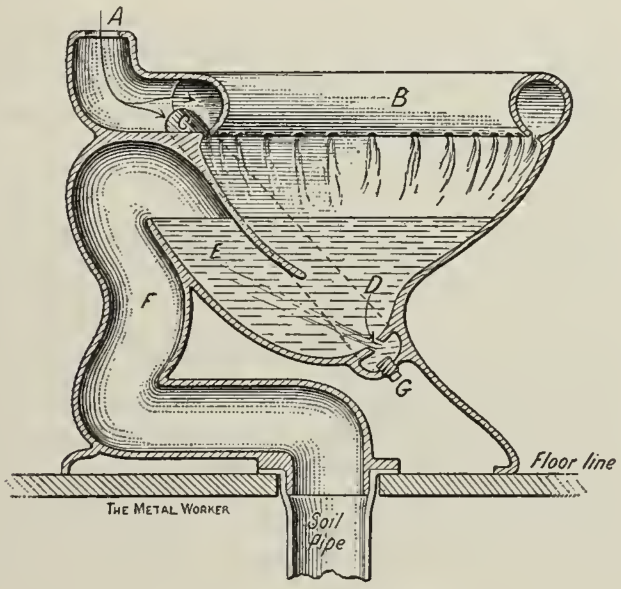
* Paper read at the summer meeting of the American Society of Heating and Ventilating Engineers, at Atlantic City, N. J., June 16, 1902.

JET SIPHON CLOSETS.

BY HELMAR.

Jet siphon closets require but one trap, which is never ventilated directly. The soil pipe may be ventilatated immediately below the closet without interfering with the action of the closet. The trap is always a part of the closet proper. These closets are made in glazed earthen ware and in vitreous china by all the sanitary potters. They are also made of iron, enameled inside, and either porcelain enameled or painted enameled outside. Both the vitreous china and the enameled iron closets are absolutely perfect so far as crazed surface or probability of crazing is concerned. They are guaranteed not to craze.

The potter's work is superior in appearance, more susceptible to ornamentation and tinting than iron, and the clay is easily modeled into any design that permits retaining the essential features of construction. The iron closet is durable. It may be with impunity handled in a manner that would ruin fragile earthen ware. Its rigid nature gives it the advantage of insuring uniformity of dimensions and operation. The value of this sameness can hardly be estimated. When a form of trap that gives the best result has been settled upon, the jet located at the right point, drilled at the right angle and of the right diameter to serve its purpose in the best manner with the least water consistent, every closet made from such patterns and mounted conscientiously may be counted upon to act in the same way.



Jet Siphon Closet.

The illustration given herewith shows the principle of jet siphon closets. The flush rim of the iron closets is not cast integral with the bowl as indicated by the cut. Integral rim jet siphon closets are made only in earthen ware. The screw plug G, shown in the cut, is found only in the iron closets. It stops a hole, through which the jet hole is drilled. The plumber will find the screw plug very convenient at times when a closet gets balky and refuses to siphon. A fissure of iron, core wire or other substance may be found under the jet hole and interfering with the action of the closet. None of these things should be in a closet when it leaves the factory, but they are there sometimes and are usually easy to extract through the plugged hole, if not otherwise.

The strength and character of the jet should be learned by holding the hand over the jet while the closet is discharging, if there is any trouble with its siphonic action. An experienced hand will notice whether the fault is in the flush rim robbing the jet by delivering the water too freely. Many flush rims on both earthen ware and iron closets are "doctored" more or less in the factory before they will siphon properly, and some adjustment is quite usual in order to make the water cleanse all parts of the bowl equally.

It is easy to chip, file or break out on a rim when the water does not come through free enough, and no particular harm is done by doing so unless the iron on iron closets is thus exposed. Then the bowl is sure to become streaked with iron stain. Iron stain on enameled bowls is not always the result of chipping out. The writer has seen closets that were enameled no further than the eye could see under the flush rim. Chips of rubber are used in the factory to plug rims that deliver the water too freely. These plugs sometimes wash out, and as the average plumber does not suspect the employment of any such means to make the closet work in the first place, he is at a loss to know what the real trouble is. The writer carries a piece of rubber in his box and can hammer a slab of it into a flush rim with as good grace as the factory man does, when necessary.

The letters in the sketch refer to the flush pipe inlet, A; flush rim, B; jet channel, C; jet hole, D; water plug of trap, E; outlet leg of trap, F, and screw plug in bottom of jet channel, G. As the traps of these closets are not vented, the water seal is made much deeper than that of an ordinary trap. This extra depth submerges the jet current and utilizes its energy completely in starting the siphonage, which it would not do with equal effect on a shallow seal. The drop leg of the trap is curved reversely and then abruptly forward, or in some equivalent manner, for the purpose of breaking up the discharged water sufficiently to get a piston effect, which produces the strong gulping action that pulls the whole contents out of the bowl at one swoop. The contents of the bowl falling through the drop leg of the trap form the acting long leg of a true natural siphonage, which continues until the bowl supply begins to diminish. The diminishing of the supply and increasing of the amount of air pulled in through the bowl break the siphonage, and the water in the trap and that in the jet channel, flush rim, &c., above the normal level reseals the traps. The action of a jet siphon begins by the energy of the jet water being imparted to that in the trap, causing it to move upward through E at a velocity proportional to the volume which the jet has to act on. In addition to the obstructed course of the drop leg F, its diameter is made less than the ordinary passage to aid the discharge water in filling it properly.

On account of jet siphon closets having to supply both the jet and the flush rim a 1½-inch flush pipe is necessary, and spuds of that size are always supplied by the factory. All low tank closets have 2-inch spuds for flush connection, and many of the low tank jet siphon closets are provided with two jet channels, connecting with a single jet hole, with a view to delivering the water to the jet more freely. The water certainly reaches the jet hole at a much lower velocity on low tank closets than it does on high tank combinations, yet the iron closets, which invariably have but one jet, seem to act perfectly.

The location of the jet hole, its size, the angle at which it is cut and the angle of the surface of the bowl just above the jet hole, all require the skill of long experienced men; but closets are now tested so severely by the makers before they are shipped that it is rarely one finds a closet faulty in jet construction.

Water Works, Drainage and Plumbing in Brazil.

The following report from Eugene Seeger, United States Consul-General at Rio de Janeiro, Brazil, is of interest to the plumbing trade:

The Brazilian coast city of Bahia has about 200,000 inhabitants, who live in 17,000 houses. The water supply available for this population is entirely inadequate. A local company, called "Queimado," have had the contract of furnishing the city with water ever since 1852. They conduct the water from neighboring mountains, and altogether have spent about $1,500,000 for water works, a pipe system, fountains, fire plugs, &c. Long negotiations between the Queimado Company and the city of Bahia for the purpose of adequately increasing the water works came to a conclusion three days ago. The Queimado monopoly is renewed for 45 years, and the company are awarded some valuable franchises and privileges. On the expiration of the contract the city has the option to buy the company's plants, at the valuation of experts. The use of water is made obligatory for each dwelling and the municipality of Bahia regulates the price—$3 a month for the average dwelling for

400 liters (422 quarts) a day and 20 reis (½ cent) per 20 liters (21 quarts) for water furnished at the public fountains and hydrants.

The improvements called for in the Queimado Company's new contract would cost about $600,000. Plans and specifications have been made by experts. Owing to the financial crisis at present prevailing in Brazil the company are unable to obtain the money required to complete the Bahia water system, and for this reason desire to sell their plant and privileges. The price asked is $1,100,000. The earning power of the Bahia water works, when completed in accordance with the new contract, is estimated at $300,000 per year. The agent of the above mentioned company assures me that the person or corporation furnishing the city of Bahia with water under the new contract will also be awarded the contract for establishing a drainage system in the city and for furnishing the houses with sanitary plumbing.

I am well acquainted in Bahia and would advise Americans in this line of business to investigate this proposition. The above named facts and figures I have extracted from the statutes of the company and a report submitted to me at my request. If desired I can easily procure all the necessary details.

Decree in Favor of Peck Brothers & Co.

By a decree of Judge Kohlsatt of the United States Circuit Court of the Northern District of Illinois, issued on June 4, the Peck Brothers & Co. of New Haven, Conn., are adjudged the sole, absolute and exclusive right to use the name of "Peck Brothers & Co.," or "Peck Brothers Company," or "Peck Brothers," or the name of "Peck" in connection with the business which they are carrying on in the manufacture and sale of plumbing goods, gas and steam fitting machinery, material and supplies and brass and iron goods, as against the Peck Brothers Company of Chicago, who have carried on a similar business under that style for the last six years.

This decision is based upon a mandate of the United States Circuit Court of Appeals, whereby a former decree in the case, on July 8, 1901, was reversed. The court further ordered that the defendant corporation, Peck Brothers & Co., and Oliver D. Peck, James H. Johnson, William A. Ratcliffe and Albert D. Sanders, as their officers and directors, are perpetually enjoined and restrained from using the name of Peck Brothers & Co., or Peck Brothers Company, or Peck Brothers, or "Peck," or names substantially identical therewith, in connection with the business of the manufacture, purchase and sale of plumbing goods, steam fitting goods and brass and iron goods, or from stamping or marking such names upon any goods manufactured by them, or from selling by themselves or their agents any goods manufactured by them having stamped thereon any of the names aforesaid.

It was, however, further ordered by the court that nothing in the decree should be construed as enjoining or preventing the defendant, Oliver D. Peck, from using his own name as an individual in the conduct of his business. The court further ordered that the cause be referred to William M. Booth, a Master in Chancery of the court, to take an account of the gains and profits, if any, which had been made and received by the defendant corporation, Peck Brothers Company, by reason of using this name in connection with their business. The report of such gains and profits is to be made by the master at the earliest possible date.

◆

The J. H. McLain Company, Canton, Ohio, have just issued a neatly printed price-list of 64 pages, relating to their Hot Water and Steam Heaters, Radiators, Supplies, &c. Special attention is directed to the Columbia Hot Water and Lehigh Steam Boilers, which are illustrated by means of general and broken views, the latter indicating the internal construction. The company carry a large stock of Seneca Radiators in two and three column for steam or water, and in various hights to meet different requirements. Interesting features of the publication are tables giving the area of circles and pipe data: also table of rates for hot water heating, and a great deal of other information which the heating engineer and contractor will find of value.

Heating and Plumbing Notes.

W. P. Longworth & Co. of Richmond, Va., have been awarded the contract for the steam heating of the new Henry Clay Hotel, at Ashland, Va.

At a recent meeting of the West Middle School District of Hartford, Conn., a resolution was adopted appropriating $20,000 for the installation of a central steam heating plant.

The Standard Heating & Engineering Company, Lancaster, Pa., H. H. Lindemuth, managing engineer, have purchased of W. H. Clark of Orr, Painter & Co., Reading, Pa., two No. 411 Monarch Sunshine Boilers for heating the new building of the Altoona Trust Company, in which there is 7000 feet of radiation, made by the National Radiator Company of Johnstown, Pa. They also have the contracts for the Riddelmoser Building and the residence of George B. Hyde at Baltimore.

The Plumbers' and Tinsmiths' Association of Middletown, N. Y., held their annual meeting on Wednesday, June 11, when the following officers were elected: President, William Heake; vice-president, Arthur Conkling; treasurer, William Myers; secretary, C. E. Decker; trustees: Arthur Conkling, Harry Foss, George Yetto and Harry Stedman.

An order dissolving the corporation of Hardwicke & Co., steam fitters and plumbers, Niagara Falls, N. Y., was made by Justice Childs of the Supreme Court. Postmaster Francis H. Salt of Niagara Falls was named as permanent receiver of the company.

At a meeting of the Master Plumbers' Association of Newark, N. J., held June 14, the following delegates were elected to attend the convention of the National Association at Atlantic City: Ira Budd, F. J. Sturn, William Jacobi, E. A. Bleything, C. P. Zimmerman, Robert Zettler, A. Seldon Walker, Robert Berla, Ralph Schmidt, William Demars, George Crawley and S. J. Wilson.

Hosie Brothers, Franklin, Mass., have been awarded the contract for the plumbing and steam fitting work on the almshouse building in that town.

The Board of Managers of the St. Joseph Catholic Club, Troy, N. Y., have awarded the plumbing contract for new baths for their clubhouse to Delehanty & Murphy of that town. The total cost of the baths, comprising nine showers and one tub, will be over $2000.

The Eastern Clay Goods Company, with yards and storehouses at East Cambridge, Mass., have opened a Boston office at 65 Oliver street, under charge of C. S. Robbins, treasurer and general manager. They are general sales agents for the following concerns: Robinson Brothers & Co., the Crown Fire Clay Company, the Royal Sewer Pipe & Fire Brick Company, the Lock Haven Sewer Pipe Company and the Robinson-Merrill Pottery Company, all of Akron, Ohio.

Lyman P. Haviland, chairman of the Building Committee of the New York Agricultural Experiment Station, Geneva, N. Y., will receive bids until June 28 for a heating plant at the Experiment Station.

The annual meeting of the Massachusetts Association of Plumbing Inspectors was held in Worcester, Mass., on Saturday, June 14. It was attended by about 20 of these officials from different parts of the State. The party were entertained at dinner before the business meeting. The association was organized in Worcester seven years ago, and its annual meetings are always held in that city, the semiannual meetings being held in Boston. The officers of the association are: President, Morris T. Coleman, Newton; secretary, John J. Bresnahan, Fitchburg; treasurer, John F. Hurley, Worcester.

Rourke Brothers of West Haven, Conn., have been awarded the contract for the steam fitting, air piping and plumbing in the new Lion Brewery, at Allington, Conn.

Committees representing the Journeymen's Union and the Master Plumbers' Association of Bridgeport, Conn., met on Saturday and ratified the settlement of the plumbers' strike on the lines suggested by the Arbitration Committee. While the settlement is in the nature of a compromise, it is regarded as favorable to the journeymen, who gained their demand for a minimum wage scale of $3 per day of eight hours.

A special committee on plumbing of the Board of Aldermen of Woonsocket, R. I., has been appointed to thoroughly investigate the subject and draw up a set of regulations for the installation and inspection of plumbing in that city.

The plumbers' strike at Montgomery, Ala., was settled on Saturday, and the men returned to work at their old wages of $4 a day, with nine-hour working day.

The Board of Health of Holyoke, Mass., is going after the unlicensed plumbers in that city, two of whom have recently been fined $5 in the police court for doing work without a license.

Ross & Seabury, Boston, Mass., have been awarded the contract for the installation of electric, steam heating and ventilating plants in the new Solomon Sanitarium, at Attleboro, Mass.

A circular which is being sent out by the Lombard Iron Works & Supply Company of Augusta, Ga., calls attention to the leading specialties which they manufacture, among them being High Pressure Boilers.

The J. L. Mott Iron Works of New York City are preparing plans for a new plant, to be located at Trenton, N. J.

C. Parke Cummings of the Central Machine Works, Lancaster, Pa., is using two No. 412 Monarch Sunshine Boilers made by Orr, Painter & Co. of Reading, Pa., and the Broomell vapor heating system, with 8000 feet of radiation, in the new Wheatland Hotel, at Lancaster, Pa.

H. D. Fitch, Bowling Green, Ky., has applied for a franchise to establish a plant and lay pipes for furnishing steam heat to business houses and residences in Paducah, Ky.

The Quaker Mfg. Company have begun work on their new plant at Chicago Heights, Ill. The plant will include a one-story foundry building, 70 x 150 feet; a two-story erecting and shipping building, 50 x 200 feet, and a one-story warehouse, 50 x 150 feet. In addition there will be an engine and boiler house and a pattern building. The company will manufacture Hot Air Furnaces and a line of Combination Hot Air and Hot Water Heaters.

About July 1 the Royal Heating Company, San Francisco, Cal.. will remove to much larger quarters and concentrate their entire business at 617 Mission street, in the center of the wholesale district in their line. In their new quarters the company will have a greatly increased floor space, with an abundance of light and freight and passenger elevators. This change will enable them to better take care of their rapidly increasing business. J. G. Sorgen is president and general manager, and A. B. Sorgen secretary and treasurer of the company. The concern make a specialty of heating and ventilating residences and public buildings.

A plant for the manufacture of Acetylene Gas Apparatus is to be located at Wapakoneta, Ohio. A site of 15 acres and a bonus of $12,000 have been given to the new company.

The City Council of Alexandria, Ind., have awarded a franchise to S. G. Philips for the construction and operation of a city hot water heating plant. The franchise extends over 30 years, and the Council stipulate that the city may purchase the plant at any time after two years, and that heating service shall be furnished free of cost to the city buildings.

The plumbers' strike at Sharon, Pa., which lasted for two months, has been settled. The terms of settlement are $3.50 for an eight-hour day, with time and a half for overwork and double time for Sundays. The 19 rules which had been submitted were suspended, and it was agreed to start on a new basis. Therefore no agreement was signed and the men gained one hour. In other words, they now work eight hours instead of nine for the same compensation. In all other respects the status of the case is the same as before.

The School Directors of Sayre, Pa., have awarded to H. R. Talmadge of that town the contract for furnishing the heating apparatus for the Elmer Avenue School building at his bid of $1058.

The directors of the Young Men's Christian Association at Allentown, Pa., have awarded to Hersh & Brother of that city the contract to put in a steam heating system in the Y. M. C. A. Building.

The contract for the steam heating and piping of the North Chestnut Street Grammar School, Springfield, Mass., has been awarded to the Selvey-Wyckoff Company at their bid of $3350.

George Paroschol of Athens, Greece, who was graduated this month from the Massachusetts Institute of Technology, has been enrolled in the American School of Correspondence of Boston. Mr. Paroschol expects to complete the school's heating, ventilating and plumbing course in the fall, when he will return to Greece to accept a Government position, in which he will supervise the installation of heating and ventilating systems.

The difficulty between the Journeymen Plumbers' Union and the Master Plumbers' Association of Portland, Ore., has been settled, and the journeymen have returned to work. Slight concessions were made on both sides. The men have agreed to work for none but master plumbers.

The Byrne-Powers Plumbing Company of St. Joseph, Mo., have been awarded the contract for plumbing the City Hall in that city.

The contract for furnishing a new heating and ventilating apparatus for the Hoosac Street School building, Adams, Mass., has been awarded to P. T. Connors of that city. Mr. Connors will use Royal Heaters.

John P. Smith has a contract to install a steam heating apparatus in the Home for the Aged, York road and Hunting Park avenue, Philadelphia, at a cost of $1395.

The plumbers' strike at Uniontown, Pa., has been settled by the employers agreeing to grant an eight-hour day at $3.50 per day wages.

Barlow Brothers Company have secured the contract for plumbing the freight house of the N. Y., N. H. & H. R. R. Company, at Waterbury, Conn. They are also doing the plumbing and heating in the residence which is being erected in that city by E. L. Frisbie.

Frank I. Lessard & Co., Springfield, Mass., have just completed the plumbing in the Presbyterian Church at Thompsonville. They are now doing the plumbing, heating and gas fitting in the Ducharme Block on Round Hill, and the McKinney Block on Main street, and are engaged upon a number of other contracts aggregating a considerable amount.

The Master Plumbers' Association of Cleveland, Ohio, at a meeting held last week, adopted a resolution expressing the sentiment of the association as strongly favoring the employment of none but local architects on the Supervisory Commission for the grouping of public buildings. This expression has been presented by a special committee to the Cleveland City Council, the Board of Control, the Chamber of Commerce and the Builders' Exchange, as well as to the Mayor of the city and the Governor of the State.

All the master plumbers of Birmingham, Ala., last week took off their coats and set to work on a job to help Ben F. Barbour, a brother master plumber, to complete a piece of work in accordance with a contract. A strike of the local journeymen plumbers threatened to cause considerable loss to Mr. Barbour.

The master plumbers and tinners of Morristown, N. J., have granted their employees an eight-hour day, beginning with Monday, June 16.

Sealed proposals for furnishing and installing a plumbing and drainage system in a new brick fire station on Monet Road, West Newton, Mass., will be received until June 23, at the office of the Public Buildings Commissioner, West Newton, Mass.

The City Council of Jacksonville, Ill., has granted a franchise to the Steam Heating, Electric Power & Light Company, to construct a large central plant for the purpose of heating stores by hot water.

The Master Plumbers' Association of South Bend, Ind., are making preliminary arrangements for the annual meeting of the Indiana State Association of Master Plumbers, to be held in that city next March. David A. Westbury is the chairman of the Committee on Arrangements.

The fact that New Orleans, La., is shortly to undertake the great work of sewering the city will immensely increase the importance of the plumbing trade in that city. Both the master plumbers and journeymen plumbers of New Orleans believe that, in anticipation of the expansion of plumbing, legal provision should be taken to prevent incompetent men from engaging in the trade whose inefficient work would tend to the detriment not only of the plumbing trade, but also of the public health. A meeting was held recently in New Orleans, when a bill was prepared for presentation to the city authorities providing for a board composed of representatives of the city Board of Health, the City Engineer, three master plumbers and two journeymen plumbers, to be appointed by the Mayor, whose business it will be to supervise all plumbing work and to examine applicants for licenses as plumbers.

The Union Light & Heat Company, Cincinnati, Ohio, are now in new quarters at 106 to 108 East Second street, where they occupy the entire five floors of a 30 x 100 foot building in the manufacture of the Benedict Acetylene Gas Machine and the Graf Improved Acetylene Gas Range and Hot Plates. The company have just issued a neat little booklet referring to their specialties which they will be pleased to send the trade upon application.

The Field Automatic Valve & Faucet Company, 162 Dorrance street, Providence, R. I., are sending to the trade a six-page folder devoted to the Perfection Low Down Knurled Pattern Nickel Plated Basin Cock, which is shown in different styles, and is adapted for use in all classes of buildings, mills and factories, as well as the most elegant private residences. It is claimed that these Valves will not water hammer, have no stuffing boxes or steam packing and work equally well for cold and hot water. Another point is that they will open when the water is shut off from a building to allow the water to drip from the pipes and thus prevent freezing. Another circular shows the company's Self Acting Bail Cock.

New Firms and Changes.

Edward Saehrig has bought a half interest in the plumbing, gas and steam fitting and tinning business of Samuel Haeslip, at Saratoga, N. Y.

William Hillman and H. W. Hagen are starting in the plumbing and heating business at Sydney, Cape Breton.

The Sieben Mfg. & Supply Company of Kansas City, Mo., of which the late Dent Yates was a member, have been reorganized. The capital stock has been increased to $50,000, and the firm of Sieben & Conity have combined with the new concern. Charles E. Davis is president, Henry Sieben vice-president and Homer E. Davis secretary and treasurer. These officers, together with D. O. Smart and B. Howard Smith, constitute the Board of Directors. The company will manufacture Plumbers' Supplies.

The Scoville Plumbing & Heating Company of Denver, Col., have been incorporated with a capital stock of $1000 by Henry Scoville, Almon E. Hull and Louis M. Hovey.

Schwar & Pentz of Boston have opened a branch plumbing shop at Newton, Mass.

The National Electric Heating Company, with principal office at 211 Market street, Camden, N. J., have been incorporated with a capital of $250,000 by Robert Watt, Paul Hafter and John O. Wilson, to carry on an electric heating business.

Carney Brothers Company of Utica, N. Y., have been incorporated with a capital stock of $6000 to carry on a plumbing business. The directors are John F. Carney, E. Carney, Henry C. Brunett and Herman Petersen, all of Utica.

William H. Deisseroth, who for several years has conducted a plumbing business at 259 Broadway, Newburgh, N. Y., has disposed of his business and accepted a position with the Central Hudson Steamboat Company.

The Jacksonville Hot Water & Steam Heating Company of Jacksonville, Ill., have been incorporated with a capital stock of $50,000 to operate a heating plant. The incorporators are John Cherry, Jr., John Cherry, Sr., and Joseph Brown.

The Gardner-Woolner Electric Heater Company of Chicago have been incorporated with a capital stock of $100,000 by Fred. B. Waring, Charles A. Woolner and Frank D. Thomason.

The Simpson Mfg. Company, with principal office at Roselle, N. J., have been incorporated with a capital of $100,000 to manufacture Sanitary Appliances. The incorporators are James Simpson, Daniel Schwarz and Otto Platzer.

F. Folsom will open a plumbing shop at 6240 Ashland avenue, West Englewood, Chicago.

The Bradlee & Chatman Company, Boston, Mass., have been incorporated with a capital stock of $30,000 to manufacture Heating Apparatus. John E. Chatman is president of the company, and Charles W. Bradlee, treasurer.

The Kirby-Williams Company have been organized at Pittsburgh, and are dealers in Machine Pipe, Pipe Cutting, Threading and Bending; also second-hand Pipe and Machinery. The plant of the concern is located at 216 South Main street, West End, and the firm are composed of John T. Kirby and John Williams.

Stove and Hardware Dealers.

B. W. Crone has recently purchased the Hardware, Stove and Tin business of W. J. Ohlhleser, Juniata, Neb., and is continuing at the old stand.

R. M. Bower, in the Hardware business at Whigham, Ga., requests catalogues and price-lists concerning Hardware and related lines.

Meyer & Soffel, Hardware, Stove and Agricultural Implement merchants, Maywood, Ill., have been succeeded by Frank Meyer.

Reed & Wheeless have sold their Hardware, Stove, Implement and Sporting Goods business in Hopkinton, Iowa, to G. W. Collins.

Wm. H. Munson of North Woodbury, Conn., has disposed of his Hardware, Stove, plumbing and tinning business to Strong & Munsell.

D. D. Nelson, in the Hardware, Stove and plumbing business in Granville, N. Y., has been succeeded by D. D. Nelson & Co.

D. B. Bradshaw, in the Hardware, Stove, Farm Implement and furniture business in Terral, Ind. Ter., has been succeeded by Bradshaw & Lewis.

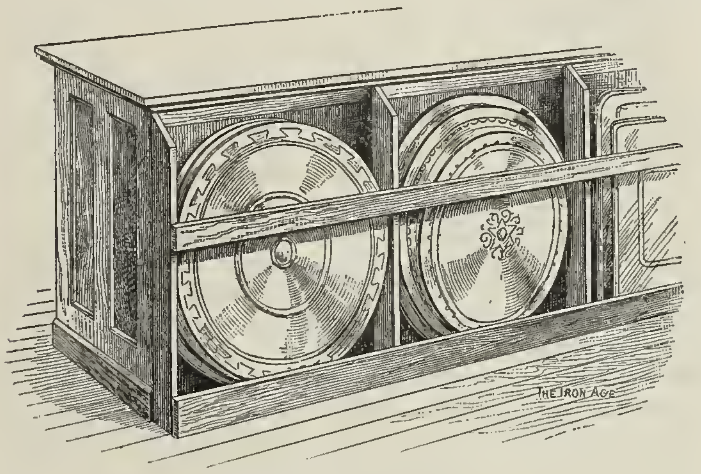
M. S. Mathews, 323 Boston Block, Minneapolis, Minn., has been appointed secretary of the Minnesota Retail Hardware Association, succeeding the late Thomas McCracken. Mr. Mathews has also been chosen secretary of the Minnesota Retail Hardware Dealers' Mutual Fire Insurance Company.

F. Kieferle has been succeeded in the Hardware business in Marion, Kan., by Kieferle Bros., who will be pleased to receive catalogues pertaining to Hardware, Stoves and Tinware, Agricultural Implements and Sporting Goods.

Goodell Company, Antrim, N. H., with New York office at 10 Warren street, issue an illustrated pamphlet describing a number of Apple, Potato and Vegetable Parers, also a Cherry Stoner. In 1864, the pamphlet states, Apple Paring Machines were first made by the president of this company.

Keeping Stove Boards.

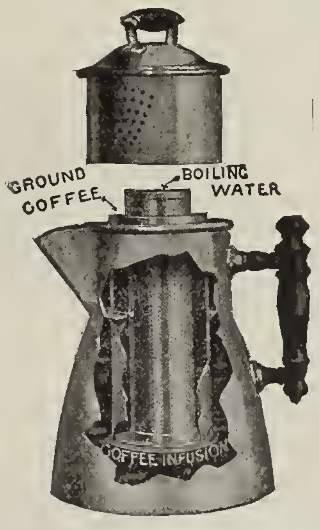
The method of keeping Stove Boards in use in the store of James Wilson, Stamford, Conn., is clearly shown in the accompanying illustration. As will be seen, Boards 3½ inches wide are fastened at intervals to the front of a counter. Across these are fastened two strips, one at the base and the other a little more than half way up. The Stove Boards are put in the spaces thus made, where they are out of the way and at the same time of easy access and in plain view of customers.



Keeping Stove Boards.

Ideal Percolating Coffee Pot.

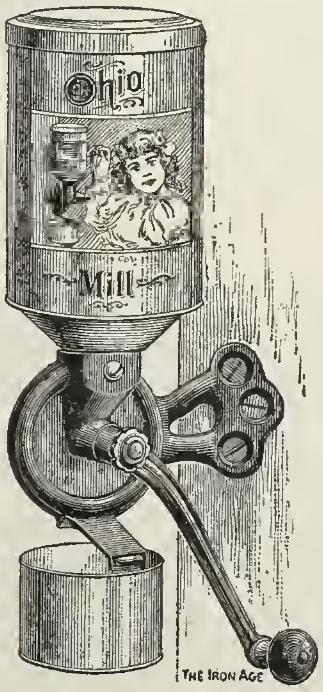
The Aluminum Cooking Utensil Company, Pittsburgh, Pa., are now manufacturing and placing on the market the Ideal percolating coffee pot, of which we present an illustration. This pot is made of aluminum, and its construction and points of excellence are briefly described as follows: There is no strainer in the spout, such as is found in the ordinary coffee pot and which is difficult to keep clean. The cover also has no hinge to get out of order. The cover of the Ideal coffee pot is so constructed and is so utilized that a strainer is provided or a steam tight pot is secured, as desired. The spout and body of the pot are formed of one continuous piece of metal without joint, seam or solder, and are therefore free from danger of leaking. The percolator, the construction of which is shown in the broken view given in the illustration, is simple in construction. The tubes are all made of very finely perforated sheet aluminum. The percolator is suspended within the pot, and the coffee, which must be finely ground, is placed in the space between the tubes. Boiling water is then poured in the tube which projects above the pot for this purpose. The bottom of the upper tube is closed without perforation and that of the inner tube is open. The pot is made both with and without the percolator, as desired. It is steam tight and the ground coffee is arranged between the two tubes in a uniform cylinder zone ½ inch thick. In this way, it is claimed, the boiling water, in percolating through the coffee, comes into immediate contact with every particle of it in the shortest time possible. The same pot may also be used for tea. The makers claim that by the use of aluminum in the manufacture of the pot cleanliness, purity, lightness and durability are secured.



Ideal Percolating Coffee Pot.

The Ohio Coffee Mill.

The Sun Mfg. Company, Greenfield, Ohio, have added to their line the coffee mill herewith illustrated. It has a decorated tin hopper holding 1 pound, and a tin cup. The castings are made in two pieces, combining, it is remarked, simplicity, strength and lightness. The burrs are referred to as being constructed on an entirely new principle, in that they do not come in contact with each other, but are adjusted to each other with a flat surface and operate like a pair of shears, shearing the coffee in a clear, clean cut. The coffee is fed in uniform quantity into the burrs, is sheared in fine lumps, drops to the bottom of the V in the burrs and into the cup. It is stated that the coffee is not crushed and rubbed, and that the burrs constantly clear themselves. It is pointed out that the draft is reduced 50 per cent. by the burrs not touching each other, and that the uniformity of the feed insures a uniform draft.



The Ohio Coffee Mill.

The Reed Mfg. Company.

We have received from the Reed Mfg. Company, Newark, N. Y., copies of two catalogues, the first of which covers their line of Reed's patent anti-rust tinware. The second catalogue is devoted to Reed's extra heavy hand made pieced tinware, copper boilers, copper and nickel plated goods and galvanized ware. The two catalogues are gotten up in similar style on fine paper and illustrated with excellent engravings, each being of about 100 pages. A view of the company's factory at Newark is presented at the beginning of each catalogue. Reed's patent antirust tinware is shown in the first publication in a variety of styles, covering nearly all the ordinary lines of tinware, including plain and strainer pails, covered pails, creamery pails, dippers, cups, measures, milk strainers, wash basins, pudding pans, milk pans, sauce pans, preserving kettles, pie plates, dish pans, sprinklers, tea and coffee pots, wash boilers, oil cans and a handsome line of toilet ware, together with Reed's polished steel self basting roasters.

A similar line of goods made of heavy hand made pieced tinware are included in the second catalogue, also a line of stamped tinware and a handsome variety of nickel plated and copper ware, including tea kettles, coffee pots, dippers, cuspidors, galvanized pails, dish pans, wash basins, oil cans, grain measures, toilet ware and sprinklers, occupy the following pages. The last pages are devoted to the O. H. one piece stove pipe elbows, the Misses Lisk's improved patent cake tins and measuring cups, self cleaning graters and the O. K. stove pipe thimbles.

Cold Working Sheet Metal In Dies.*

BY J. D. RIGGS.

IN TWO PARTS. PART II.

In drawing and reducing bright steel I have found it possible to draw to 9 inches diameter, anneal and reduce to 6 inches diameter at one operation; but this is rather too much; from 8 to 6 inches is much better. When the side of a cup is to be used as a seamless band without flange, either inside or out, the tool shown in Fig. 17 will be of service in a lathe.

It is often necessary to turn a flange around a hole, but this is found a very different problem from turning an outer edge. In turning out a flange ¼ inch high around a 2-inch hole in IXX tin so many pieces were spoiled by cracking at the edge that we made new dies and drew the stock in before cutting the hole. These holes were punched 1⅜ inches when turning them out to form a ¼-inch edge around a 2-inch hole. Another case of this kind was done by hand tools instead of in a press, and proved entirely successful. In Fig. 18 R represents a section of a steel bicycle wheel rim through the hole for the valve tube. The ⅜-inch valve tube required a 13-32-inch finished hole. The rim was first drilled to one-third of the finished size. The hand punch, made to the finished size of the hole with the pilot *n* 1-32 inch larger than the drilled size, was driven through with six or eight blows of a hand hammer, while the " hold on " *q*, weighing some 3 pounds, was held up with a light spring. Block, *o*, with ½-inch hole, *p*, was held in a bench vise. The material was No. 16 gauge, and reduced to about half this thickness without cracking. The rims were stiffer through this reenforced hole than elsewhere.

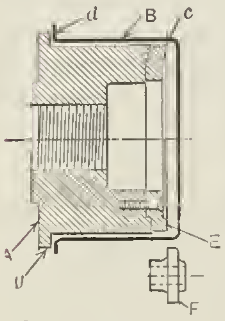


Fig. 17.

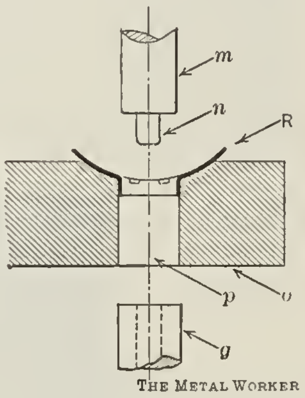

Fig. 18.

Some work with straight sides and sharp angles may be cut out in dies such as shown in Fig. 19, which consists of four hardened steel pieces attached to a cast iron base. I have not found this to materially reduce the cost of the dies, but the straight sides of both punch and die may be ground true after hardening and in this way improve the work. The pawl and ratchet may be used in various forms for spacing holes or notches. Figs. 20 and 21 show the construction of a horn die used to punch holes in the side of a cylinder. In this case a notch in the edge of the work engaged the pin *e;* the operator turned to the left until the pawl dropped into a notch and then held to the right while punching a hole. Ratchets are used for notching armature stampings where the ratchet is somewhat smaller in diameter than the work and lies horizontal.

Work on the side of a cylinder is commonly done in a horn press, where a horn similar to *c*, Fig. 20, is attached directly to the back of the press.

The particular construction to adopt in making a die will often depend on shop conditions and tools available. The die shown in Fig. 2 contains the hardened ring *m* and the soft tool steel ring *k*. These rings should be made weldless, and *k* may be either welded or brazed to the machine steel punch body *i*, while *m* should be ground on the extreme inside and outside and on the bottom. The ring *n* should be tool steel, and may be welded by an expert smith, but if the smith is doubtful it had better be forged without welding. When it is important to maintain a standard diameter of work a hardened ring, *l*, or, in case of lettering or ornaments, a disk, is used. In single acting press dies it is the die center, *l*, rather than the interior of the punch, *k*, which determines the diameter of the work. It is well to have the interior of the punch a close fit in work, such as can ends, where the edge is all drawn in, but in cases where a radial edge is left, such as shown in Fig. 7, the punch may be comparatively loose. In double acting press dies the inner punch determines the size and often the shape also of the work, while the die may not fit the work all the way but only at the upper corner.

In regard to foundry patterns for small die parts I have found it a matter of economy to have on hand six or eight sizes of bottom plate patterns, *u*, Fig. 3, well made and varnished, with core prints and a core box to core the slots *z* straight sided and to leave a spot, *w*, to finish. To this base pattern " hurry up " pieces are added as needed for individual dies, the same base pattern being used for die Fig. 2 and die Fig. 3, with different additions, and in case of Fig. 3 a central core. Die castings made from such patterns need not be machined all over.

In dies for double acting presses, which cut the blank as well as form it, a hardened and ground ring, *e*, Fig. 15, is used with a steel ring, *c*, welded to the wrought iron plate *b;* these do the cutting, and when the corner *d* of ring *c* becomes dull it is upset by hammering on the lower face, which must then be turned up again to fit the hardened ring *e*. The inside plunger *a*, Fig. 15, may be made of machine steel, for working tin plate or brass; but for working steel it had better be either hardened steel or cast iron. In this particular die a little variation in the diameter of the inner punch *a* is of no consequence; if the work had been blanked out first in another die, or cut into disks in the circle shears, then this die might have been made entirely of cast iron, and would consist of only three pieces similar to the die shown in Fig. 16, with perhaps a chilled surface, *g*.

The die shown in Fig. 16 was made of cast iron, except the plate *l*, which was of machine steel. The outer punch *i* and the die *k* were cast at a car wheel foundry, and the working faces *j* and *s* were chilled very hard. This die worked well on tin plate. Another die, made of cast iron and chilled in the same way, working on black steel which had been annealed after the first operation and was rough, gave much less trouble than previous dies on the same work with hardened steel rings on the faces, although either had to be ground true and polished occasionally.

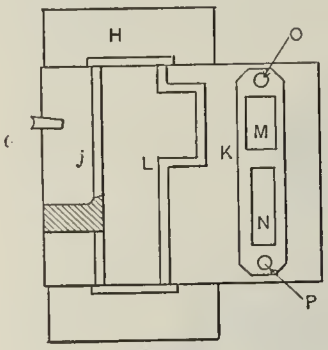

Fig. 19.

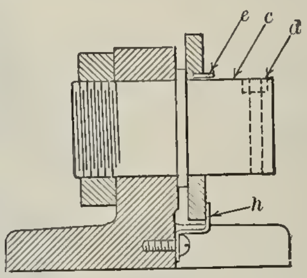

Fig. 20.

In drawing deep work, or in cases where the metal is severely worked, it is customary to anneal the work one or more times during the process, but tin plate is ruined by annealing; hence such work is drawn and annealed before plating, or, if some stiffness is required in the finished piece, one drawing operation may be performed after annealing and plating.

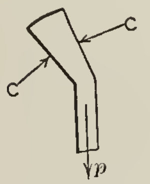
In cutting and forming bright steel it is customary to use oil as a lubricant and apply it in spots over the sheets before they are cut up into strips. In working tin plate the coating of tin, together with the thin film of oil left on it from tinning, are ordinarily sufficient lubrication; but in drawing large pieces in a double acting press a stick of paraffin wax may be passed once around near the edge of the blank. In working black steel plate which is to be tinned afterward oil is objected to by the tin house foreman as making him extra work, and an alkaline solution which will clean in an acid pickle is used, either soda water or a soapy water. One concern buys a soap made from fish oil, puts about a pound of this in a gallon of water and applies with a sponge to each side of the blank.

---

* Presented at the Boston meeting (May, 1902) of the American Society of Mechanical Engineers.

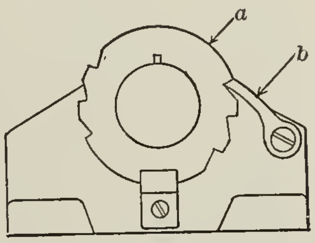
A day's work for a boy or a girl and a press will depend upon the shape in which the stock comes to the press as well as the speed of the press and the dexterity of the operator. With a die such as shown in Fig. 2, for cutting and forming ends 4 inches in diameter or smaller, from tin plate cut into strips 20 inches long and wide enough for two rows of ends, an experienced operator will produce from 8000 to 10,000 pieces in ten hours. With a similar die for making ferrules for wood handles out of the scrap thrown into a pile a boy will probably get 2000 ferules in ten hours. A press with automatic feed, cutting bicycle chain links, will produce about 90 pieces a minute, working steel in long strips rolled up. The gang die cutting and forming can ends from sheet, shown in Fig. 4, cut about 11 sheets per minute, making two strokes to a sheet, while the other gang die described cut about 20 sheets a minute, but from this some time is to be deducted for handling stock, &c. A large drawing press on work from 10 to 20 inches in diameter and from 2 to 6 inches deep will produce from 3000 to 5000 pieces in ten hours, but if such work does not "nest" well together it may occupy so much room as to retard the work.

The length of time that a die may be used at one sharpening will depend upon conditions and may vary from half a day to two months. The material of the punch and die, the material worked, the angle of the cutting edges, or the complement of *a*, Fig. 2, and the shear of the die, are the principal factors in the life of the cutting edge. I have seen dies used for ten weeks on tin plate at one sharpening. Fifty hours is about the average time in an electrical factory for dies cutting No. 26 gauge soft steel. Dies cutting bright soft steel for builders' hardware, from 1-16 to ⅛ inch thick, with both punch and die hardened, ran from two to four days at one grinding. Dies with square corners for cutting edges. and no shear on either punch or die, ran about half as long as dies cutting the same pieces from the same stock with a cutting edge of about 82 degrees and with shear. The high and low points in the upper edge of *m*, Fig. 3, may be about 1-16 inch difference in hight, and the angle *a*, Fig. 2, from 5 to 10 degrees.



THE METAL WORKER

Fig. 21.



THE METAL WORKER

Fig. 22.

The selection of a suitable press deserves more attention than is something given to it, too small a press being liable to spring and injure the dies, while too large a press is slow and clumsy. Presses for cutting only may generally be much lighter than when used for cutting and forming combined. In a stamping factory the expense may often be greater for dies than for presses, and if a different press is more suitable it may pay to buy it even though a first stands idle a part of the time.

The steel best adapted for sheet metal drawing is not readily distinguished from its performance in the regular tensile test, for drawing produces a different form of stress in the metal. We may represent an elementary section of a piece of sheet metal being drawn by Fig. 22, where *p* represents the tensile force due to the thrust of the press and *c c* the compression due to the wedge shape of the elementary piece and its resisting the force *p*. As these elementary pieces abut against each other and are all coming in together, there is comparatively little friction for the force *p* to overcome, and the relative magnitudes of the forces may be represented by the triangle obtained by producing the two sides of the tapering part until they intersect. From this triangle of forces we may conclude that the change of form is due to tension in one direction combined with compression of about twice the magnitude in another direction, while the force in the third direction, or that of its thickness, is only nominal, or just sufficient, to keep the wrinkles from forming. As the stock pulls over the corner, bends and straightens again, the tensile stress is thrown first to one surface and then to the other, and in this way does more stretching than it otherwise would.

Several instances have come to my notice which would indicate that the action of steel under this combined stress of tension in one direction and compression in another is different from that under either stress taken separately.

The two examples mentioned above, where a 1⅜-inch hole could not be stretched to 2 inches without tearing, under tensile stress alone, and the wheel rim which stretched from 9-64 to 13-32 inch under a combined tensile and compressive stress, indicate something more than a variation in stock. In one case we fail to get an elongation of less than 50 per cent., while in the other we get easily an elongation of 200 per cent.

Special Sheet Metal Work.

The Avery Stamping Company, Cleveland, Ohio, call attention to their ability to perform drawn, dished, flanged, pressed, sheared and intricately shaped sheet steel work of almost any description. They have been in the general metal working business 17 years, during which period machinery and appliances that would serve to facilitate and improve have constantly been added, until at the present time they own a very complete and efficient equipment of hydraulic drawing and blanking presses of enormous power, shears, flanging machines, punches, &c. They make a very large variety of special articles, such as seamless steel tanks for automobiles or for holding all kinds of fluids and gases, cylinders and shells, for which they also make heads and bottoms; heavy pans and numerous other vessels, sketch plates, 18 gauge and heavier, especially of small dimensions, all furnished promptly according to specifications. Standard and special washers are also made.

Empire Iron & Steel Company.

The Empire Iron & Steel Company, organized some time since, are building a plant at Niles, Ohio, consisting of six sheet mills, bar mill and squeezers, with scrap and puddling furnaces, waste heat boilers, steel buildings, trestle tracks for unloading, cranes, shears, machine shop and all small machines to operate by electricity. This plant will have all labor saving appliances known to good rolling mill practice, and is being built for service and economical cost of production. The engines are of the Allis make, the firing boilers are made by the Stirling Company, and the waste heat boilers are of the Cahall type. Everything about the plant is of the same standard of excellence. All contracts have been let for several months, and the mill will likely be in operation in August.

A REPORT from Seattle states that smelters for Tin Ore and Block Tin works are shortly to be erected in that city in connection with the development of the Tin deposits found in the vicinity of Cape York. W. M. Courtois of Detroit and other capitalists are preparing to open up these deposits, which are said to cover more than 2000 acres in the immediate vicinity of Cape York, and to contain large deposits of Placer Tin and Tin Stone of the highest grade. Samples of the Ore brought to Seattle recently proved very rich in metal, one 20-pound piece of Ore showing 64 per cent. of Tin.

PATTERN FOR SINK DRAINER.

(Without allowance for laps.)

It is often the case that the trap under the kitchen sink is choked or blocked, owing to a collection of refuse matter. To avoid this a sink drainer is used. A perspective view of an article of this kind is shown in Fig. 1. This drainer is intended for use in the kitchen sink, being fastened through the wire loops A, B and C. The refuse matter is poured into the drainer, from which it is easily removed. It can be made of tin or black or galvanized iron, but where a good job is wanted it had best be made of 16-ounce copper.

To obtain the pattern for any sized drainer proceed as follows: First draw the plan of the drainer, A B C in Fig. 2, which gives the size of the top opening. A B C is a right angle, the arc A C being struck from the center B. Directly above the plan draw the side elevation, as shown by D E F, making D E the desired hight and E F equal to A B. Draw a line from F to D, which will give the flare of the drainer and radius with which to strike the pattern. Now divide the arc A C in the plan into an equal number of parts, as shown from 1 to 6. Then, using D F in the elevation as radius and D in Fig. 3 as the center, describe the arc 1 6. From any point in the arc, as 1, draw the line 1 D. Then, starting from the point 1, lay off on the arc 1 6 the stretchout of the arc 1 6 in the plan, Fig. 2, as shown by similar figures on 1 6 in Fig. 3. Draw a line from 6 to D. Then will 1 6 D represent the front of the drainer shown in Fig. 1. Small perforations should be punched as shown in Fig. 3. Now with D E in Fig. 2 as radius and D in Fig. 3 as center describe the arcs E and E, which intersect with arcs struck from 1 and 6 as centers and F E or A B in Fig. 2 as radius. Draw lines, as in Fig. 3, from 1 to E to D and D to E to 6. Then will 1 6 E D E 1 be the full pattern. Laps must be allowed for seaming at the corner B in the plan in Fig. 2, and edges for wiring at the top, allowing wire loops to project at the corners, A, B and C in Fig. 1.

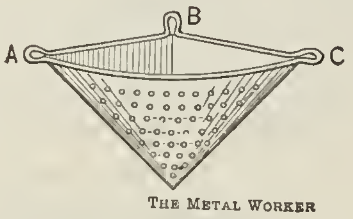


Fig. 1.—Finished View of Sink Drainer.

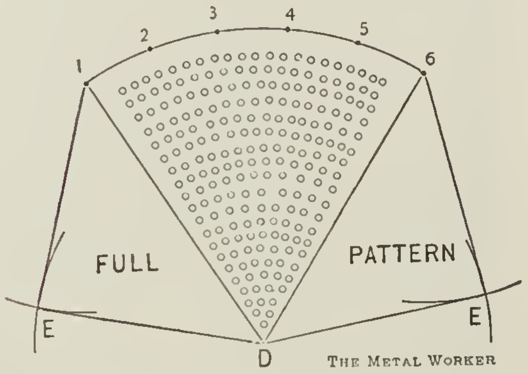

Fig. 3.—The Pattern Shape.

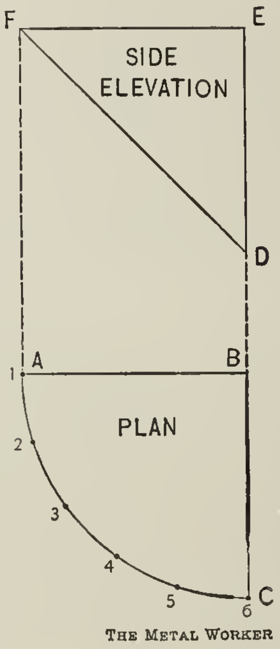

Fig. 2.—Plan and Elevation.

PATTERN FOR SINK DRAINER.

H. J. Pratt & Co., Sheet Metal workers, Springfield, Mass., have recently moved into fine, new quarters on Dwight street. The firm have just secured an important contract for the Galvanized Iron work in connection with the North Chestnut Street Grammar School at Springfield. Another large contract which has been taken by them is for the Cornices, Skylights and all the metal work on the new block which Joseph La Liberte is building on Oak and State streets.

FLASHINGS

Lodges of the Amalgamated Association have recently been formed in connection with a number of the independent Sheet mills, and these mills, which have heretofore been operating on a nonunion basis, will be asked to sign the amalgamated scale on July 1. It is estimated that fully a dozen mills will then come under the jurisdiction of the association. But little trouble is feared, as the majority of the companies are said to have already signified their willingness to sign the amalgamated scale.

The Ashland Sheet Mill Company, Ashland, Ky., are preparing to start two more Sheet mills in addition to the four already running. The plant will have eight Sheet mills when completed, as well as a galvanizing department.

Work is being rapidly pushed on the new plant of the McKeesport Mfg. Company, at Port Vue, near McKeesport, Pa. The plant will start with ten hot mills, but the company possess enough land to double the plant when the increase in their business calls for such expansion. It is expected that the new plant will start into operation about November 1.

The American Sheet Steel Company have nearly completed some important repairs and improvements at their works at McKeesport, Pa. Two new mills have been added, making 18 Sheet mills in all. The plant will be restarted before the end of this month.

John H. Middleton, cashier of the Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, has accepted a position with the Valley works of the Republic Iron & Steel Company, Youngstown. He has been succeeded by Frank Jarvis.

Henry Weyand, Waterbury, Conn., has taken the agency for the Smith-Warren Company's Metal Window Frames. He has lately secured contracts for 25 of these Frames in the new warehouse of R. N. Blakeslee, Waterbury, and three for the Naugatuck Malleable Iron Company, Naugatuck, Conn.

George C. McMurtry, president of the American Sheet Steel Company, has taken several ministers of the Gospel from Vandergrift, Pa., and its vicinity, on a trip abroad. The voyage is to include all the usual points of interest in Europe, together with a visit to the Holy Land.

The John Schwing Company, Bridgeport, Conn., have been incorporated with a capital stock of $5000, to repair Cornices and Skylights. The officers are: John Schwing, president and treasurer, and Katie Schwing, secretary.

Previous to his departure from Elwood, Ind., Clark Price, who has been appointed private secretary to President D. G. Reid of the American Tin Plate Company, was entertained by a number of his fellow employees at the company's Elwood plant, at a banquet at the Stephenson Hotel, Elwood, when a number of handsome gifts were presented to him in token of the esteem of his fellow workers. Mr. Price has been local manager of the Elwood works since the resignation of F. M. Strong.

An unusually large number of the Welsh mill men employed in the various Tin Plate and Sheet mills have gone over this year to visit their native country.

Steel Fronts, Metal Coverings and Fire Proofing for all kinds of buildings form the subject matter of an illustrated circular issued as a supplement to their regular catalogue, by the St. Paul Roofing, Cornice & Ornament Company, St. Paul, Minn. A number of halftone views are given, showing examples of artistic sheet metal building construction in the case of stores, banks, residences, small factories and public buildings covered by Galvanized Steel Fronts and Siding. Diagrams are also given with directions as to measurements in asking estimates or ordering material for this work, also tables of comparative costs of construction of different kinds of materials.

The eleventh annual convention of the National Association of Master Composition Roofers will be held in Providence, R. I., from July 16 to 18. The objects of the association are to maintain an organization for the benefit of persons engaged in the business of Composition Roofing; to promote uniformity of customs; to acquire and disseminate among the members information in reference to methods of doing work; to establish a superior quality of material and workmanship, and to facilitate the speedy adjustment of business disputes.

It is probable the Canonsburg works of the American Tin Plate Company, at Canonsburg, Pa., will be closed down about July 1, and that the plant will not again be operated. It is a five-mill plant, and the equipment will likely be removed to some other of the more important works of the American Tin Plate Company.

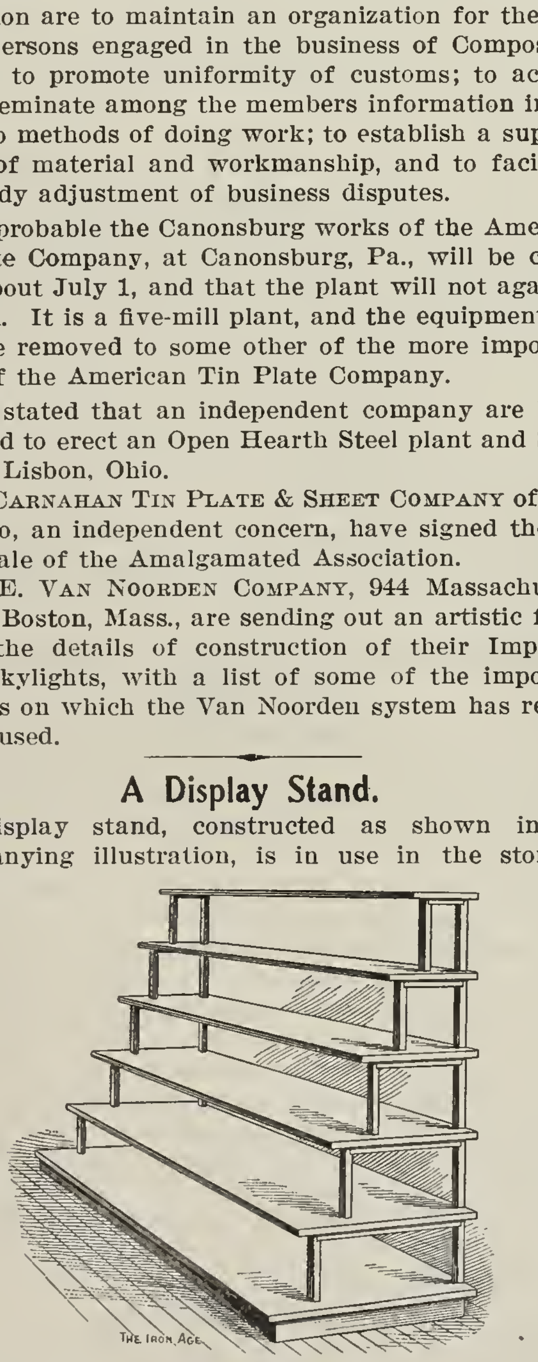
It is stated that an independent company are being organized to erect an Open Hearth Steel plant and Sheet mills at Lisbon, Ohio.

The Carnahan Tin Plate & Sheet Company of Canton, Ohio, an independent concern, have signed the Tin Plate scale of the Amalgamated Association.

The E. Van Noorden Company, 944 Massachusetts avenue, Boston, Mass., are sending out an artistic folder giving the details of construction of their Improved Metal Skylights, with a list of some of the important buildings on which the Van Noorden system has recently been used.

A Display Stand.

A display stand, constructed as shown in the accompanying illustration, is in use in the store of James Wilson, Stamford, Conn. It will be noticed that each shelf is a little narrower than the one directly under it, thus permitting the articles on the lower shelves to be seen to good advantage without compelling the customer to lean over. The shelves are finished in cherry stain, and hold a variety of articles to which it is desired to attract attention.



A Display Stand.

The Sheet Mill Scale Settled.

At a conference held in Pittsburgh on Friday, June 13, between Persifor F. Smith, John Warner and Harry Cook, representing the American Sheet Steel Company, and the Sheet Mill Conference Committee of the Amalgamated Association, the wage scale governing sheet mills for the year ending June 30, 1903, was adopted. The scale is practically the same as the one which expires on June 30 next, the base rates being as follows:

It is agreed that when the actual average selling price of Nos. 26, 27 and 28 gauge plain sheet steel, f.o.b. mill, is 3 cents per pound the wages for rolling on a sheet and jobbing mill shall be as follows, with 2 per cent. additional for each one-tenth advance above said 3 cents selling price, and 2 per cent. decline for each deduction of one-tenth to said 3 cents selling price:

Gauges.	Price for rolling iron, per ton, 2240 lbs.	Price for rolling steel, per ton, 2240 lbs.
No. 8 and heavier	$3.60	....
Nos. 9 to 11	4.00	....
" 12 to 14	4.80	....
" 15 to 17	5.55	....
" 18 to 21	6.75	....
" 22 to 24	8.00	$8.80
" 25 to 26	9.20	10.12
No. 27	10.00	11.00
" 28	10.65	11.71
" 29	11.15	12.30
" 30	12.00	13.20
" 31	15.60	17.10
" 32	18.90	20.80

Gauges.	Price for rolling on a 3-cent card, per ton, 2240 lbs.
No. 8 and heavier	$3.00
Nos. 9 and 10	3.50
No. 11	4.00

This to apply to only jobbing mills rolling No. 18 and heavier over 48 inches in width.

The only changes made in the scale were in the foot notes. No. 4 was changed to read as follows:

No. 4. "All sheet iron or sheet steel shall be weighed by the company after being sheared and opened, and the company shall furnish the complete weight of each turn to the roller when run over and annealed in open furnace, or put the same in a convenient place in the mill within a reasonable time after being made."

In the sheet mill hands' scale no changes were made, but a new foot note, No. 17, was added, as follows:

"17. 25 gauge and lighter, double double, eighty-four (84) pairs shall equal 105 pairs of double iron, and not to be averaged. This to apply only to sheets sixty (60) inches long and shorter lengths."

In the scale for roughing and catching on sheet and jobbing mills no changes were made, but a new foot note, No. 7, was added, which reads:

"7. 25 gauge or lighter, double double, 84 pairs shall equal 105 pairs of double iron and not to be averaged. This is to apply only to sheets 60 inches long and shorter lengths."

No time has yet been fixed for a conference between officials of the American Steel Hoop Company and the Amalgamated Association. At a recent meeting some changes in the foot notes of the bar iron scale were asked by the American Steel Hoop Company, and these are now being considered by the Amalgamated Association. It is probable another meeting will be held at an early date, perhaps this week or next week.

No time has been fixed for a conference between officials of the American Tin Plate Company and the Amalgamated Association, but a meeting will likely be held in New York City at a very early date, when the tin plate scale will be arranged. No changes were made in the prices in the scale submitted by the Amalgamated Association, but it is possible a few minor changes may be made in the foot notes. The sheet mill scale has been signed for the American Sheet Steel Company and also the tin plate scale by the American Tin Plate Company, in so far as the wage rates are concerned, but a conference is necessary in order to adjust the foot notes.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

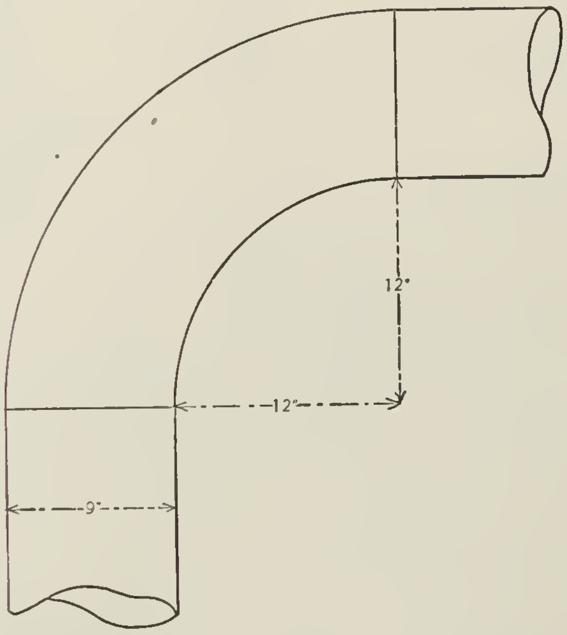
PATTERN FOR CURVED ELBOW.

From E. K., Philadelphia, Pa.—Will you please inform me through the columns of *The Metal Worker* how to obtain the patterns for a five-pieced 90-degree elbow, 2 inches in diameter, curved both in plan and elevation?

Answer.—The problem which our correspondent presents is an interesting one both in projections and developments. In this case, however, we would suggest that for a small elbow of the size given he use what is known to the trade as an adjustable elbow, which can be purchased from dealers, and which is indispensable in putting up pipes where odd turns or angles are to be fitted, as in our correspondent's case.

LAYING OUT AN ELBOW OR CURVE OF GIVEN RADIUS.

From G. H. G., Fall River, Mass.—I have received much valuable information from the columns of *The Metal Worker*, and would like to have some one explain the best way of laying out an elbow, or turn, of a given radius, such, for example, as that indicated by the sketch inclosed. The architects of the mills in this city, in drafting conductor pipe, give us the radius on which the elbows shall turn, and I want to see if there is any better way of laying out the work than mine, which is represented by the sketch.



THE METAL WORKER

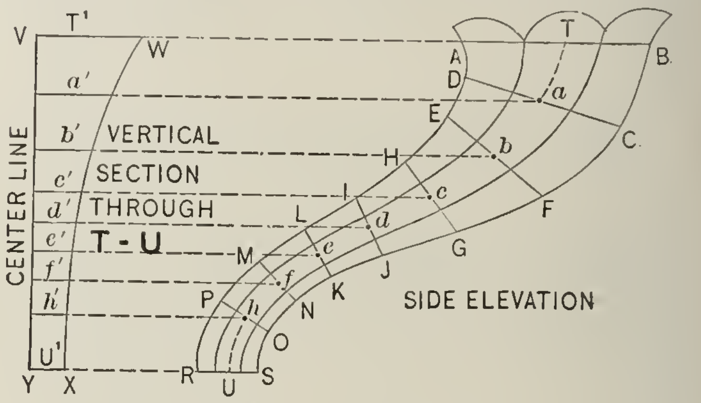
Laying Out an Elbow or Curve of Given Radius.

PATTERN FOR A CORNUCOPIA.

From J. H. T., New York.—I should be glad if *The Metal Worker* would give a practical design of a cornucopia to be made from sheet metal, and also the rules for obtaining the pattern?

Answer.—In the accompanying sketch a section anywhere on one of the lines, as H G, is a polygon. Our correspondent's question presents an interesting study in projections and developments, the principles of which are clearly set forth in the pattern problem entitled "Ship's Funnel from Lateral Pieces," published in *The Metal Worker* of September 1 and 8, 1900.

In the accompanying illustration is shown a practical design of a cornucopia, wherein the lines A B and R S run parallel. In applying to the cornucopia the principles shown in the above mentioned issues proceed as follows: First draw the outline of the cornucopia, as shown by A B S R; also a vertical section through the center of the side elevation, as T U, as shown one-half by V W X Y. This vertical section is obtained by making the distance V W and X Y equal to T B or T A and U S or U R, respectively, in side elevation. Draw at pleasure the curved line X W in section. Next divide the curves A R and B S into an equal number of spaces and draw the planes D C, E F, G H, I J, K L, M N and O P, all of which bisect, and obtain the centers *a*, *b*, *c*, *d*, *e*, *f* and *h*, respectively. From these centers draw lines parallel to A B intersecting the half section at *a'*, *b'*, *c'*, *d'*, *e'*, *f'* and *h'*. Then will the lines shown in side elevation represent the length of the true sections which must be constructed, while similarly lettered lines in the half sections will represent the half widths of the true section.



THE METAL WORKER

Pattern for Cornucopia.

With these points of information and with the necessary rules given in the above mentioned issues of *The Metal Worker*, our correspondent should find no difficulty in solving this problem.

SHOULD USE LARGER SUCTION PIPE.

From J. K. R., Pittsfield, Mass.—Having read the letter of "N. H. B." in *The Metal Worker* of June 14, I would suggest that his pump would work easier if a larger suction pipe was used, as the friction in a pipe 100 feet long will amount to considerable. I would say that it ought not to be less than 1½ inches for so long a distance. Then, if the pump is tight, it will lift the water the 16 feet and overcome the friction in the long pipe. If the lift is more than 16 feet and the small pipe is used there can be no doubt that the pump will have to be in good working order, and it will take some muscle to operate it. Otherwise, there is nothing in the arrangement to interfere with successful operation. A better grade of pump might be more satisfactory.

INTERSECTION BETWEEN COLLAR AND CYLINDER.

From E. K., Philadelphia, Pa.—It would please me very much if you would show me through the columns of *The Metal Worker* how to obtain the correct length for a 45-degree collar with seam at the side intersecting a cylinder.

Answer.—On page 47 of *The Metal Worker* of April 12, 1902, is shown a problem entitled "Patterns for Intersecting Pipes," in which the principles are explained for obtaining the true length and intersections, and which can be applied to our correspondent's problem.

◆

The wage scale of the Amalgamated Association was signed last week by the Republic Iron & Steel Company, and it is expected most of the mills of that concern in the Central West and South will run right through the summer months, as the concern are very much crowded with orders. It is possible a few of the plants will be closed down for a short time for necessary repairs and stock taking.

Alexander C. Humphreys of the firm of Humphreys & Glasgow, New York and London, has been elected president of the Stevens Institute of Technology, Hoboken, N. J., in succession to the late Dr. Henry Morton.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin has declined about 1c. in price and is weak and dull.

Copper is dull and declining.

Pig Lead is unchanged and quiet.

Spelter remains strong, with spot metal scarce.

Antimony is unchanged.

Nickel is in good demand and without change in price.

Aluminum is firm and in good demand.

Tin Plates are quiet, with prices unchanged.

Sheets are very firm in price and with good demand for the heavy gauges of Black.

Old Metals are rather dull and weak.

Foundry Iron gets scarcer every day, with prices extremely strong and high.

Sheet Copper is in good demand, with prices firm.

Sheet Zinc is without change.

Hardware is less active on approach of summer dullness; prices rule firm.

Cast Iron Sinks have been advanced 15 per cent. in price, and all Cast Iron Goods are expected to undergo similar advance.

Malleable Fittings are slightly higher in price, Malleable Unions being up 5 per cent.

Tarred Roofing Paper has been advanced 3c. per roll.

Nuts were advanced 2.10c. to 3.10c. per lb. June 17.

Wire Nails are in good demand and better supply; prices unchanged.

Cut Nails are not so active, and prices remain firm.

Window Glass is dull and market unsatisfactory.

White Lead is not so active; prices remain unchanged.

Linseed Oil is in fair demand, with prospect of further advance in price.

Spirits Turpentine continues strong in price, with limited business.

METAL MARKET.

New York, June 20, 1902.

Pig Tin.—A sharp decline in Pig Tin set in at the beginning of this week, as a result of the heavy arrivals here and a sharp break which occurred in London. The reason given for the sudden drop in London is that the manipulators there have found out that America will not be a supporting power in the future. Consumers here are well supplied, and the time of the year for the closing of mills for repairs is at hand. Shipments from the Straits for the first half of this month were very large, being 500 tons greater than for the same period of last year. It is expected that they will continue on a heavy scale for some time to come. At the close the market was weak and dull, consumers being indifferent, with little or no speculative business. Straits Pig in small lots rules at about 1c. per lb. below the prices of a week ago, being quoted at 30c. to 30½c.

Copper.—The market has been extremely dull, with prices constantly declining, consumers buying nothing, in anticipation of the summer shut down, and in view of the fact that their previous prices have been rather heavy. A sharp decline is noted in the wholesale price of Lake Copper. The market at the close was dull, with an easy tone. Jobbers quote Lake Ingot in small lots at about 13c. to 13¼c. per lb., and Casting Copper at 12¾c. to 13c.

Sheet Copper.—The demand for Sheet Copper keeps up in fairly large volume, although orders are scarcely as heavy as they have been in the past few weeks. Prices continue firm and unchanged on the basis of 18c. per lb. from store.

Pig Lead.—There is no change to be noted in this market. Quiet conditions prevail, and prices are steady at the figures ruling for some time past. American Pig in small lots is quoted at 4.45c. to 4½c. per lb. St. Louis advices indicate that the volume of transactions in the market for Pig Lead at that center is limited, and the fluctuation in prices insignificant.

Spelter.—The market for Spelter remains very firm for spot. Only a small business was reported, however, as consumers are evidently not buying beyond the limit of their actual needs at present prices. Jobbers are asking about 5¼c. to 5½c. per lb. for small lots of good Western brands. St. Louis advices report that the situation in the Spelter market shows no material change. The curtailment in production due to strikes at the smelters will, it is said, be quite seriously felt when any urgent demand may come into the market. It is said that, owing to the limited offerings, a liberal premium is being paid for July delivery.

Sheet Zinc.—The demand for Sheet Zinc is of the usual proportions, and prices are unchanged at 6¼c. per lb. for 600-lb. cask lots and 6¾c. to 7c. for smaller quantities.

Antimony—Is unchanged. Hallett's in small parcels is quoted at 8⅝c. to 8¾c. per lb.; U. S. at 8⅜c. to 8½c., and Cookson's at 10¼c. to 10¾c.

Nickel.—There is no change in the market for this metal. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues active and prices are without change. Small lots of No. 1 Ingot guaranteed 99 per cent. pure are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—Nothing new has been developed in this market, which is unchanged from the conditions prevailing for several weeks past. New business is rather light, and prices have not varied to any quotable extent. The American Tin Plate Company are quoting for delivery until October 1 at the prices ruling for some time past. American Bessemer Coke Plates, IC, 14 x 20, in moderate sized lots delivered at New York or corresponding points, are quoted by jobbers at about $4.75 to $4.90 per box. A decline of 1½ pence, to 13 shillings 6 pence per box, in the price of Welsh Plates occurred this week.

Sheets.—The demand for the heavier gauges of Sheets up to Nos. 18 and 20 is heavy, and the mills are well filled up with orders on this class of material. On the lighter gauges, however, the demand has fallen off materially. It is said that some of the independent mills are naming slightly lower prices on the lighter gauges of Sheets for delivery in the second half of the year. Considering the season, the demand for Sheets keeps up in excellent volume. The mills have about all the business they can well take care of. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets at about 3.75c. to 3.80c., and No. 24 Galvanized at 4c. to 4.20c.

Chicago advices are as follows: There have been freer offerings by independent mills, and although there has been a fair demand the market has been weaker, especially for Galvanized Sheets, which have sold at lower prices, although there has been no change in the net quotations made by the combination. The system of discount is still adhered to by the independent mills. Small lots of No. 27 Black Sheets from store are quoted at 3.45c. to 3.55c., and Galvanized Sheets at 4.70c. to 4.75c.

Old Metals.—The demand for Scrap Iron is active, and prices are firm; but other Old Metals, notably Brass and Copper, are rather dull and inclined to weakness. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb. 10 c.
Light and Tinned Copper	per lb. 9 c.
Heavy Brass	per lb. 8 c.

Light Brass	per lb. 6½c.
Lead	per lb. 3⅝c.
Tea Lead	per lb. 3 c.
Zinc	per lb. 2⅞c.
Pure Aluminum Sheet	per lb. 22 c.
Cast Aluminum	per lb. 17 c.
No. 1 Pewter	per lb. 18 c.
No. 2 Pewter	per lb. 9 c.
Tin Plate Scrap, per gross ton	.... to $5.00
Wrought Iron Scrap, per gross ton	$13.00 to 13.50
Heavy Cast Scrap, per gross ton	12.00 to 12.50
Stove Plate Scrap, per gross ton	8.50 to 9.00
Burnt Iron, per gross ton	7.00 to 7.25

THE PIG IRON MARKET.

New York.—The scarcity of Pig Iron has been aggravated, so far as this territory is concerned, by the Anthracite Coal strike, which has forced a number of furnaces in the Schuylkill and Lehigh valleys to bank, and has been increasing the percentage of off Iron made by those which have continued in operation. Sellers are at their wits ends to meet the requirements of their customers, and some are parceling out small importations of Scotch Pig. There is some inquiry for 1903 delivery, but except in those cases in which usual contracts for a whole year's requirements are closed little appears to have been done. Some of the leading makers are discouraging buying at present prices for 1903 delivery, while others are willing to book some orders close to the present range. Quotations for summer delivery are as follows: Northern Iron, at tidewater, No. 1 X, $22.50 to $23; No. 2 X, $21.50 to $22; No. 2 Plain, $21 to $21.50. Tennessee and Alabama brands are quoted as follows: No. 1 Foundry, $21.75 to $22; No. 2 Foundry, $20.75 to $21.25; No. 3 Foundry, $20.25 to $20.50.

Chicago.—The result of the stringent market for Pig Iron is an advance of 50c. per ton on all Southern Iron for future delivery. Northern Iron, too, is tending upward strongly. Iron for immediate delivery is becoming scarcer each week, and it is almost impossible to give reliable quotations, it being a question of delivery and not of price. The little Iron of this character that is being sold commands from $2 to $3 per ton over the prices current for future delivery. With the extension of the strike among the Coal miners, the outlook for an adequate supply of raw material to the consumer of Pig Iron is assuming a more serious aspect. It is asserted that a number of furnaces will go out of blast within a few days, which fact, with the many furnaces already banked, causes uneasiness, if not alarm, among foundrymen. The scarcity, with higher prices, of Coke is also an important feature in the market at the moment. We quote as follows:

Lake Superior Charcoal	$24.00 to $25.00
Local Coke Foundry, No. 1	22.50 to 23.00
Local Coke Foundry, No. 2	21.50 to 22.00
Local Coke Foundry, No. 3	21.00 to 21.50
Local Scotch, No. 1	22.00 to 23.00
Ohio Strong Softeners, No. 1	24.00 to 24.50
Southern Silvery, according to Silicon	22.65 to 24.65
Southern Coke, No. 1	22.15 to 22.65
Southern Coke, No. 2	21.65 to 22.15
Southern Coke, No. 3	21.15 to 21.65
Southern Coke, No. 1 Soft	22.15 to 22.65
Southern Coke, No. 2 Soft	21.65 to 22.15

Philadelphia.—There is greater scarcity of Pig Iron now than at any time on record. Price has nothing to do with it, the only point is to find the Iron, and when that is done there is no difficulty in arranging prices. For July and August shipments of No. 2 X Foundry, prices rule from $22 to $22.50, and for the last quarter of the year, $21.25 to $21.75. Sellers are not seeking business, being already sold pretty well to their full limit. Some business has been entered for the first half of 1903 at prices ranging from $20.75 to $21.25 for No. 2 X Foundry, but makers now quote more money. It appears as though there will be no material change in the market for several weeks to come. The following are the quotations for Pig Iron for city and nearby points, for delivery during the last quarter of the year; July, August and September deliveries being from 50c. to $1 more money:

No. 1 X Foundry	$23.00 to $23.50
No. 2 X Foundry	21.50 to 21.75
No. 2 Plain	20.75 to 21.25

Pittsburgh.—The Pig Iron market has been quiet during the week, the furnaces being practically sold up for the next four to six months, and buyers pretty well covered. The recent strike at the furnaces took about 75,000 tons of Iron out of the market, making the scarcity of metal keener than ever. Furnace operators are giving their attention to filling old contracts for Iron in preference to making new noes. The market is very strong. No. 2 Foundry is quoted at $21 to $21.50, Pittsburgh.

Cincinnati.—The strike in the Coke regions is having a depressing effect on the Pig Iron market, and prices are higher as a consequence. Very little spot Iron is offered, many of the Southern furnaces being entirely withdrawn from the market. The market for spot Iron is irregular, although the general idea seems to be that $17.50 to $18, Birmingham, for No. 2 Foundry is as near the actual value as can be determined. We quote, f.o.b. Cincinnati, as follows:

Southern Coke, No. 1	$21.00 to $21.25
Southern Coke, No. 2	20.50 to 20.75
Southern Coke, No. 3	20.00 to 20.25
Southern Coke, No. 4	19.50 to 19.75
Southern Coke, No. 1, Soft	21.00 to 21.25
Southern Coke, No. 2 Soft	20.50 to 20.75
Ohio Silvery, No. 1	24.10 to 24.35
Ohio Silvery, No. 2	23.60 to 24.10
Lake Superior Coke, No. 1	24.60 to 25.10
Lake Superior Coke, No. 2	24.10 to 24.60
Lake Superior Coke, No. 3	23.60 to 24.10

St. Louis.—Transactions in the Pig Iron market have been on a moderate scale. Offerings of Iron are distinctly lighter and prices moving to a higher level. While the market is very quiet now it would seem that it cannot remain so very long, as it is coming to the time when many foundry interests will come into the market for future requirements, and unless a more liberal supply of material than now can be offered it would seem that a general stiffening in prices would come about. The following is the range of prices current for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$20.25 to $22.50
Southern, No. 2 Foundry	19.50 to 21.75
Southern, No. 3 Foundry	19.00 to 21.25
Southern, No. 4 Foundry	18.50 to 20.75
No. 1 Soft	20.00 to 22.25
No. 2 Soft	19.50 to 21.75

CHICAGO REPORT.

Scrap Iron and Steel.—The offerings have not been large, but ample, and the market has remained steady for all kinds of Scrap, with a fair outlet through the mills. We quote dealers' prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	.... to 13.00
Malleable Cast	12.00 to 12.50
Stove Plate (free from burnt)	.... to 9.50
Burnt Iron and Grate Bars	8.00 to 9.00
Sheet Iron and Hoops	8.00 to 9.00
Plow Steel	12.00 to 13.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	8.50 to 9.00
Turnings	12.00 to 12.50
Horseshoes	14.00 to 14.50

Old Metals.—The market for both Copper and Brass has been easy with freer offerings, and only a moderate demand, as consumers are disposed to purchase Ingot Copper rather than old material at the present prices. Lead and Zinc have been better sustained with a fair demand. The following prices are being paid by dealers in this market:

	Per lb.
Copper Wire and Heavy	11 c.
Copper Bottoms	10 c.
Copper Clips	11 c.
Red Brass	11 c.
Yellow Brass	8¼c.
Red Brass Borings	10 c.
Yellow Brass Borings	7½c.
Light Brass	7 c.
Pipe Lead	3.70c.
Tea Lead	3.35c.
Zinc	3⅛c.
Tin Foil	22 c.
Pewter, No. 1	19 c.
Pewter, No. 2	11 c.
Aluminum	20 c.

Old Rubber.—The offerings of Rubber Shoes have increased, and with but little outlet, the market is weaker and prices are fractionally lower. Other kinds have remained steady. The following are the prices paid by dealers in this market:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7 c.
Rubber Car Springs	....	5 c.

Inside Bicycle Tubing	22 c.
Outside Tubing	6 c.
Black Rubber	4 c.
White Rubber	8½c.

Rags.—There has been a slow and easy market, but prices have been without essential change. Dealers continue to buy at 70c. to 75c. per 100 lbs., Chicago delivery.

Anthracite Coal.—The situation in the Coal fields is without improvement, and dealers in this market have confined their energies to the fulfillment of previous contracts. While a strong tone prevails prices remain unchanged, subject to a discount of 30c. per ton for shipments made during the month of June:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

THE HARDWARE TRADE.

In the midst of the continued pressure of current business there are many indications of the presence of the summer months, when trade relaxes its demands and the activities connected with the producing and the marketing of goods are perhaps as much interrupted as at any time in the year. The manufacturers are preparing for the stoppage in whole or part of their factories for the purpose of making repairs, overhauling machinery and perhaps increasing their facilities. The pressure of business, therefore, is such that there will not be any longer interruption of production than is necessary, and some of the manufacturers will gladly avail themselves of the opportunity to repair broken stocks and accumulate something of a supply for the fall business. This is a season when the orders from the large trade are light, many buyers having already placed orders to cover their requirements. Labor agitations will probably attract some attention, and business is already somewhat disturbed by the coal strike, both in its interference with the supply of fuel and in the restlessness which is connected with it. Wages in many lines in which skilled workmen are employed are higher than a year ago, and the tendency is gradually upward. This fact, with the condition of the market in the raw material, gives firmness to prices. Many kinds of heavy goods are decidedly scarce and held at high figures. Trade throughout the country is moving along in excellent volume. The promise of the crops is such as to cause no general solicitude, with a good prospect that their abundance on the whole will lay a foundation for continued good times. One penalty of the prosperity which prevails here, with its natural accompaniment of high prices, is the falling off in the volume of exports in certain lines. While some manufacturers are wise enough to take a broad view of the situation and take care of foreign business even to the neglect of some urgent calls from the home market, others are apparently sacrificing their interests in export trade, as they are failing to make the most of connections already established with foreign houses. A wiser policy, however, prevails in the counsels of others, and in general it is to be said that manufacturers are using enterprising and energetic measures to extend their trade relations in the markets of the world.

NOTES ON PRICES.

Cast Iron Sinks.—Cast Iron Sinks were advanced in price this week. The manufacturers announced, on the 16th inst., new prices, which show an advance of 15 per cent. upon the previous quotations. The scarcity and high price of Coal and Pig Iron are said to be the reasons for the change. The trade may expect a similar advance in the price of all goods of a similar nature, such as Cesspool Bell Traps, Stable Cesspools, Sidewalk Grates, Slop Hoppers and Traps, and Stop Cock Boxes.

Malleable Fittings.—The manufacturers of Malleable Fittings announced new prices on the 13th inst. The prices show a slight advance on some of the smaller sizes of Fittings sold on the pound list, and an advance of 5 per cent. on Black and Galvanized Malleable Unions. It is noticed that the new prices were issued only by the concerns mentioned as being interested in the proposed consolidation of manufacturing and jobbing interests. The condition of the market, however, is such as to warrant the adoption of the new quotations by all firms manufacturing the sizes of Fittings affected.

Plumbers' Marble.—The settlement of the labor troubles of the local Marble yards has brought relief to the plumbing trade. The local jobbing houses have been put to considerable trouble in procuring Marble with which to fill their orders for stock sizes. The few houses which carry stocks of Marble Slabs insisted upon premium prices for pick up orders. It was impossible to get special Slabs. owing to the fact that all out of town yards are away behind with their orders for Architectural Marble. The principal Marble interest in the United States are said to be more than 25,000 Plumbers' Slabs of stock sizes behind in their orders.

Berger Bros. Company, Philadelphia, Pa., announce that, owing to the very heavy advance in raw materials, they are compelled to change the discount on Shanks and Circles to 15 per cent. to the trade; terms as usual. The retail price is at the net list figures.

Cast Iron Soil Pipe.—We are advised by Haines, Jones & Cadbury, Philadelphia, that the figures on Medium Pipe, given in our last week's note, are incorrect, so far as Philadelphia is concerned. The price in less than carload lots, they say, is 21 cents per foot for 4-inch Medium Pipe, Single Hub, and 22 cents for Double Hub 4-inch Medium Pipe.

Tarred Roofing Paper.—Prices on Tarred Roofing Paper are changed somewhat in several sections of the country, including New England and parts of Pennsylvania and Maryland. The change involves an advance of about 3 cents per roll on Two and Three Ply Tarred Roofing Paper, making the prices 58 and 80 cents per roll, instead of 55 and 77 cents, as formerly.

Nuts.—A meeting of the manufacturers of Nuts was held at Atlantic City on Tuesday, and an advance of 2-10 cent per pond was made in the prices of Cold Punched and Hot Pressed Square Nuts, and an advance of 3-10 cent per pound in both Cold Punched and Hot Pressed Hexagon Nuts. The manufacturers united in giving gratifying reports in regard to the volume of business, and the prospect of a continuance of satisfactory conditions.

Follansbee Brothers Company, Pittsburgh, Pa., sent out under date of June 12 a new price-list of the high grade Roofing Plates which they manufacture, also Bright Plates, Sheet Zinc, Black and Galvanized Sheets, Stove Pipe Material, Wood's Refined Smooth Iron Sheets and Patent Planished Iron, Wellsville Polished Steel Sheets and Steel and Galvanized Roofing, Siding and Ceiling, and Galvanized Ridge Roll. The prices named by the company should be attractive to the trade.

C. W. Evans Steel & Iron Company, Cincinnati, Ohio, are sending out a circular announcing a special sale of goods, among which is Galvanized Pump Chain, which is offered at $3.80 per 100 pounds, f.o.b. cars, Pittsburgh, in full barrel lots.

Wire Nails.—The business in Wire Nails in the New York market is of good proportions, owing to the amount of building under way. The statement is made in the daily papers that there are 2365 buildings in course of construction in the Borough of Manhattan alone. Supplies from mills are coming in more freely, and prices are unchanged, small lots from store being quoted at $2.30 per keg.

Cut Nails.—The smaller demand for Cut Nails has relieved the situation somewhat, although difficulty is still experienced in getting prompt shipments of Iron Nails from mills. The local demand is of fair proportions. Small lots of Cut Nails from store are quoted at $2.30 per keg.

Window Glass.—The demand for Window Glass continues quiet. The Associated Jobbers' quotations are unchanged. Glass purchased at low prices and lack of demand preclude the advisability of an advance by the jobbers on the present unsatisfactory market. Single and Double Strength Glass from store is quoted at 89 per cent. discount.

White Lead.—The demand for White Lead in Oil continues fair, although there is a perceptible falling off in the size and number of orders. Small lots of White Lead in Oil from store are quoted at 6½ to 6¾ cents per pound.

Linseed Oil.—The current demand for Linseed Oil is confined to small lots, large buyers not placing orders. There is some talk among the trade of the possibility of an advance before the beginning of next month, the figures named being 70 cents per gallon for City Raw. Prices are unchanged from those given last week, City Raw, in small lots, being quoted at 67 to 67½ cents per gallon.

Spirits Turpentine.—Owing to the strength developed at Southern points, the local Turpentine market continues strong at last week's quotations. Business is on a limited scale, owing to the high prices. Turpentine in small lots is quoted at 50 to 50½ cents per gallon.

TRADE NOTES.

The Kilbourne & Jacobs Company, Columbus, Ohio, have increased their capital stock from $1,125,000 to $1,250,000.

The Hewitt Mfg. Company, Chicago, are about to erect a Brass foundry on a site, 40 x 100 feet, at the corner of Emerald avenue and Fortieth street. The plant will cost about $100,000.

Two large sized postal cards sent out by the Grasselli Chemical Company, Cleveland, Ohio, advertise in an artistic manner their Eureka Soldering Flux, which is especially recommended to the attention of tinsmiths and others using Solder.

A card is being sent through the mails by the Joseph Dixon Crucible Company, Jersey City, N. J., which gives a picture of the new Hotel Astor, now being erected in New York City, with the information that the steel structural work of the building is being protected with Dixon's Silica Graphite Red and Green Paint.

The Roseberry Zinc Company, with principal office at 525 Main street, East Orange, N. J., have been incorporated with a capital stock of $200,000 by C. V. Childs, George T. Mills and H. N. Smith to manufacture Zinc.

The Tucker Tool & Machine Company were recently incorporated and are carrying on a business in Factory and Mill Supplies at 135 Greenwich street, New York. The officers are M. E. Stone, president and treasurer, and C. H. Tucker, Jr., general manager. This is a continuation of the business carried on by C. H. Tucker, Jr., since 1885. The company will continue to act as agents for the Wiley & Russell Mfg. Company, Welding Compound Company, Anderson Pipe Cutter Company, the Crosby Hack Saws and other leading lines.

The Atlas Paint & Specialty Company, 433-435 Pearl street, Cincinnati, Ohio, are successors to the Frank Happell Mfg. Company, manufacturers of high grade Paint Specialties. Jet-E-nam, their principal brand, is an enamel for producing a permanent jet black on bicycles, radiators, ranges, stove pipes, mantels and grates, and, it is claimed, is not affected by heat or cold. The company report an excellent demand for their various specialties.

The J. A. Harps Mfg. Company, Greenfield, Ohio, are now manufacturing the Never Fail Can, having purchased the interest of the former maker, C. W. Price. The Can is designed for oil or gasoline, a peculiar feature in its construction being that the oil does not touch the inside of the Can pump.

The St. Louis Enameling Company of Ninth and Monroe streets, St. Louis, want bids on their Malleables for the coming season.

The Coe Brass Mfg. Company, Ansonia, Conn., are using a new process for extruding metals, by which they will make bars of Malleable Brass, Alloys, Manganese Bronze, &c. The process consists of forcing the heated metal by hydraulic pressure through a die of any desired shape. Extruded Bars can thus be made ranging from the lightest sections to heavy Round, Square or Hexagon Bars. The Extruded Metal can be used in many kinds of structural work where a strong rustless metal is desired.

The Providence Aluminum Company, Providence, R. I., are operating a jobbing Aluminum and Brass foundry and workshop. They have turned out Aluminum Bronze Castings weighing as much as 380 pounds.

The Dayton Hardware Company, Portland, Ore., are offering their device for killing and removing insect pests from houses, sanitariums, hospitals, hotels, &c. The insect is killed by simply pushing their killer against it when resting on the ceiling or wall, and can be easily shaken off. It is killed, it is remarked, without being crushed and without soiling the most delicate wall or paper.

W. A. Slocum, who for some time past has been a traveling salesman for the Aluminum Mfg. Company of Two Rivers, Wis., has gone into partnership with Oscar Wurlitzer. The firm have opened an Aluminum store at 613 Wells street, Chicago.

Gummey, McFarland & Co., = - Philadelphia.

DOES IT PAY

to use coated sheets in place of black? It does if you use the ALUMINUM COATED. Some of our customers are using it as a substitute for copper. It can be soldered with common solder.

STEEL & IRON ALUMINUM COATING CO.,

CONNELLSVILLE, PA.

Your Customers are going to the ——

TO THE MAN WHO USES

ALUMINUM COATED STEEL

because he assures them that it will last ten times as long as Galvanized Iron and they want it, even if it does cost a trifle more. To keep in with them and retain the trade you have been at such pains to establish you must cease using Galvanized Steel, that peels, corrodes and is soon full of holes, and use only Aluminum Coated Steel, that never rusts and solders nicely. Let us send you a sample. You should see how it works.

How to Make the Best Roof

M F Roofing Tin is the first requisite; capable work the second—that is all—except, the roof will last 50 years. The manufacturers of M F Roofing Tin have lately published a complete manual of roofing and roofing material which will be sent free to anyone interested in roofs.

MF Roofing Tin

is made entirely by hand labor—the "old-style" process. It has the heaviest coating of pure tin and new lead—impervious to rust or atmospheric gases. Ask your roofer—or for a copy of the book,

SHOWING DOVETAIL KEYS.

Some Dealers Don't Care

Whether the Metal Ceilings they sell are artistic or not. That's where they make a mistake. The more artistic the ceilings they sell the greater the chance of their building up a good demand for this class of goods. Every first-class ceiling erected helps to sell others.

"BERGER'S Classik" TRADE MARK METAL CEILINGS

Are the most artistic made. They adhere strictly to correct style of ornamentation. They make it easy to decorate in harmony of style throughout.

Berger's "CLASSIK" Metal Ceilings are bound to greatly increase the popularity of Metal Ceilings. The wide-awake dealer should apply for an agency without delay.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of **218** problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added **75** new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections), —325 pages.
  1. MITER CUTTING,
  2. FLARING WORK,
  3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

The New Metal Worker Pattern Book.

Price $5, post or expressage paid.

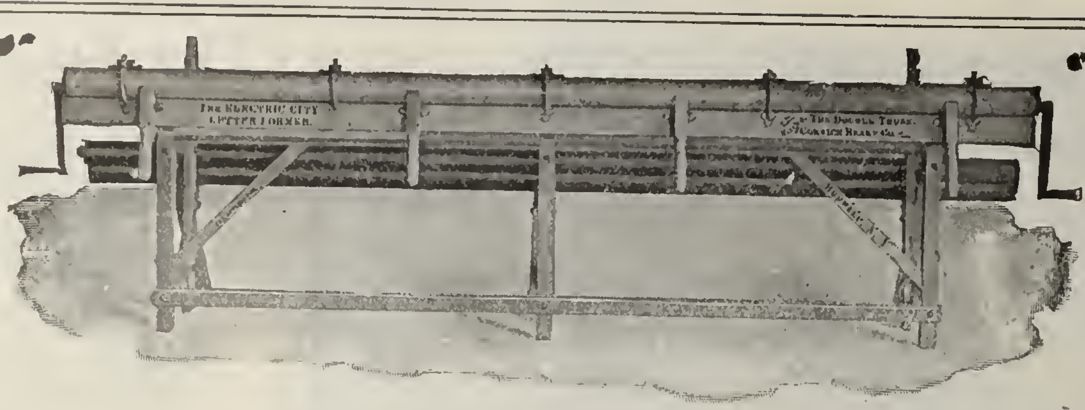
New In Principle.



THE ELECTRIC CITY GUTTER FORMER
THE DOUBLE TRUSS CORNICE BRAKE CO.

Unexcelled. 50 % Saved.

THE ELECTRIC CITY GUTTER FORMER.

The Electric City Gutter Former can be bought for 50 per cent. less than other machines intended for the same purpose.
This machine will do everything that can be accomplished by any other gutter former. No other machine can do better work. No other machine can do quicker work.
The principle of this machine is entirely different from any other. It is more practical. Both the bead and the gutter are formed in one continuous operation. You do not waste any time in hard work in getting the body of the gutter in proper shape. Every operation is mechanical. Each Length of gutter is formed exactly alike No other machine is as practical in its operation. No other machine will give as much satisfaction. The low price is very attractive. The machine will perfectly demonstrate our claims.
Ask us about it. We gladly furnish information and price on request.

THE DOUBLE TRUSS CORNICE BRAKE CO., - 1453 Niagara St., BUFFALO, N. Y.

Our Improved Double Truss Cornice Brake is the most practical machine of its kind in the market. Let us send you a description of its merits. Our "latest" has a double edge on front leaf for making *fine* members and corrugations.

96 inches long.

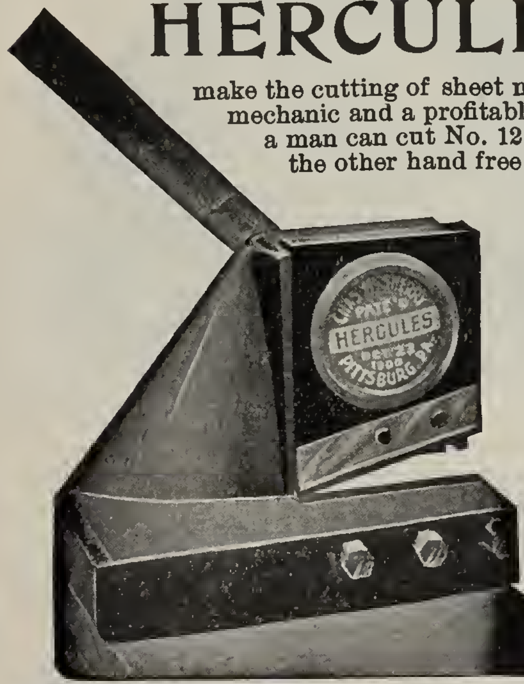
CORNICE MAKERS' SQUARING SHEARS.
With Lever Arc. Automatic Gauge. Will cut No. 2 iron.
97 inches long.

HERCULES SHEARS



make the cutting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cut No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or barsteel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.

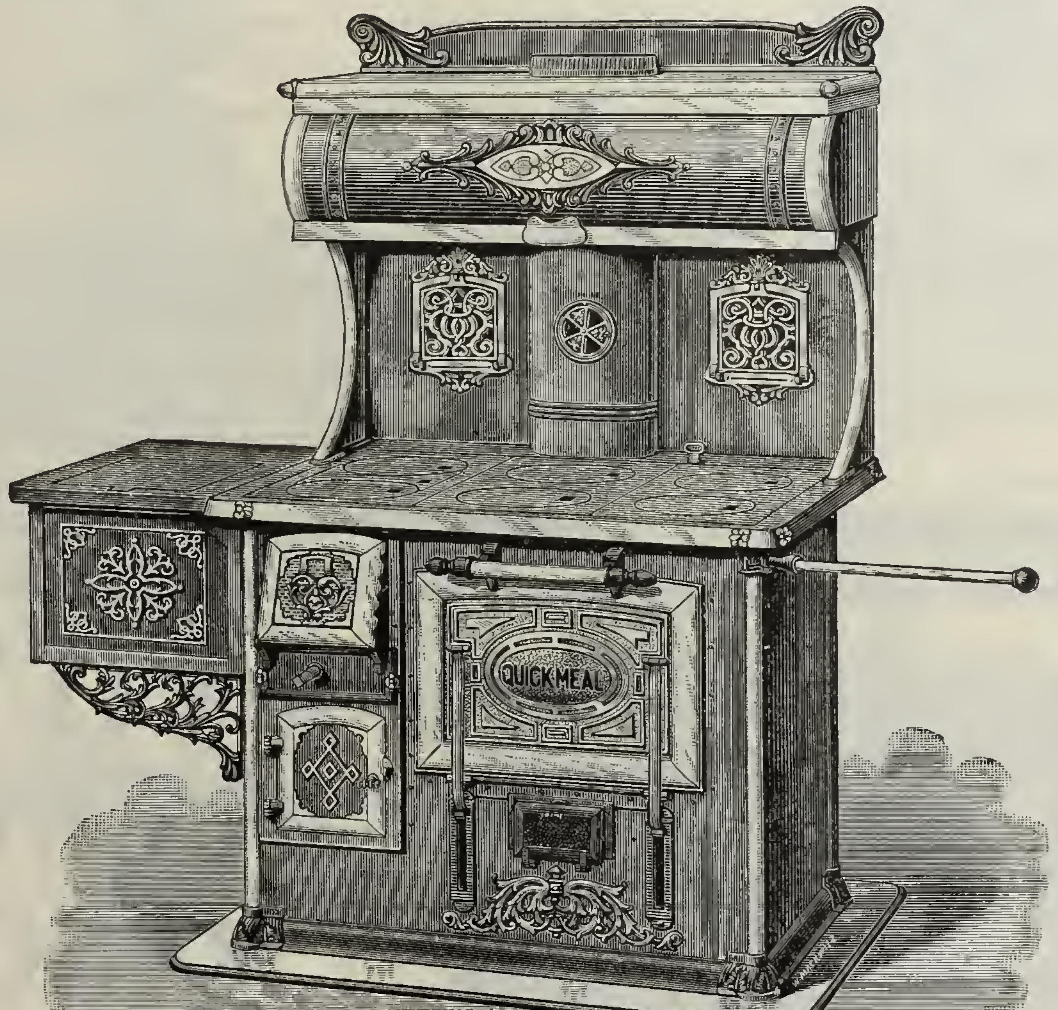
QUICK MEAL

STEEL RANGES



HAVE NEW HIGH SHELVES.

HAVE ATTRACTIVE HIGH CLOSETS.

In their new dress for 1902 are attractive and handsome. Their **High Closets** and **High Shelves** are entirely new in design. They are made entirely out of sheet steel, which makes them light and strong and gives them a neat and smooth finish, not found in the ordinary old style cast iron ornamentation.

You make friends when you handle " **Quick Meal** " Ranges.

PATENTED

Ask Yourself this Question:

Why should I not handle the Peck-Williamson Underfeed Furnace?

You will find it a hard question to answer.

And the more you look into the merits of the furnace, the harder it will be for you to answer it.

As a matter of fact, there is absolutely no reason why you should not be the one man in your town who handles the most sensible and logical furnace ever offered to the trade.

If you will speak quick and corral the agency for the Peck-Williamson Underfeed Furnace in your town, you will not only have the best furnace proposition in the world to offer to your customers, but we will give you a line of assistance that will simply give you the control of the furnace business in your section.

There are many things that furnace makers have tried for years to accomplish that have been achieved by the Peck-Williamson Underfeed Furnace, viz.:

A measurable saving in the cost of running a furnace.

A furnace that will burn the cheapest grades of fuel with no smoke, no soot, no clinkers and few ashes.

Above all, a furnace that will burn the minimum fuel and give the maximum amount of heat.

There is logic in feeding fresh coal into a furnace from underneath; it isn't a freakish idea.

The coal is consumed more slowly and the process results in the actual consumption of the smoke itself, thus utilizing every particle of every heat unit contained in the coal.

If you accept the agency and push this furnace, you will gain the everlasting ill-will of the coal men in your town; but they don't make much money for you, so why should you not handle the Peck-Williamson Underfeed Furnace?

A furnace like this needs little talk from you to convince your customer. It talks eloquently. It appeals to the good sense and economical side of every man who sees it.

Our Handsome Booklet Free.

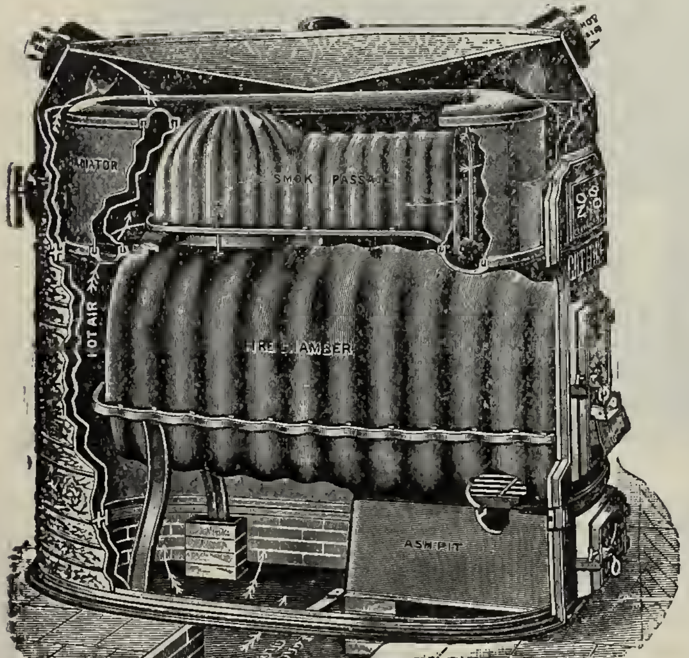
GILT EDGE



stands for best when applied to furnaces. The many dealers who have installed and the thousands of householders whose homes have been heated by our furnaces show they like the Gilt Edge, as will be seen by the testimonials they have written. Let us send you a few of them.

The Keystone Joint used in Gilt Edge Furnaces is the only permanent gas tight steel and cast iron joint on the market.

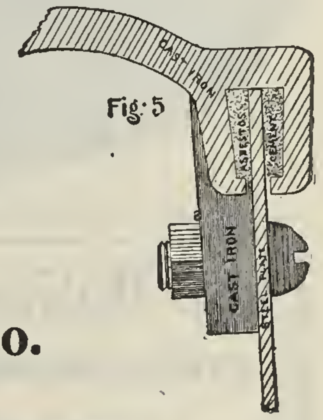


Fig. 5

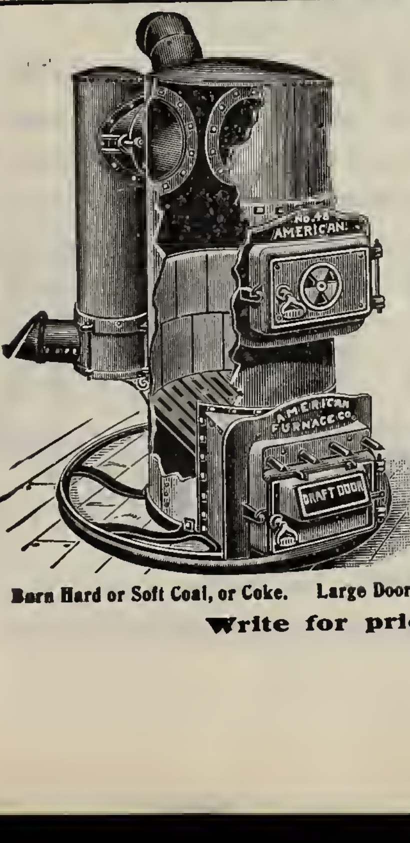
R. J. Schwab & Sons Co.

MILWAUKEE

About Fire Pots.



Burn Hard or Soft Coal, or Coke. Large Doors.

We formerly lined our fire pots with cast iron—then they cracked and warped. Now we use fire brick for lining and will guarantee it for five years. The lining is replaced through the fire door.

The **AMERICAN FURNACE** is made strong in places where other furnaces have proven weak; it is made of heavy steel and riveted tight like a boiler. Will burn any kind of fuel.

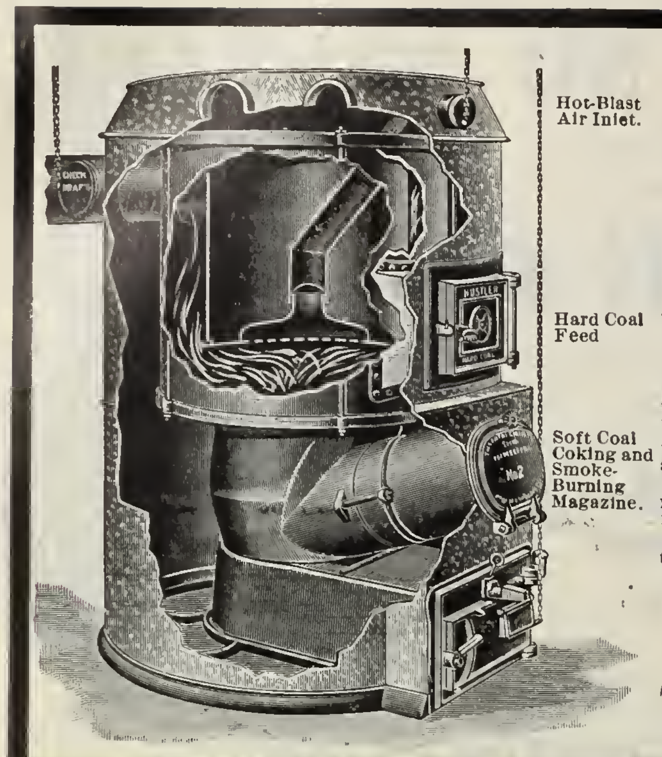
You can only build up a permanent furnace business by handling a first-class furnace. We manufacture for the better class of trade.

Large Radiators, easy to clean out.

The American Furnace Co.,

1911-13 PINE STREET, . ST. LOUIS, MO.

Write for prices and secure the agency before the other fellow gets it.



THE PATRIC FURNACE

Guaranteed to Burn Successfully

SOFT COAL, HARD COAL, COKE and WOOD.

SPECIAL FEATURES:

The **Coking and Smoke-Burning Magazine** used on the Patric Furnace has been a great success for twenty years. The prospective customer is attracted at once by this feature, and those who have used it are loudest in its praise. It cokes the soft coal, and burns largely the volatile parts of the smoke before the fuel enters the main fire bowl. Clinkers are easily removed through the magazine without disturbing the fire. The accessibility that this magazine affords for this and other purposes is worth much to the user.

A **separate feed door** is provided for hard coal or coke. Either one of these fuels may be used alone or soft coal may be used in the magazine with hard coal or coke in the main fire-bowl at the same time.

The **Hot-Blast** device used on the Patric Furnace is simple, effective in aiding combustion, and directs the flame to the surfaces where it will do the most good.

The **Material** used is of the best. All castings made in our own foundry.

SEND FOR NEW CATALOGUE AND PRICE LIST.

DIGHTON FURNACE CO., Taunton, Mass.

Dear Sirs:—The "Dighton" Furnace with Hot Water Combination Attachment which was installed in my residence a couple of years ago is very satisfactory in every way.

It requires very little care and uses less fuel than any furnace I have ever had any experience with.

Several of my friends now use the "Dighton," having bought through my recommendation, and they speak as highly of it as I do and recommend it especially for its economy of fuel.

Yours truly, M. H. SULLIVAN.

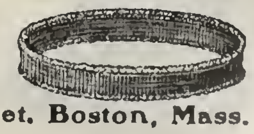
THE S. M. HOWES CO., 40, 42, 44, 46 Union Street, Boston, Mass.



IS IT SO?

A Tea-Kettle Boils Quicker on my Chimney than on my Stove.

It is said that a tea-kettle will boil quickest on top of a chimney. However that may be, all agree that there is too much heat wasted there. Nothing but the cross tube ***ROCHESTER RADIATOR*** has ever trapped it. If you were to heat a poker, would you hold it at the side of the flame or over the top? Or would you cook food on the side of a cook-stove in preference to the top? It is thus with the ***ROCHESTER RADIATOR***, which takes the heat from the top of the current and not from the side. The cross tubes cool the hot current, just as you would blow across a cup of tea to cool it, only there are from 96 to 120 such currents in operation.

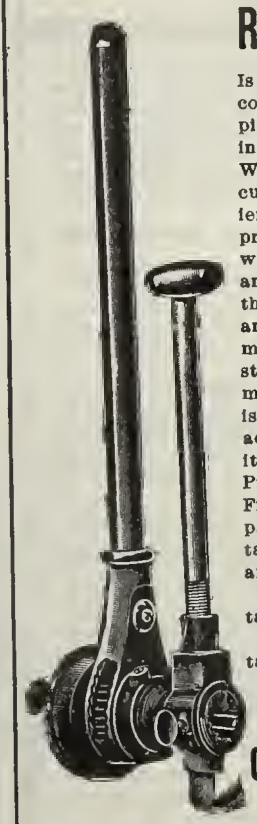
The Climax
RATCHET STOCK



Is an indispensable tool for conveniently threading iron pipe in ditches, under floors, in corners, over head, etc. With this tool threads can be cut without removing whole lengths of pipe. This tool is provided with a strong vise which securely grips the pipe and by means of the leading thread the die is forced on pipe and the thread is cut. It is made of malleable iron and steel, and while light in weight, making it convenient to carry, is very strong and rigid. The advantages of this tool make it absolutely indispensable to Plumbers, Steam and Gas Pipe Fitters, Gas and Water Companies, Machinists, etc. It takes standard size dies, which are extra if furnished.

No. 1 threads ¼ to 1 in. pipe, takes 2 or 2½ in. die, $10.00.

No. 2 threads 1 to 2 in. pipe, takes 2½, 3 and 4 in. die, $17.00.

ABOUT ESTIMATE BOOKS
For Plumbers and Heating Men

Your Contract and Estimate Record Book for Plumbers is one of the best books that ever came into our house and we would not be without it for three times the amount it cost. We can figure without omitting anything with accuracy at a very short time. We think that every plumber should not be without this valuable book.
W. C. BENNETT & CO., Haverhill, Mass.

We have used an estimate book for three years and could not do without one. Would say that yours is far superior to any yet used and can cheerfully recommend it.
W. R. PARK & SON, Taunton, Mass.

A great advantage. Prevents the leaving out of small items, which amount to more than the cost of the book in a very short time.
CHAS. W. COOMBS, Lawrence, Mass.

Your Contract and Estimate Record Book has been of great use to me in both the saving of money and labor, and I would highly recommend it to any or all master plumbers.
THOMAS P. DOHERTY, Taunton, Mass.

These testimonials are a few of many, and indicate both that a well arranged estimate book, which provides complete lists of items to be figured upon, is a time, labor and money saver, and that the *"CONTRACT AND ESTIMATE RECORD BOOKS"* come up to this requirement.

THE EDITIONS ARE AS FOLLOWS:

CONTRACT AND ESTIMATE RECORD BOOK FOR PLUMBERS

OFFICE EDITION.

200 Pages. Arranged for 100 Estimates. Size 8 x 11 inches. Cloth bound, $1.50
500 Pages. Arranged for 250 Estimates. Size 8 x 11 inches. Cloth bound, $2.50

POCKET EDITION.

200 Pages. Arranged for 50 Estimates. Size 3½ x 8 in. (oblong). Flexible cloth binding, $0.50

CONTRACT AND ESTIMATE RECORD BOOK FOR STEAM AND HOT WATER HEATING

200 Pages. Arranged for 100 Estimates. 7 x 12 inches. Cloth bound, $1.50

NOTE. The omission of one item in an estimate on a plumbing or heating job might result in the loss of all profit. These books provide a reliable, accurate, businesslike record, and a sure means of avoiding loss due to mistakes and omissions.

Sent prepaid on receipt of price.

Plumbing and House Drainage Problems.

244 Pages; 146 Illustrations; Size, 6 x 9½ inches. Cloth bound. Price, $1.50.

This volume is devoted to practical plumbing and house drainage, treating many of the most difficult problems arising in the practice. Much of the subject-matter is presented in the form of questions and answers. The answers, as a rule, consist of descriptions of methods of properly installing work, accompanied by appropriate illustrations, which make the text clear. Incorrect ways of doing work are also pointed out, accompanied by examples of successfully installed plumbing and drainage. **Hot water circulation and hot water supply in buildings** are treated at considerable length.

PART OF CONTENTS:

DANGEROUS BLUNDERS IN PLUMBING.

- Running Vent-Pipe in Improper Places — Connecting Soil-Pipes with Chimney-Flues—By-Passes in Trap-Ventilation, etc.
- A Case of Reckless Botching.
- A Stupid Multiplication of Traps.
- A Trap Made Useless by Improper Adjustment of Inlet and Outlet Pipes.
- Unreliability of Heated Flue as a Substitute for Proper Trapping.
- Need of Plans in Doing Plumbing-Work.

HOUSE-DRAINAGE.

- City and Country House-Drainage—Removal of Ground-Water from Houses — Trap-Ventilation — Fresh-Air Inlets—Drain-Ventilation by Heated Flues—Laying of Stoneware Drains.
- Requirements for the Drainage of Every House.
- Ground-Water Drainage of a Country House.
- Ground-Water Drainage of a City House.
- Fresh-Air Inlets.
- The Location of Fresh-Air Inlets in Cities.
- Air-Inlets on Drains.
- The Proper Way to Lay Stoneware Drains.
- The Tightness of Tile-Drains.
- Danger of Soil-Pipe Terminals Freezing unless Ends are without Hoods or Cowls.
- Objection to Connecting Bath-Waste with Water-Closet Trap.
- How to Adjust the Inlets and Outlets of Traps.
- How to Protect Trap when Soil-Pipe is used as a Leader.
- Size of Ventilating-Pipes for Traps.
- How to Prevent Condensation Filling Vent-Pipes.
- How to Prevent Accidental Discharge into Trap Vent-Pipe.
- Why Traps should be Vented.

MISCELLANEOUS.

- Syphoning Water through a Bath-Supply.
- Emptying a Trap by Capillary Attraction.
- As to Safety of Stop-Cocks on Hot Water Pipes.
- How to Burnish Wiped Joints.
- Admission to the New York Trade Schools.
- Irregular Water Supply.
- Hot Water from the Cold Faucet, and how to Prevent it.
- Disposal of Bath and Basin Waste Water.
- To Prevent Corrosion of Tank Lining.
- Number of Water Closets Required in a Factory.
- Size of Basin Wastes and Outlets.
- Tar Coated Water Pipe Affect Taste of Water.
- How to Heat a Bathing-Pool.
- Objections to Galvanized Sheet Iron Soil-Pipe.
- To Prevent Rust in a Suction Pipe.
- Automatic Shut-Off for Gas Pumping Engines, when Tank is Full.
- Paint to Protect Tank Linings.
- Size of Water-Pipes in a House.
- How to Make Rust Joints.
- Covering for Water-Pipes.
- Size of Soil-Pipe for an ordinary City House.
- Where to Place Burners to Ventilate Flues by Gas Jets.
- How to Prevent Water Hammer.
- Why a Hydraulic Ram does not Work.
- Proper Size of Water-Closet Outlets.
- Is a Cement Floor Impervious to Air?
- Two Traps to a Water Closet Objectionable.
- Connecting Bath-Wastes to Water-Closet Traps.
- Objections to Leaching Cesspool and Need of Fresh Air Inlet.
- The Theory of the Action of Field's Syphon.
- How to Disinfect a Cesspool.
- Slabs for Pantry Sinks—Wood *vs.* Marble.
- Test for Well Pollution.
- Corrosion of Lead Lining.
- Size of Flush Tank to Deal with Sewage of a Small Hospital
- Details of the Construction of a House-Tank.
- The Construction of a Cistern under a House.
- To Protect Lead Lining of a Tank, and Cause of Sweating.
- Stains on Marble.
- Lightning Strikes Soil-Pipes.
- How to Fit Sheet Lead in a Large Tank.
- Why Water is "Milky" When First Drawn.
- Carving-Tables.
- Is Galvanized Pipe Dangerous for Soft Spring Water?
- How to Arrange Hush Pipes in Cisterns to Prevent Syphoning Water Through Ball Cock.
- Depth of Foundations to Prevent Dampness of Site.
- Self-Acting Water Closets.
- Wind Disturbing Seal of Trap.
- How to Draw Water from a Deep Well.
- Cause of Smell of Well Water.
- Absorption of Light by Gas Globes.
- Fitting Basins to Marble Slabs.
- Intermediate Tanks for the Water Supply of High Buildings.
- How to Construct a Filtering Cistern.
- Objections to Running Ventilating Pipe into Chimney-Flue.
- Size of Water Supply Pipe for Dwelling House.
- Faulty Plan of a Cesspool.
- Disposing of Refrigerator Wastes.
- Pumping Air from Water Closet into Tea Kettle as Result of Direct Supply to Water Closets.
- Danger in Connecting Tank Overflows with Soil-Pipes.
- Arrangement of Safe Wastes.
- What is Reasonable Plumbers' Profit?

HOT WATER CIRCULATION IN BUILDINGS.

HOT WATER SUPPLY IN VARIOUS BUILDINGS.

Steam Heating Problems.

233 Pages; 109 Illustrations; Size, 6 x 9 inches. Cloth bound. Price, $1.50.

This book contains a compilation of questions, answers and descriptions relating to Steam Heating and Steam Fitting, expertly treated and adapted to the wants of those who design, construct and have charge of steam-heating apparatus. The work embodies results of some of the best experience and practice in the trade, presenting solutions of many difficult problems connected with the steam-fitter's work. We reproduce some of the subject-matter headings of Steam Heating Problems, which are of interest as indicating the practical character of the problems and questions which are treated.

BOILERS.

- On blowing off and filling boilers.
- Where a test-gauge should be applied to a boiler.
- Domes on boilers; whether they are necessary or not.
- Expansion of water in boilers.
- Cast *vs.* wrought iron for nozzles and magazines of house-heating boilers.
- Pipe-connections to boilers.
- Passing boiler-pipes through walls; how to prevent breakage by settlement.
- Heating-boilers. (A problem.)
- Isolating-valve for steam-main of boilers.
- On the effect of oil in boilers.
- Proportions for rivets for boiler-plates.
- Iron rivets and steel boiler-plates.
- Is there any danger in using water continuously in boilers?
- A supposed case of charring wood by steam-pipes.
- Domestic boilers warmed by steam.

VALUE OF HEATING-SURFACES.

- Computing the amount of radiator-surface for warming buildings by hot water.
- Calculating the radiating-surface for heating buildings—the saving of double-glazed windows.
- Amount of heating-surface required in hot-water apparatus boilers and in steam-apparatus boilers.
- Calculating the amount of radiating-surface for a given room.
- How much heating-surface will a steam-pipe of given size supply?
- Coils *vs.* radiators and size of boiler to heat a given building.
- Calculating the amount of heating-surface.
- Computing the cost of steam for warming.

RADIATORS AND HEATERS.

- Improper position of radiator-valves.
- Hot-water radiator for private houses.
- Remedying air-binding of box-coils.
- How to use a stove as a hot water heater.
- "Plane" *vs.* "Plain" as a term as applied to outside surface of radiators.
- Relative value of pipe on cast-iron heating surface.
- Relative value of pipe on steam-coils.
- Warming churches (plan of placing a coil in each pew).
- Warming churches.

PIPE AND FITTING.

- Steam-heating work—good and indifferent.
- Piping adjacent buildings: pumps *vs.* steam-traps.
- True diameters and weights of standard pipes.
- Expansion of pipes of various metals.
- Expansion of steam-pipes.
- Advantages claimed for overhead piping.
- Position of valves on steam-riser connection.
- Cause of noise in steam-pipes.
- One-pipe system of steam-heating.
- Air-binding in return steam-pipes.
- How to heat several adjacent buildings with a single apparatus.
- Air-binding in return steam-pipes, and methods to overcome it.

VENTILATION.

- Size of registers to heat certain rooms.
- Determining the size of hot-air flues.
- Window ventilation.
- Removing vapor from dye-house.
- Calculating sizes of flues and registers.
- On methods of removing air from between ceiling and roof of a church.

STEAM.

- Economy of using exhaust steam for heating.
- Heat of steam for different conditions.
- Superheating steam by the use of coils.
- Effect of using a small pipe for exhaust steam-heating.
- Explosion of a steam-table.

CUTTING NIPPLES AND BENDING PIPES.

RAISING WATER AUTOMATICALLY.

MOISTURE ON WALLS, ETC.

MISCELLANEOUS.

- Heating water in large tanks.
- Heating water for large institutions and high city buildings.
- Questions relating to water-tanks.
- On heating several buildings from one source.
- Coal-tar coating for water-pipe.
- Filters for feeding house boilers. Other means of clarifying water.
- Testing gas-pipes for leaks, and making pipe-joints.
- Differential rams for testing fittings and valves.
- Percentage of ashes in coal.
- Automatic pump-governor.
- Cast-iron safe for steam-radiators.
- Preventing fall of spray from steam-exhaust pipes.
- Heating and ventilation of a prison.
- Amount of heat due to condensation of water.
- Expansion-joints.
- Resetting of house-heating boilers—a possible saving of fuel.
- How to find the water-line of boilers and position of try-cocks.

MISCELLANEOUS QUESTIONS.

- Applying traps to gravity steam-apparatus.
- Connecting steam and return risers at their tops.
- Power used in running hydraulic elevators.
- On melting snow in the streets by steam.
- Arrangement of steam-coils for heating oil-stills.
- Converting a steam-apparatus into a hot-water apparatus and back again.
- Condensation per foot of steam-main when laid under ground.

These books will be sent postpaid on receipt of price, $1.50 per copy.

DAVID WILLIAMS COMPANY, Publishers, 232-238 William Street, New York.

Injunction Restraining the Use of the Name "Peck Brothers" by the Chicago Company.

As the trade has been caused some inconvenience by the use of the name "Peck Brothers" by the original company in Connecticut and a company in Chicago, the following decree, entered pursuant to the direction of the Circuit Court of Appeals for the Seventh Circuit, is published, that the real facts relating to the right to the name may be understood. Those who care for further information are referred to the opinion of the Circuit Court of Appeals in 113 Federal Reporter, 296.

THE PECK BROTHERS & COMPANY, New Haven. Conn.

UNITED STATES CIRCUIT COURT
FOR THE NORTHERN DISTRICT OF ILLINOIS.

THE PECK BROTHERS & CO.
of New Haven, Conn.,
vs.
PECK BROS. CO., *et al.*,
of Chicago.

Decree.
Gen. No. 25,574.

This cause came on to be further heard at this term of the Court upon the pleadings, evidence, depositions, exhibits and proofs and the former orders and decrees herein, and also upon the Mandate of the United States Circuit Court of Appeals in this cause duly issued on the 24th day of April, 1902, and filed herein, whereby the former decree entered in this cause on the 8th day of July, 1901, was wholly reversed, set aside and annulled, and said cause was remanded to this Court with directions to enter a decree according to the prayer of the bill of the said complainants. And the said cause having been argued by counsel, and thereupon, upon consideration thereof:

It is Ordered, Adjudged and Decreed, That the said complainant has the sole, absolute, paramount and exclusive right to use the name of "Peck Brothers & Co.," or "Peck Bros. Co.," or "Peck Bros.," or the name of "Peck" in connection with the business which it is carrying on and conducting in the manufacture, purchase and sale of plumbing, gas and steam fitting machinery, material and supplies, and brass and iron goods as against the said defendants; and that neither the said defendant corporation, "Peck Bros. Co.," nor the defendants, Oliver D. Peck, James H. Johnson, William A. Ratcliffe and Albert D. Sanders, as its directors and managers, have any right or authority to use the name of "Peck Brothers & Co.," or "Peck Bros. Co.," or "Peck Bros.," or the name of "Peck" or any words substantially identical therewith, in connection with the business which said defendants have carried on and conducted under the said name and style of "Peck Bros. Co." since the 24th day of August, 1896, in the manufacture, purchase and sale of plumbing, gas, steam fitting machinery, material and supplies and brass and iron goods. And the Court further finds that the said defendant, "Peck Bros. Co.," and the said defendants, Oliver D. Peck, James H. Johnson, William A. Ratcliffe and Albert D. Sanders, as its directors and managers, have heretofore and are now wrongfully and fraudulently using the said name of "Peck Bros. Co." in carrying on and conducting the said business of the manufacture, purchase and sale of plumbing, gas and steam fitting material, supplies, fixtures and brass and iron goods in Chicago and elsewhere. It is further ordered and decreed by the Court that the said defendant corporation, "Peck Bros. Co.," and the said defendants, Oliver D. Peck, James H. Johnson, William A. Ratcliffe and Albert D. Sanders, as its officers and directors, be and they are hereby each of them perpetually enjoined and restrained from using said name of "Peck Brothers & Co.," or "Peck Bros. Co.," or "Peck Brothers" or "Peck," or names substantially identical therewith, in connection with the business of the manufacture, purchase and sale of plumbing, gas and steam fitting material, supplies, fixtures, brass and iron goods in any manner whatever, or from stamping or marking said names or any of them, or any name substantially identical therewith, upon any goods or articles manufactured by them; or from selling or offering for sale by themselves or their agents any goods manufactured by them having stamped thereon any of the names aforesaid; or from using said names or any of them in connection with the said business of said defendant corporation, "Peck Bros. Co.;" or advertising the business of said defendant, "Peck Bros. Co.," under the said names or any of them, and also from holding out or representing that the goods manufactured by thc defendant corporation of "Peck Bros. Co." and its said directors and managers, Oliver D. Peck, James H. Johnson, William A. Ratcliffe and Albert D. Sanders, are the same goods as those manufactured by the complainant, and from using or interfering in any manner whatever with the prior and paramount right of the complainant to use the name of "Peck Brothers & Company" or "Peck Bros. Co." or "Peck Bros." or "Peck" in connection with the business of the manufacture, purchase and sale of plumbing, gas and steam fitting material, supplies and brass and iron goods.

It is, however, further ordered by the Court that nothing in this decree shall be construed or held as enjoining or preventing the defendant Oliver D. Peck from using his own name as an individual in and about the conduct of his business.

And it further appearing to the Court that the said defendant corporation, "Peck Bros. Co.," and the said defendants, Oliver D. Peck, James H. Johnson, William A. Ratcliffe and Albert D. Sanders, as its directors and officers, have carried on business under the name of "Peck Bros. Co." since the filing of the bill herein fraudulently and without authority:

It is further ordered by the Court that this cause be referred to William M. Booth, one of the Masters in Chancery of this Court, to take an account of the gains and profits, if any, which have been made and received by the defendant corporation, "Peck Bros. Co.," and the said defendants, Oliver D. Peck, James H. Johnson, William A. Ratcliffe and Albert D. Sanders, as its directors and managers, from the time of filing the bill in this case down to the date of the entry of this decree. The said Master in Chancery is hereby directed to receive and consider the evidence, depositions, exhibits and proofs hereinbefore offered in this case and to take further evidence in this behalf. And it is further decreed by the Court that the said defendant corporation, "Peck Bros. Co.," and the defendants, Oliver D. Peck, James H. Johnson, William A. Ratcliffe and Albert D. Sanders, its directors and officers, do appear before said Master in Chancery when and where they may be required, and that they be ordered to produce before the said Master the books of said corporation or such of them as may be reasonably required from time to time by said Master for the purpose of showing said gains of the said defendant, "Peck Bros. Co.," by reason of using its said name in connection with its business; that said books be opened for inspection at all reasonable times to the counsel of the said complainant or such persons as he may employ to examine the same with the view of ascertaining said gains and profits, and that the said defendants, Oliver D. Peck, James H. Johnson, William A. Ratcliffe and Albert D. Sanders, and each of them, are hereby ordered to submit to examination under oath before said Master with regard to the gains and profits which said defendant corporation has made and received by reason of the use of said name.

And it is Further Ordered, That the said parties to this cause have leave to apply to the Court from time to time during said accounting for further orders and instructions in that behalf, and that the said Master make his report of said gains and profits with all convenient speed.

And it is Further Ordered, That the said complainant recover from the defendant its costs in this behalf, for which execution may issue.

Kohlsaat, J.

Entered June 4, 1902.

The Kelsey Warm Air Generator.

A HEATING APPARATUS with from nine to seventeen vertical corrugated cast iron flues, or Sections, forming the Fire Cylinder and Combustion Chamber, and having 65 square feet of heating surface to each square foot of grate surface.

Warms thoroughly and to the proper temperature great volumes of air, by passing it through the flues, and conveys it to every part of the building.

Provides heat and most perfect ventilation for Residences, Churches and School Buildings.

Accomplishes results which lead to further sales at satisfactory profits for the dealer.

Send for 164 Page Book of "Opinions." 20,000 in use.

The Master Plumbers' Convention.

The large attendance at the annual convention of the National Association of Master Plumbers, held at Atlantic City last week, was an agreeable surprise to all concerned. The indications presented earlier in the month that the convention would be a record breaker in point of numbers were completely fulfilled. The number of delegates reached the handsome total of five hundred and forty-four, which was eighty-nine more than the highest record of the past. The California contingent, it may be noted, did not appear surprised, but expressed the belief that when the convention meets next year on the Pacific Coast even this record will be surpassed. Probably it was not interest in the work of the National Association alone, but also the desire of many from the interior of the country to see the sights on the Atlantic Coast that brought so large a number of delegates from the West. It is confidently expected that now the convention has voted to meet next year in California many plumbers will begin making preparations at this early date to avail themselves of the especially low rates made by the railroad companies in order to enjoy a view of the attractions of the Pacific Coast. Notwithstanding the large number in attendance, the business part of the convention was satisfactorily completed. There is no room for doubt that a strong feeling exists on the part of the plumbers that too much is not demanded in the Cleveland Resolutions. While appreciating the sacrifice of time and labor that must be made by President Hornbrook, his reelection with that of the rest of the national officers and the appointment of the same Executive Committee, with one exception, was undoubtedly made for the purpose of giving to the Cleveland Resolutions the vigorous support to which the delegates and the local associations feel they are entitled. That President Hornbrook was reluctant, notwithstanding the honor of a re-election, to continue to carry the burdens that go with the office of the national executive was very evident, and it was only when the unanimous feeling that his re-election was necessary was made clear that he finally allowed his name to be used. The association is to be congratulated on having transacted the business of this national convention in a satisfactory manner, and in the re-election of officers who so highly merit the confidence reposed in them.

To Promote Export Trade.

The announcement of the incorporation of the Export Club of America, a new business and social organization which has just taken possession of quarters in the Tontine Building, Wall and Water streets, New York City, is an illustration of the intelligent and enterprising spirit in which our merchants and manufacturers are reaching out for foreign trade. It is another indication that this country is thoroughly in earnest in seeking to extend its commercial relations with the world at large. From a statement made in regard to the lines on which the club proposes to prosecute the work of promoting the sale abroad of American products, it is evident that the diffusion of information holds an important place. The club will aim to give foreign houses who desire American goods advices as to the parties from whom they may be advantageously obtained, calling their attention, primarily at least, to such manufacturers as are members of the club, a feature of which is calculated to attract manufacturers to the organization. The rooms of the club have been furnished with all modern conveniences, including files for catalogues and price-lists and other interesting matter pertaining to American manufactures. Among the charter members are found manufacturers, merchants and sales agents, as well as lawyers, engineers and financiers. One direct effect of the effort will apparently be to bring the foreign houses and the American makers of goods into close relationship, a matter which on general principles is very desirable. This feature of the plan, however, will possibly be regarded with disfavor by some of the commission houses, who are reluctant to have their customers brought into direct contact with the manufacturers in this country. But many of the more progressive and successful commission houses take a broader view of the question and are disposed to welcome any influence which diffuses information in regard to facilities here for the supply of foreign markets. The need of the dissemination of such information in Spanish-American countries is especially urgent, and as this is a field to which the Export Club is primarily and principally turning its attention, whatever aid they may give in bringing the products of our manufacturers to the notice of buyers in those countries will be regarded as a substantial contribution to the good work of occupying the world's markets. The club, however, is something of an experiment, and its operation and development will be watched with interest.

Saturday Early Closing.

The custom of early closing on Saturdays in the summer, the observance of which has been growing steadily among business concerns in the past few years, seems now to have become an almost general rule. Practically all the large wholesale and retail establishments in New York City are now closing at noon, or 1 p.m. on Saturdays, and at 5 o'clock on the other days of the week during the summer months. Moreover, the term during which the early closing is observed has in many cases become extended. Whereas, formerly, this was done only in the months of July and August, which are regarded as the heated term in the United States, many concerns now close on Saturday afternoons from the first of June to the end of September. The wide adoption of this laudable practice is an indication that employers in general appreciate the fact that they lose nothing by giving to their employees during the trying summer months an opportunity of refreshment and rest, which enables them to perform their duties during the balance of the week with increased strength and energy. Where such a practice has become general the dread of losing business to competitors who do not close is removed; and this is about the only ground upon which any business need be kept open on Saturday afternoons in the summer. One or two large New York retail concerns are this year trying the experiment of closing down for the whole day during the months of July and August, thus enabling their employees to go to the country or the seaside on Friday night and secure two entire days of recreation and fresh air. The human machine is so constituted that such periods of rest during the heat of summer are absolutely essential to keeping it in proper shape for doing good work. As in the workshop, it is a short sighted policy that will drive a machine to death. A further advance along this line of Saturday vacations is seen in the increasing number of business houses that are beginning to close early on that day all the year round. This is especially noticeable in the downtown business district of New York City, where such notices as "This store (or office) will close at three P. M. on Saturdays," and so forth, are now quite common.

Plan for Government Arbitration.

Instigated thereto by the present strike in the coal mining industry, Representative McDermott of New Jersey has prepared, for presentation to Congress, a bill to authorize the appointment of boards of investigation and arbitration, for the purpose of adjusting labor disputes. The bill authorizes the President, when informed by petition or otherwise of the existence of a strike, to appoint a board of investigation and arbitration, to be composed of seven members, of whom one shall be selected by the employers and one by the employees. The commission is empowered to investigate and obtain a comprehensive account of the matters in dispute, and it is provided that the opinion of each member of the board upon the justice of the demand of each party to the dispute, shall be made to the President. Upon submission of any matter in dispute, as authorized by the bill, the board will consider the testimony offered by the parties and give judgment upon all matters submitted. Every such board will terminate its life upon the filing of its report upon the matter referred to it. Under the Constitution the Federal Government has no power to cause arbitration of purely local labor disputes in the different States; but Mr. McDermott believes that the Constitution is broad enough in the delegation of authority to Congress and the Executive to permit of investigation and to provide a court of arbitration in any matter that affects commerce between the States, such as the present coal strike, which seriously affects business interests in all parts of the country.

Sheet Metal Workers Busy.

The active demand prevailing for sheet metal, whether bright or terne plates, black or galvanized sheet iron, affords evidence that the sheet metal workers throughout the country are well occupied. Notwithstanding that most of the tinware now used is factory made, the tinsmith still has occasion to work up a considerable amount of bright plate to meet the requirements of his various customers, and the tin roofer, while called upon to compete with many kinds of roofing material, still finds that where slate or tiles are used on buildings, no small amount of tin plate for valleys and gutters is in demand by the builders. It is also worthy of note that the higher grade heavily coated roofing plates are in especially good demand. The increased use of black and galvanized corrugated sheet iron for both the side walls and roofs of warehouses and factory buildings has kept well occupied those who make a specialty of erecting such work. In cities where massive ornamental cornices are used as a finish on large buildings the sheet iron cornice has almost entirely superseded cornices of wood, stone or other material, and the demand in this branch of trade is constantly increasing. A further evidence of the gratifying condition of activity prevailing in the sheet metal working industry is the fact that the demand for skilled workmen in this branch of trade is in excess of the supply. Probably no line of business in which our readers are interested presents so satisfactory a condition all around as the sheet metal working industry at the present time.

STATISTICS OF IRON AND STEEL PRODUCTION IN 1901.

James M. Swank, general manager of the American Iron and Steel Association, Philadelphia, has just issued his annual statistical report, giving the complete statistics of iron and steel production in the United States and Canada in 1901, also statistics of the world's iron and steel production in 1899 and 1900. The report just issued shows an improvement on its predecessors, in giving greater details relative to some products, notably pig iron, which is separated into the various grades.

Twenty States made pig iron in 1901, against 21 in 1899 and 1900. The total production of pig iron in 1901 was 15,878,354 gross tons, against 13,789,242 tons in 1900, 13,620,703 tons in 1899, 11,773,934 tons in 1898 and 9,652,680 tons in 1897. The production in 1901 was 2,089,112 tons more than in 1900. Of the 1901 production 9,589,936 tons was Bessemer and low phosphorus pig iron, 1,448,850 tons was basic pig iron, 3,186,348 tons foundry pig iron and 639,184 tons forge pig iron, the balance being made up of malleable Bessemer, charcoal, white and mottled, spiegeleisen and ferromanganese grades. Pennsylvania, as usual, produced the largest output of pig iron, being credited with a total of 7,342,257 tons, Ohio coming next with 3,325,425 tons, Illinois third with 1,596,850 tons and Alabama fourth with 1,225,212 tons.

The total production of Bessemer steel in 1901 is given at 8,713,302 tons, as compared with 6,684,770 tons in 1900, an increase of about 25 per cent.

The total production of open hearth steel in the United States in 1901 was 4,656,309 gross tons, against 3,398,135 tons in 1900, an increase of over 37 per cent. The production of open hearth steel has more than doubled in the last four years.

The production of all kinds of steel ingots and castings in the United States in 1901 reached a total of 13,473,595 tons, as against a total of 10,188,329 tons in 1900.

The total production of all kinds of steel rails in 1901 was 2,874,639 gross tons, as compared with 2,385,682 tons in 1900.

The production of iron and steel wire rods in the United States in 1901 amounted to 1,365,934 gross tons, against 846,291 tons in 1900, showing an increase of over 61 per cent. Of the total only 375 tons were iron rods, the rest being steel.

The total production of all kinds of iron and steel rolled into finished forms in the United States in 1901 is placed at 12,349,327 gross tons, as against 9,487,443 tons in 1900. This total includes iron and steel rails, bars, hoops, skelp and shapes, wire rods, plates and sheets and cut nails.

A killing frost in the Platte Valley of Nebraska this week reflects the possibilities of midsummer weather in this great Republic.

Stove Costs Advancing.

The conditions prevailing in the iron trade are of a character to impart greater stiffness to the price of stoves. Pig iron has again advanced all along the line during the past week. Taking No. 2 Southern foundry pig iron, at Cincinnati, as a basis of comparison, it is to be noted that the price of this standard grade, so largely used by stove founders, is now $21.25 per ton, as compared with $13 at the corresponding time last year. This is an advance of fully 55 per cent. Other iron centers throughout the country show about the same relative change in price. This, however, applies only to pig iron available for delivery some months hence, say in the last quarter of the year. Foundrymen who for any reason are compelled to purchase iron for prompt shipment may have to pay a premium of from $1 to $2 or even more for what they can pick up and be thankful that they can get it. Pig iron has not been so scarce for many years as this summer. Furnacemen usually carry some stocks at their furnaces from which they can supply urgent necessities of their customers. But for months the demand has been so heavy, in spite of the large production of iron, that stocks at furnaces have completely disappeared. It may be alleged that this does not affect many stove manufacturers, as they are in the habit of placing orders far in advance of their requirements so as to be sure to have iron when they need it. But these orders are not being filled to their satisfaction, as the furnace companies have sold their maximum output, and whenever an accident interferes with the regular operations of their furnaces they have no iron to ship. This happens so frequently that consumers are kept in hot water by slow deliveries on their contracts. The strike in the anthracite coal regions has caused a number of Eastern furnaces to bank or blow out, and their customers are obliged to look elsewhere for a supply of iron to meet their immediate wants. For the first time in many years pig iron is being imported in considerable quantities to help out the domestic supply. But this does not aid the foundryman in the matter of cost, as the imported iron is being sold at high prices. Coal, coke, bolts and other essentials in the production of stoves are likewise much higher than at the corresponding time last year.

The advance in the price of stoves thus far made this year, amounting in the most extreme instances to 10 per cent., covers only a small part of the increased cost. It will be remembered that on April 1 an advance of 5 per cent. was made in molders' wages, and advances have also been made on other classes of labor. Thus the advance in stove prices has little more than covered the higher rates paid to workmen in stove factories. Under the circumstances it is not surprising that the advisability of another substantial advance in stove prices is being agitated among the manufacturers. Indications are strong that high prices for iron will prevail throughout this year and the opening months of next year. Stoves sold on the basis of costs prevailing in the early part of this year will have to be replaced by others costing much more, and a prudent manufacturer cannot help seeing that such a policy means a serious loss to him. Prospects favor a very heavy stove trade this fall, and those who are agitating for higher prices desire action to be taken in time to secure practical benefit from the fall trade. Otherwise, the bigger the trade the worse will it be for manufacturers.

THE MINNESOTA STOVE COMPANY, Shakopee, Minn., are sending out a four-page folder, calling attention to their Steel Coral and Crown Coral Steel Ranges, which they manufacture in the usual modifications. The bodies and ovens are exceptionally strong, being constructed of extra heavy cold rolled steel, closely riveted and braced so that they cannot warp from the heat, nor are they likely to bend in transportation. The wearing parts are lined with heavy asbestos, which is again protected with either cast or sheet metal plates. The fire box is oval in shape, heavily lined and well ventilated, and is fitted with a duplex grate which can be removed through the drop door in the front. The feed door is of the combination type for coal or wood. The back flue has a cast iron base, and the water front is of large capacity and tested to 300 pounds pressure. The ovens are ventilated, and the oven doors are provided with friction springs which prevent dropping. The reservoirs are enameled on cast iron, and are provided with extra galvanized iron lining between the reservoir and the outside sheet.

Why Are Not Stoves Higher?

We have received the following communication from a manufacturer who does not hesitate to write as he thinks, and who asks questions which he would undoubtedly like to have his fellow manufacturers answer:

There is no industry akin to the stove trade, the selling price of whose product in proportion to its cost is not from 25 to 50 per cent. higher than the selling price of stoves. That is, a man in some other industry who would put the same cost that is put into a stove would get from 25 to 50 per cent. more for the article. And why is it? Is it because so few manufacturers have enough backbone to get a fair compensation for their cost and labor? Or is it because the large stove manufacturer is compelled to sell his goods at the same price as the little founder who runs a small local shop, has not half the capital and does only a local business? In other trades such little manufacturers are not recognized as the ones who guide and make the prices. In other kindred industries manufacturers do not seem to go about with a searchlight hunting an excuse to lower prices. On the contrary they seem to use this light to try to find the means of giving to their business some plan, shape and form by which, while they serve the public well, they also serve themselves, too, and get as much for their goods as such high cost goods should bring.

The present cost of stoves, compared with the present cost of many other staple iron products, would warrant stoves bringing from 10 to 20 per cent. higher prices than they do. But is it fear, jealousy, or what is it that keeps them down? They should bring more money, and they would if the stove business generally was as intelligently managed as many other lines which have not one-half the capital invested. The stove buyer would not object to paying the manufacturer a higher price if he could only rest assured that he was as well and fairly treated as any of his neighbor retailers buying from other equally large manufacturers. The retailer does not consider every little corner store his competitor, and thereby he saves his own profits. He knows who his competitor is, and whether he is one of his own standing and equal caliber. It is there that the retailer can show the more aristocratic manufacturer a thing or two in getting a fair compensation for the cost he puts into his goods. The retailer knows who is his competitor and does not recognize every idiot as such.

Coal, iron, coke, putty, bolts, nickel solutions, labor and all else going in to the make up of a stove are very much higher. Some items are up 50 per cent. Therefore stoves should be higher. But they have not reached the level of the advances on the materials which go into the goods. The manufacturer seems to be blind to the fact that he must recognize that every other thing he buys, outside of what he uses to make his goods, has advanced—meat, lumber, clothes, rent, insurance, and so on all along the line. His living, as well as his manufacturing expenses, have advanced, so why on earth do not stoves advance more than they do?

The retail dealers are getting the benefit and what fun there is in it. The public do not get so much out of it, for the retailer gets all that his goods will stand and figures them always at the advance he would pay for his next goods. Retailers will not be slow to load up the manufacturer with all the orders he will book for goods for this season, and even for next, at present low prices, wherever they can find the manufacturer willing to book such orders. And why should he do it; and why is he doing it? Because he knows that stoves ought to be higher. C. B. E.

THE FURNACEMAN'S CREED REVISION.

BY W. R. M.

The gospel of fresh air—that is, the securing of the exhaust from every room—is being proclaimed by heating and ventilating engineers, by National and State authority and by an army of graduates from the technological institutes who are destined to revolutionize the usual methods of installation. This is *ipse dixit*, and should be accepted without dissent, because the furnace is elevated to a higher degree of usefulness, its scope of operation expanded and a pleasant sequence of increased profits is in perspective.

The natural function of the furnace is distribution of air, while with steam and hot water systems, air distribution by a system of air inlets and air outlets is supplementary with extra cost. It is therefore clear that the natural distributer, the furnace, now having air inlets, may add air outlets to its function at small cost. Whatever else in the heating trade may drop out of line when the "electrical millennium" arrives, the furnace is bound to remain, notwithstanding that Professor Dolbear, in his book "Matter, Ether and Motion," says: "But if ever electricity is obtained directly from combustion in an economical way, as there is some reason for thinking possible, electric heaters will displace stoves and the common furnace in the house."

Now, we do not take issue with the professor as to the common furnace; but, self preservation being the first law of nature, we cannot exist without our wind. We change our furnace to meet the new conditions, and when electricity from combustion is achieved, as it soon will be, its logical situation will primarily be in the combustion chamber of a heat source and, so far as the furnace is concerned, the combustion chamber will continue to be the source of energy.

The furnace is bound to remain; but it is equally bound to be changed to meet new conditions. And there is no other system so susceptible to important improvement as the furnace system, for by it air circuits are easily operated and from it will come the "wireless system of electrical heating and ventilation" for the twentieth century.

Death of William B. Betts.

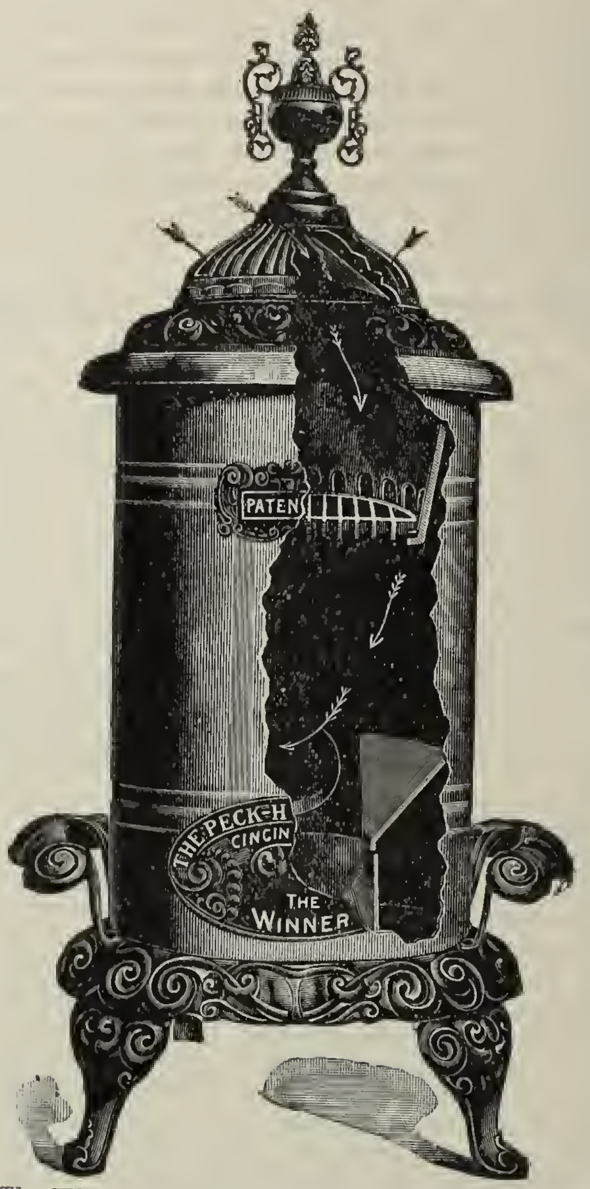
In our last issue brief announcement was made of the sudden death of William B. Betts, for many years manager of the Stove Manufacturers' Repair Association in Water street, New York City. For some time Mr. Betts had not been in very good health, and although this was generally known by a wide circle of friends in the trade, his death came as a decided shock. There is, however, consolation in the fact that he passed away very peacefully, his death occurring at the residence of his son in Summit, N. J., on Thursday, June 19, in the sixty-fourth year of his age. At the time of his death he was seated in a chair reading a newspaper preparatory to going for a drive.

"Billy" Betts, as he was popularly known in the local stove trade, previous to his management of the Manufacturers' Repair Association was at various times connected with the houses of Eugene Munsell & Co., the Barstow Stove Company, Ely & Ramsay and the Union Stove Works, and for a time was in business for himself. He was universally esteemed for his sterling qualities, and enjoyed the friendship of a wide circle of business acquaintances. He was a native of Danbury, Conn., a veteran of the Civil War, a past master of the George C. Strong Post, G. A. R., and a member of the Brooklyn Masonic Veterans. The funeral was held from his late home in Brooklyn on Saturday, June 21. He leaves a widow and one son.

UNDER date of June 20 Southard, Robertson & Co. Water street and Peck slip, New York City, issued an announcement withdrawing all previous and current quotations, owing to the increased cost of production in the manufacture of Stoves and Ranges. An advance of 5 per cent. was made on that date, and it was stated that all quotations are subject to further change without notice.

The Winner Down Draft Oak Stove.

We present herewith a broken view of what is known as the Winner patented down draft oak stove, which is being manufactured by the Peck-Hammond Company of Cincinnati, Ohio. The construction is such as to permit of the burning of any kind of fuel, and the claim is made that the stove readily holds fire over night. The fire pot is at the top of the stove and the smoke pipe at the base, so that the heat is drawn toward the floor. It has a large ash drawer, which does away with dust and dirt in removing ashes, and the company regard it as a most economical stove, as it utilizes more of the fuel than is ordinarily the case. The stove is meeting with a very gratifying reception at the hands of the trade, and the company regard the sales since its introduction as more than realizing expectations.



The Winner Down Draft Oak Stove.—Broken View.

The Improved Quick Meal Range of 1902.

In bringing out the new range for this season the Ringen Stove Company, division of the American Stove Company, St. Louis, take pride in calling attention to a number of details of improvement and attractiveness in the Quick Meal range. The new high closets are now made entirely of steel and the brackets and frame construction of the closets are of tube construction the same as the entire corner construction of the range. This, it is said, makes the range light and strong and adds greatly to its general handsome appearance. The front edge of the top of the range is nickel plated, and a new towel bar, which swings out of the way when not in use, is added. The Quick Meal range is made in all shapes and with either right or left hand reservoir and with or without pouch feed, high closet or high shelves. Two distinct lines of finish can be supplied, one polished steel and the other of black enamel, and it is claimed that either of these will stand at the head in point of excellence.

Windsor Ranges and Standard Furnaces.

Bartlett, Hayward & Co., Scott and McHenry streets, Baltimore, Md., have just issued a 1902 supplement to their stove catalogue, illustrating and describing the new patterns which they have added to the line of Windsor ranges and Standard furnaces. The new ranges are made in portable form as well as for brick setting and with five or six boiler holes in the top surface, according to requirements. They are furnished with fire box at the right or left of the oven, with vertical or horizontal boilers, with or without upper and lower hot closets, together with other features of obvious convenience and utility. The New Windsor is made in several styles and sizes, and has an exterior of attractive design. In connection with the various illustrations, dimensions, prices and brief descriptive particulars are presented.

The Standard furnace, which the company have added to their line, has a 60-inch casing, and is furnished with or without cast base. In the construction of the radiator the aim has been to secure the greatest amount obtainable of heating surface, and the company feel that they have accomplished this result in the addition of the center drum to the four-sheet radiator. The products of combustion pass from the fire chamber to the inner radiator through four ports in the crab. The outlet from the inner to the outer radiator being at the front the products of combustion are necessarily drawn to the front, by which method they are brought into contact with every inch of metal in the four-sheet radiator and center drum before passing to the smoke flue. The four ports in the crab leading into the bottom of the radiator give an equalized draft, by which a uniform distribution of heat from the radiator is obtained, and compelling the furnace to heat at the front as well as at the back. The fire pot, on account of its weight and size, is made in two parts. The grate is of the rocking pattern, the mechanism being simple and durable.

The March-Brownback Stove Company.

The new stove catalogue, substantially bound in board covers, which has just been issued by the March-Brownback Stove Company, Pottstown, Pa., is a volume likely to interest a large class of dealers. It is made up of 126 pages of letter press, profusely illustrated with well executed engravings, showing an extensive and more than ordinarily attractive assortment of ranges and heaters. The volume is known as Catalogue No. 54. The company request the recipient not to mutilate the book, and say that if a circular of any particular stove is desired they will gladly furnish it upon application. Their assortment of ranges they regard as so complete that they have not deemed it necessary or advisable to get out any new patterns this season. The goods represent the results of knowledge derived from 54 years' experience in range construction, and are regarded as first-class in all respects.

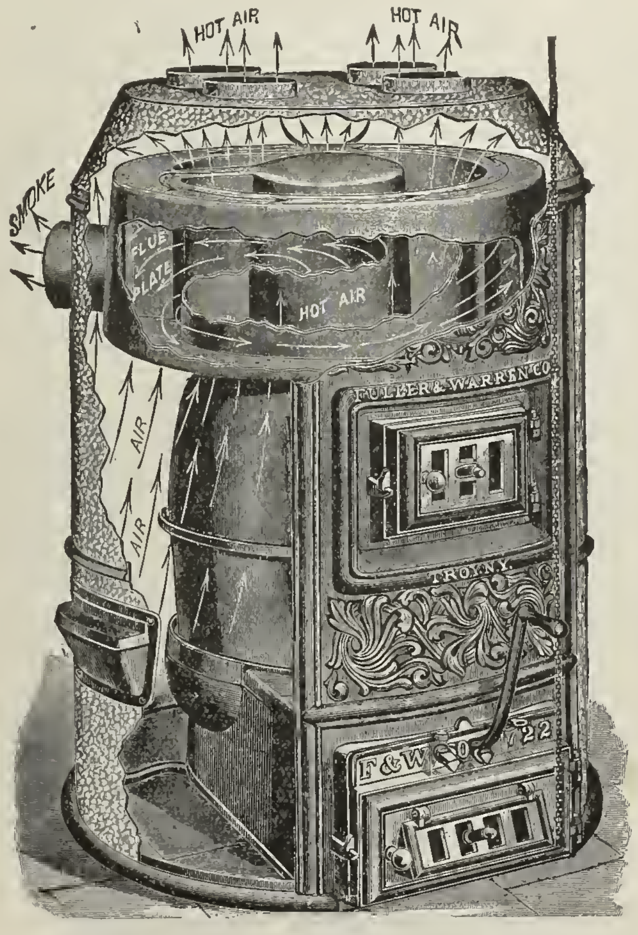
The ranges are offered for the most part under the generic name Globe, with such prefixes as Electric, New Victor, Rival Victor, New Welcome, Expert Welcome, New Prize and Prize, for burning coal or wood. All these are fitted with duplex grate, and are offered in a number of styles and sizes. The external treatment is rich and effective, cast ornamentation constituting a conspicuous feature. Other goods include the Prize, Expert, Congress, Herald, World, Clara Barton, Climax and Tropic ranges.

Several pages are devoted to warming closets and pipe shelves, after which heating stoves are considered. The leading place is given to the Bright Crown, made with full return flue or direct draft, and intended for using hard or soft coal as a fuel. The front and sides have ample mica illumination, and nickel plays a prominent part in the external decoration. A varied assortment of heaters of cheaper construction are illustrated, including air tights, sheet iron surface burners, globe and cannon stoves. In the way of oak heaters, the catalogue presents an interesting assortment, including a number of new patterns for this season, the line this year being larger in variety and styles than heretofore.

The Crown Oak is an attractive heater of its class, while the Prize Oak is another entirely new pattern, having an artistic cast iron front. The Royal is referred to as an original oak construction, with concealed fire pot and other features likely to commend it to the trade. In the line of furnaces, of which several are shown in the catalogue, special attention is directed by the manufacturers to the Crown warm air heater of the low down type, which renders it especially adapted for use in low cellars. It is made in several sizes, and in the catalogue the internal construction is indicated by means of engravings, which show the heater with the casing removed. An interesting feature of the closing pages is a chapter on "How to Best Determine Sizes of Warm Air Supply Pipes Used in Connection with a Ventilating Apparatus." Tables of capacities of pipes and registers are also given, together with some suggestions to be observed when installing the Crown warm air furnace.

The F. & W. Co. Hot Air Furnace No. 722.

We present herewith a broken view of a member of the No. 700 series of hot air furnaces being introduced to the trade by the Fuller & Warren Company of Troy, N. Y. A special feature in connection with the construction of this series of furnaces is that the radiator is of cast iron, made in one piece, thus preventing any possibility of leakage of gas, while insuring great durability. The construction of the radiator is such that by the insertion or removal of a "flue plate" it can be adapted to the use of hard or soft coal. The feed section or dome is of one heavy piece of cast iron sufficiently large to allow the gases to burn freely. It is joined to the radiator and fire pot by deep cup joints packed with kaolin, thus making gas tight connections. The fire pot is heavy and made in one or two parts, as desired. The walls are nearly perpendicular, which, it is claimed, not only increases the draft but allows a larger grate surface, thus permitting an additional body of live coals. This construction also tends to prevent an accumulation of ashes on the fire pot sides, thus insuring clean walls, while facilitating combustion of the fuel resting against the edges of the pot and materially increasing radiation at the point where the maximum heat is generated.



The F. & W. Company Hot Air Furnace No. 722.

The grate employed is of the triangular four-piece variety, the bars being operated in pairs by a shank that extends outside of the furnace. Any of the bars can be removed and replaced without disturbing other portions of the grate. The ash pit is unusually large, and will hold a great quantity of ashes, thereby lessening the possibility of burning out the grate in case of inattention.

This same style of furnace can also be supplied by the company provided with steel horseshoe radiator. In this case the steel walls are deeply imbedded in the cup joint of the top and bottom plates. The joints are filled with asbestos cement backing, thus insuring perfectly gas tight connections. A pamphlet which the company have issued and copies of which can be had by the trade on application illustrates and describes at length the heaters to which reference is here made.

Schill Steel Ranges and Cooks.

We have received from the Schill Brothers Company, Crestline, Ohio, advance sheets of their catalogue showing new steel ranges and cooks for 1902. The sheets are oblong in shape, are bound together at the top by means of silken cord and are inclosed in red paper covers, the front of which carries an embossed design in black and old gold. The text reads the narrow way of the sheets, so that in turning the pages it is done from the bottom instead of the side, as is the usual method. The Schill steel range is intended for using hard coal, soft coal, coke and wood, and is offered in several sizes. Its constructive features include spring balance door, pouch feed for coal, cast reservoir casing, the front of which is covered with sheet steel, while the bottom of the reservoir casing has a drip cup to take up and absorb all drippings from the reservoir and prevent them from running into the body of the range. The bottom of the smoke flue is cast iron. All sizes and styles can be furnished with swing feed door, if desired. The ranges are so constructed that a hot water circulating boiler can be attached if necessary.

The Schill steel cook is of neat exterior, has square ventilated oven, balance oven door which drops down, thus forming a convenient shelf; extra large ash pan, large hearth plate supported by brackets, screw draft in ash door and drop draft door in front, which can be opened to light the fire; duplex grate, interchangeable cover plates and other features likely to interest the trade. In the reservoir style provision is made to take up and absorb the drippings, as mentioned in connection with the steel range.

The Schill B and C ranges for 1902, to which attention is also invited, are made in 8 and 9 inch covers, four and six holes in the top surface, 20 and 22 inch ovens and in all styles and sizes. Reference is made to the Schill oak stove for wood and coal, which is made in four sizes. It is also made with hot blast.

The Standard Oven Thermometer.

The Helios-Upton Company, Peabody, Mass., who are the first to bring out an oven thermometer, have met with such success in the introduction of this useful and convenient device that they have sold 150,000 of them. Their thermometer can be adjusted to any oven and has no complicated parts. They have sold so many of them and to such a large number of the leading stove manufacturers that they confidently claim to have the best oven thermometer now in the market. It is sold in quantities as low if not lower than any other thermometer. An immense number have been sold for this year's business. The manner in which they handle the trade is to take a stove manufacturer's order for his season's supply and ship him a certain number each month.

Among those attending the recent convention of the Southern Hardware Jobbers' Association at Atlantic City, N. J., were Frank Ouerbacker of the O. K. Stove Company, Louisville, Ky.; John E. Gaitley and S. H. Jacobs of the Troy Nickel Works, Albany, N. Y.; E. R. Johnson of the Comstock-Castle Stove Company, Quincy, Ill., and L. D. Vogel of the Charter Oak Stove & Range Company, St. Louis, Mo.

ODD PLATES.

The Syracuse Stove Works, Syracuse, N. Y., have issued a price-list in the shape of a 16-page pamphlet, illustrating and describing the Welcome Furnace, which is fitted with the Kernan patented shell bar rotating and revolving grate. Other constructive features include heavy sectional corrugated fire pot; horizontal and vertically corrugated feed section; all cast or steel plate radiator with full revertible flue; improved boxed front; large dust flue and damper, and steel casing rings for double casings. A number of interesting data are presented within the pages of the price-list, special attention being given to dimensions and heating capacities of the various sizes manufactured.

The Steiger & Kerr Stove & Foundry Company, San Francisco, Cal., have just awarded the contract for a foundry building, a machine shop, a carpenter's shop and a warehouse to be erected at the corner of Folsom and Eighteenth streets.

A little pamphlet, issued by the Rochester Radiator Company, Rochester, N. Y., tells all about the Rochester Radiator, which they are offering in several styles and sizes. Particular emphasis is laid upon the economy of this device and the merits which are claimed for it. Accompanying the pamphlet are leaflets giving some of the many testimonial letters which the company have received regarding the Radiator in question.

At a recent meeting of the directors of the Duffy-Trowbridge Stove Mfg. Company of Hannibal, Mo., officers for the ensuing year were elected as follows: President, James Duffy; vice-president, C. H. Trowbridge, and secretary and treasurer, W. F. Chamberlain.

The Odin Gas Range is the subject of a neat little pamphlet of a size convenient to carry in the pocket, which is being sent out by the Odin Stove Mfg. Company, Erie, Pa. The constructive features to be found in the Range are set forth at considerable length and illustrations are given showing the general appearance of the Range with oven and also with broiler and oven. A sectional view gives an idea of the appearance of the Range when dismantled. Attention is called to the Tri-Odin Sectional Burners, intended for using natural gas, and in connection with which prices are to be found.

H. P. Gingrich, the Illinois representative of the American Stove Company, Ringen Stove Company division, has been absent since May on an extended trip abroad, devoting much of his time to travel in Germany. It is expected that he will return in July, and will then be pleased to visit his many friends in the interests of the Quick Meal line.

The Cleveland Steel Range Company, Cleveland, Ohio, utilize a neat four-page folder for the purpose of calling the attention of the trade to their Gem Ideal Gas Range, which is made with double oven and water heater. The body is of cold rolled steel, the linings of asbestos, the ovens are ventilated and the burners are of the direct flame type. All grates are flush, and for burning natural gas the Range is furnished with closed top. The exterior is neat and attractive, nickel being judiciously employed. The catalogue which the company have issued gives full particulars regarding the merits of their leading lines.

C. Emrich of 371 South High street, Columbus, Ohio, is sending out a 20-page pamphlet as a supplement to his general catalogue No. 8. It illustrates a number of patterns of Cooks and Ranges which have been added to the maker's already extensive line. The Ranges are offered under the names Crown Florence for coal or wood and the Noble Florence for wood only. They have four boiler holes in the top surface, nested griddle cover, oval fire box, large square ovens, direct flues and other features calculated to command the attention of the trade. The goods are made in several styles and sizes, and are of attractive exterior. The new Cooks include the Crown and Earl Florence for coal or wood and the Noble Florence for wood only. The features embodied are of the modern type, and the makers feel confident the goods will prove very popular with the trade.

Work has been begun on the new plant of the Quaker Mfg. Company, Chicago Heights, Ill., formerly known as the Wireton Heating Company of Blue Island. The company are manufacturers of Hot Air Furnaces and Combination Hot Air and Hot Water Heaters. The plant will comprise an engine and boiler house, pattern shop, together with a foundry, 70 x 150 feet, one-story high; erecting shop and shipping building, 50 x 200 feet, two stories high, and a warehouse, 50 x 150 feet, one-story high.

E. H. Stockstrom, sales manager of the American Stove Company, St. Louis, is absent on an extended pleasure trip abroad, and from last reports he is enjoying the attractions of travel in Germany.

The Hopson-Haftenkamp Company, Grand Rapids, Mich., have issued a catalogue and price-list of 120 pages covering their large line of Airtight Stoves and Furnaces, Tinners, and Roofers' Supplies.

The latest edition of *The Stove Repairer*, issued by H. E. Hessler Company of Syracuse, N. Y., contains a vast amount of matter likely to prove of interest to the Stove dealer who also carries in stock more or less of a line of Hardware and Tin Shop Supplies. In the introductory pages the point is made that *The Stove Repairer* has many advantages over other salesmen in that "it travels cheaper, has no hotel bills, no incidental expenses, asks no large salary, and as a consequence is able to quote better prices on first-class goods than any competitive salesman." The main lines represented by the publication are Stove Repairs, Furnace Repairs, Water Fronts, Fire Clays, Asbestos Cements, Putties and a general line of Tin Shop Supplies in combination with a large line of Hardware and House Furnishing Goods.

Rohrbacher & Allen, 166 South Howard street. Akron, Ohio, are now making the Jahant Hot Blast Furnace with air box and elbows of cast iron instead of galvanized iron as heretofore. These changes the manufacturers state are meeting with great success. An interesting pamphlet which the makers have issued illustrates and describes the Jahant Furnace at considerable length, and gives in connection therewith a long list of testimonials from some of those who have practically demonstrated the merits of the heater.

The Danville Stove & Mfg. Company, Danville, Pa., are just putting on the market an all cast Gas Range in three sizes—16, 18 and 20 inches. It is designed principally for use in the natural gas territory of Pennsylvania. The company have remodeled their cheap Heater, the Ideal Beaver, bringing it out in a new dress, with a more modern and artistic appearance than formerly. They are also making radical changes in their Beaver Oak, placing all five sizes on a handsome base. They are now making double as well as single Heaters.

Death of Edward N. Currier.

On Thursday, June 19, Edward N. Currier was run down by an electric car in Cleveland, Ohio. He died on the following day, and was buried from his home, 145 Sibley street, the funeral being largely attended by his Masonic brethren and the Elks, with a special committee from the Furnace Dealers' Association. Mr. Currier was the founder of the City Stove Repair Company, 104 Prospect street, Cleveland, and was held in high esteem by his business associates and friends. The business will be continued by his wife under the management of Frank W. Satchell, who has been the assistant manager for the past 15 years. The funeral services were conducted by Dean Williams of Trinity Cathedral, and the Cathedral Quartette rendered appropriate musical selections. The pallbearers were from the Masonic lodge to which he belonged, and the interment was made at Lake View Cemetery.

The Cincinnati fall festival, "for the honor and glory of Cincinnati," will be held September 15-27. The gathering will be conducted under the auspices of the Fall Association of Cincinnati.

Cords Bros. are successors to Edward F. Cords in the retail Hardware, Stove and Sporting Goods business in Elkader, Iowa.

ARKANSAS RETAIL HARDWARE DEALERS' ASSOCIATION.

The third annual meeting of the Arkansas Retail Hardware Dealers' Association was held in Little Rock on June 18 and 19, with 46 members present. The meeting was called to order by President John M. Pittman on Wednesday morning and the delegates were welcomed by Mayor Duley of Little Rock in an eloquent address. Vice-President Maxey responded to the address of welcome.

The president appointed the following committees:

Auditing: J. F. Maxey, R. P. Graham, K. G. McRea.
Resolutions: H. H. Morgan, R. F. Roys, E. E. Mitchell.
Question Box: W. M. Harrell, Hamp Williams, Frank Gregg.

The annual address was delivered by President Pittman, who expressed the desire that more of the retail hardwaremen of the State should join the association, in order that it might be enabled to accomplish more substantial results. He recommended the election of a salaried secretary, who would be able to give enough time to the association, and that the secretary issue an annual manual and papers, with such other information as would help to build up the retail hardware trade of the State. He also recommended that the date of the annual meeting be changed from the third Wednesday in June to the second Wednesday in May.

Secretary-Treasurer John A. Plummer of Marianna submitted his report, showing a membership of 52 and a cash balance of $60.50. J. B. Gregg of Little Rock read an interesting paper entitled "What Effect Will a Combine of Large Hardware Companies Have on the Retailers?" The convention then adjourned until Thursday morning.

The session on Thursday morning was initiated by Hamp Williams, who read a paper on "The Most Important Things in Conducting a Hardware Business." A discussion of the subject of "Freights and Railroad Commissions" followed. W. M. Graham of Clarendon read an interesting paper on "Fakes and Fakirs; or, Leg Pullers," in which he referred to this as one of the greatest evils of business. The paper was followed by a lively discussion of the subject.

The Question Box then being opened, discussion was held on the subjects "How Goods Should be Marked" and "Is This a Good Time to Buy Wire Nails?"

At the Thursday afternoon session the Nominating Committee made the following report, which was adopted and the parties named duly elected:

President, Jno. M. Pittman, Prescott.
First Vice-President, J. F. Maxey, Ozark.
Second Vice-President, T. B. Stewart, Newport.
Secretary and Treasurer, C. E. Taylor, Little Rock.

President Pittman appointed the following committees:

Executive Committee: E. E. Mitchell, Morrilton; W. M. Graham, Clarendon; Hamp Williams, Hot Springs; J. H. Bolcourt, Little Rock; R. F. Roys, Russellville.
Membership Committee: D. E. Watson, Hamburg; C. T. Rosenthal, Batesville; W. A. Jackson, Dardanelle; K. G. McRea, Hope; D. H. Miller, Van Buren.
Grievance Committee: J. A. Plummer, Marianna; W. M. Harrell, Conway; W. M. Graham, Clarendon.
Committee on Fraternal Relations: L. P. Rudolph, Arkadelphia; J. B. Avera; F. L. Curfman, De Queen.
Transportation Committee: Frank Stearns, Hot Springs; J. H. Bolcourt, Little Rock; Frank Gregg, Little Rock.
Programme Committee: E. E. Mitchell, Morrilton; W. L. Babcock, Hot Springs; R. P. Graham, Fordyce.

Mr. Pittman, the president, was presented with a pair of gold glasses by the association, and Mr. Plummer, the secretary and treasurer, with a gold headed cane. The meeting then adjourned *sine die*.

On Wednesday evening the local members of the association, assisted by the jobbers, entertained the visiting delegates in a charming and delightful manner through the medium of a moonlight excursion on the Arkansas. A 25-mile sail was had and the occasion was most heartily enjoyed by a party numbering about 200.

George H. Cole and Lester F. Cole have just formed a partnership under the name of George H. Cole & Son, for the purpose of conducting a retail Stove store at 229 River street, Troy, N. Y. The business was previously conducted by George H. Cole.

The Annual Meeting of the Vulcan Club.

The third annual meeting of the Vulcan Club (Cleveland Furnace Dealers' Association) of Cleveland, Ohio, was held on the evening of June 19. The treasurer's report showed a considerable gain in financial strength during the third fiscal year of the organization, the club now having a comfortable surplus, approaching four figures, in hand. The retiring president, George W. Bennett, delivered his annual address, and the secretary's report, reviewing the work of the past year, showed that the club had good cause to congratulate itself upon the result of its activities.

The election of officers to serve during the ensuing fiscal year resulted as follows:

President, C. R. Holmes of the Holmes Furnace & Stove Company.

Vice-President, M. C. Bosworth of the Burrows-Bosworth Hardware Company.

Treasurer, W. H. Dettlebach of the Dettlebach Plumbing & Heating Company.

Secretary, E. F. Bohm.

Sergeant-at-Arms, W. C. Oates of Bogue & Oates.

Directors: C. R. Holmes, M. C. Bosworth, E. F. Bohm, W. H. Dettlebach, W. G. Smith and G. G. Brown.

Messrs. Dettlebach and Bohm were chosen to serve as treasurer and secretary, respectively, for the fourth time.

Lalance & Grosjean Mfg. Company.

Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, have thoroughly renovated their offices and sample rooms at this address. New ornamental metal ceilings and wainscoting have been put in throughout and tinted, together with hard wood floors, entirely new furniture, such as desks, chairs, &c., and a number of other such conveniences. On the wall in the main office are two large framed pictures, one of which represents the great plant at Woodhaven, L. I., where is manufactured nickel-steel ware and the various other classes of goods such as japanned and tin ware, galvanized goods and numerous special articles for the trade which are made to order. The other picture represents their large rolling mills at Harrisburg, Pa., where is manufactured from the billet different kinds of sheet iron and tin plate used at Woodhaven. In marked contrast with these two immense plants as they exist to-day is a small colored print of the Woodhaven shops representing them as they appeared in 1863, at that time called the "spoon factory."

On the top of the main building at Woodhaven they have recently installed an electrical sign 340 feet long, with letters 8 feet high, showing the words Nickel-Steel Ware, which is probably the largest sign of the character in existence.

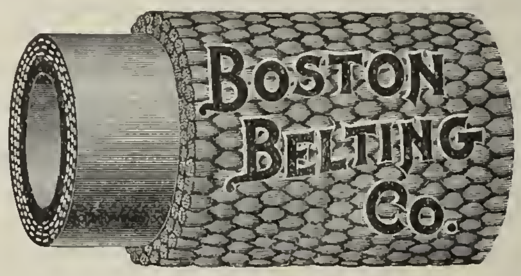
In the New York office they have a souvenir of the Spanish War in the form of an ordinary nickel-steel agate ware cup, which was one of a large number presented to Troop C, New York Volunteer Cavalry, who in May, 1898, were entertained by A. J. Cordier, the vice-president of the company, at Woodhaven Junction, while *en route* from Camp Black to Camp Alger, and afterward Porto Rico. Each member of the troop, after being entertained at Mr. Grosjean's mansion nearby, was presented with one of these cups, this particular one having been returned with the evidence of service on it by Charles Curie, Jr., of the law firm of Curie, Smith & Maxwell of this city, who was a member of the troop.

The Y-R Fly Killers.

The Wire Goods Company, Worcester, Mass., are putting on the market the Y-R fly killers, which are made in two styles, with twisted wire handle and black enameled wooden handle. There is a kink in the outside wires, and the binding cord across the face of the brush is tied into the kink and thus kept securely in place. It is explained that the brush wires are fastened to the handle by an improved method, the handle and brush being joined so as to be practically one piece. The killers are packed ready for delivery to the customer, each killer being wrapped and protected by a paper cover, thus making a saving to the merchant, besides keeping the killer in good condition for sale. Among the points of excellence mentioned by the manufacturers are the following: That the handle will not break where the brush is joined, that the handle and brush will not come apart and that the brush will keep in shape.

The Universal Cotton Jacket.

The Boston Belting Company, Boston, Mass., are now prepared to weave over various kinds of rubber hose the cotton jacket shown herewith. This is a heavy, seamless fabric, to increase the strength of hose and to add to its capacity for withstanding the wear and tear of being dragged about where the wear is hard, as when used by contractors and in mines. The jacket is painted to render it waterproof. The manufacturers state that it never kinks, does not get bent or out of shape and that it does not unwind should a single strand be cut. The jacket is applied to air, gas, water, steam, air and steam drill hose.



The Universal Cotton Jacket.

Stove and Hardware Dealers.

Peters & Hardin, dealers in Hardware, Stoves and Sporting Goods, Gretna, Neb., have disposed of their business to Sanborn Bros.

The New Jersey Aluminum Company, Newark, N. J., issues catalogues of novelties for advertising and souvenir purposes. They are accompanied by a price-list.

G. B. Cadwell & Son have purchased the Hardware, Stove and Tinware business of Van McCurdy, at Atlantic, Iowa.

M. L. Brady has removed his Hardware, Stove and Harness stock from Sulphur Springs, Ark., to Lenapah, Ind. Ter.

Plummer & Wheeler, Hardware dealers, Petersburg, Va., have been succeeded by the John F. Plummer Company, who will continue the wholesale and retail business in Hardware, Stoves, Agricultural Implements, Sporting Goods, Wooden Ware, Carriage Material, &c.

Keneipp & Grimwood, in the Hardware, Stove, Harness and Lumber business, Owensville, Ind., have been succeeded by Grimwood & Co.

W. J. Bush has disposed of his interest in the Hardware, Stove, Roofing and Plumbing business of Bush & Martin, at New Bethlehem, Pa., to Chas. H. Heath, formerly of Oak Ridge. The new firm style will be Heath & Martin.

New York Hardware Company, Chandler, O. T., have been incorporated with a capital of $10,000. Their line comprises Shelf and Heavy Hardware, Stoves and Tinware, Sporting Goods, Plumbing Goods, &c.

George E. Gomley has succeeded Geo. E. Fairbanks & Co. in the Hardware, Stove, Agricultural Implement, Sporting Goods and Heating and Plumbing business, at Abington, Mass.

The Schunk-Marquardt Company, Toledo, Ohio, wholesale and retail Shelf Hardware, Stoves, Tinware, Sporting Goods, Paints, Oils, &c., have been incorporated with a capital stock of $100,000.

The capital stock of the Simmons Hardware Company, Beaumont, Texas, wholesalers and retailers of Hardware, Stoves, Tinware, &c., has been increased from $10,000 to $20,000.

THE OFFICERS OF THE NATIONAL ASSOCIATION OF MASTER PLUMBERS.

Especial interest will be taken in the portraits of President E. D. Hornbrook and Vice-President Charles Polacheck of the National Association of Master Plumbers, which we take pleasure in presenting herewith, from the fact that for the second time only in the history of this important trade association it has re-elected its officers.

President E. D. Hornbrook, who is at the head of a successful plumbing and heating business in Kansas City, Mo., attracted the attention of his fellow members in the National Association through the clearness and force of his arguments on all occasions before the association when he sat in its conventions as a delegate. When Mr. Tierney was elected president Mr. Hornbrook was chosen vice-president of the association. During Mr. Tierney's illness he found it necessary to perform many of the offices of the president, and he was thoroughly acquainted with all the trade agreements that had existed for a number of years back, when, at the close of President Tierney's administration, the association elected Mr. Hornbrook to succeed him in the presidential office.

His administration has been a strong one and he has accomplished much for the trade through the force of his personality and the influence which he wields. During President Hornbrook's administration the Cleveland Resolutions, which have secured the practically unanimous support of the plumbing trade, were substituted for the New York Conference Resolutions. Mr. Hornbrook was very reluctant to again take up the burdens of the president's office, and it was only after it was made clear to him that it was the unanimous feeling of the delegates that he was best calculated to secure the observance of these resolutions, that he allowed his name to again be presented to the convention. He was unanimously elected.

Vice-President Charles Polacheck has also been a man of strong influence in the councils of the National Association of Master Plumbers, which has seen fit to confer upon him for the second time the second highest honor in the gift of the association. Mr. Polacheck is at the head of a successful plumbing business and is also interested in the manufacture of gas fixtures in Milwaukee, Wis. He has represented his State as delegate in the national convention for a number of years and has also served as a member of the Wisconsin State Legislature, so that he brings to the National Association a wide experience and a ripe judgment. It was he who proposed the name of Mr. Hornbrook for re-election, expressing the belief that Mr. Hornbrook's influence and personality were at this time essential to the association and saying that to act as his assistant was a sufficient honor. Mr. Polacheck is second only to Mr. Hornbrook in the esteem of the members of the National Association of Master Plumbers, and is held to be almost equal to him in the influence which he can bring to bear upon all questions of importance.

President E. D. Hornbrook.

Vice-President Charles Polacheck.

THE OFFICERS OF THE NATIONAL ASSOCIATION OF MASTER PLUMBERS.

* * *

The Chicago House Wrecking Company, the company that are tearing down the buildings of the Pan-American Exposition, state that within 60 days the Exposition will live only in memory; that by that time all the buildings will have been obliterated. So far the Government, the Agricultural, the Manufactures and the Horticultural buildings are practically demolished, and men are working on the Machinery Building and the Electric Tower. The Goddess of Light is to come down from the tower within a week, as the purchasers are anxious to get her to grace a popcorn stand in Cleveland, Ohio.

The United States Government authorities will, it is announced, shortly invite tenders for the construction of sewers and water works for the city of Manila, Philippine Islands. The estimated cost of the undertaking will be about $4,000,000.

The Census Bureau have issued a report on the manufacture of needles and pins in the United States, which shows a capital of $3,235,158 invested in the manufacture of these articles by 43 separate establishments. The annual value of the product of needles and pins is placed at $2.738.439.

The Tin Plate Industry.

Census Report for the Year 1900.

The Census Bureau has completed an elaborate report upon the manufacture of tin and terne plates in the United States in the census year 1900, prepared by William G. Gray of Philadelphia, expert special agent for iron and steel. The returns show a capital of $6,790,047 invested in the tin and terne dipping industry by the 57 active establishments reported for the United States, but this sum represents only the value of land, buildings, machinery, tools and implements and the live capital utilized, and does not include the capital stock of any of the manufacturing corporations engaged in this industry. A majority of the establishments which manufactured tin or terne plates, or both, during the census year, also operated rolling mills, these mills being equipped for the production of the black plates which were coated with tin or with tin and lead in the tin dipping departments. At some plants, however, tinning pots had not been installed, and black plates or sheets were chiefly produced. Practically all the black plates made by establishments of the latter character were consumed by the tin dipping or stamping works of the country. There were 44 establishments engaged in the production of black plates during 1900, employing a capital of $20,698,255. Combining the two branches of the industry the total capital employed was $27,488,302; the total wages, $10,288,061; the cost of materials, $45,004,716, and the value of products, $61,912,619.

While it might appear that because 57 establishments were reported in the tin and terne dipping industry and 44 in the manufacture of black plate, there were, therefore, 101 establishments in the combined industries, this was not the case, since establishments which performed both operations—namely, the manufacture of black plates and the dipping of these plates—would thus be counted twice. As a matter of fact, there were 35 active dipping establishments which were equipped also for the manufacture of black plates, and in addition there were 22 active plants equipped for tin and terne dipping only, and nine plants equipped for the manufacture of black plates only, or a total of 66 active plants. The items given as the cost of materials in the combined industry include a duplication of $20,590,566, being the value of black plates reported by that branch of the industry and used as material in the tin and terne dipping mills. Similarly, in order to obtain a true total value of products it is necessary to deduct from the total value of products shown for the combined industries the value of the black plates produced by the black plate establishments and used as material in the tin and terne dipping establishments. In this manner it is found that the total value of the products of the combined industries was approximately $41,322,053. In this total, however, there are included products other than black plates or tin and terne plates, valued at $9,660,669.

In these calculations it is assumed that the domestic black plates consumed by the tin and terne plate plants were all produced during the census year. Of course this is not the fact, as a considerable part of the black plates consumed by tin and terne plate plants in the early part of the census year was drawn from stock made in the previous year, while a large part of the black plates produced by domestic mills toward the close of the census year was still in stock, not having been forwarded to the tin and terne plate plants. The figures for cost of materials and value of products for the combined industries are not, therefore, altogether exact. They are, however, approximately correct and give a fair idea of the importance of the combined industries during the census year.

Tin and Terne Plates.

The materials employed in the tin and terne dipping industry during 1900 were as follows: Domestic black plates, 825,566,992 pounds, valued at $20,590,566; foreign black plates, 2,358,607 pounds, valued at $78,288; pig tin, 20,282,778 pounds, valued at $4,528,173; pig lead, 6,871,480 pounds, valued at $398,617; palm oil, 5,511,645 pounds, valued at $282,227; sulphuric acid, tinning flux, bran and pink meal, $187,318; boxes and nails, $303,316; all other materials, $269,351; total, $26,728,150. From these figures it appears that aside from black plates, which amount to 77.3 per cent. of the total cost of the materials used, pig tin and pig lead were the most important items. It is also seen that the use of foreign black plates, which was confined to the States of Pennsylvania and Virginia, was very small compared with the use of domestic black plates and sheets. Bituminous coal and slack and natural gas were the most important fuels used in the order named. Nineteen establishments employed natural gas for fuel in whole or in part. The total output for the census year was returned at 707,718,239 pounds of tin plates, valued at $25,553,021, and 141,285,783 pounds of terne plates, valued at $5,731,124. The total production of the industry was increased by small quantities of other articles valued at $607,866.

A number of the dipping plants run on single turn only, each turn being, on an average, ten hours. At other plants, however, especially those which produce their own black plates, double and triple turn is the practice, two and three sets of skilled workmen being employed. Based upon double turn the capacity of the completed works for tin plates alone, including the two idle plants, was 4,037,076 pounds daily, or allowing 300 working days for each year, 1,211,122,800 pounds annually, and for terne plates, 1,482,726 pounds daily, or 444,817,800 pounds annually. The total yearly capacity for the two products on double turn is thus found to be 1,655,940,600 pounds. These capacities are, of course, largely theoretical, as it would be almost a physical impossibility to operate all the tinning sets in the country at the same time and on double turn.

In summarizing the statistics of the industry by States it appears that the bureau has followed the rule that in cases where less than three plants were located within a State, or where all the plants in the State were operated by an individual company, the statistics should be included with those for another State. There were 25 establishments in Pennsylvania engaged in the tin and terne dipping industry, with an aggregate capital of $3,042,029. The average number of wage earners employed was 1578. The products included 256,879,332 pounds of tin plates, 77,129,648 pounds of terne plates and 200,473 pounds of other sheet iron or sheet steel, tinned or terne plated. Pennsylvania apparently enjoys the distinction of being the only State from which tin and terne plates were exported by the manufacturers during the census year. The quantity reported was 17,939 pounds, valued at $897.

Since the establishments in operation in Indiana were all under the management of a single company, the statistics of capital invested, the cost of materials used and the value of products have been included with similar data for the State of Illinois. All the five Indiana establishments produced both tin and terne plates. In reaching a total for the establishments in the State, each of the five plants operated by the single company above referred to has been counted as one establishment. The average number of wage earners employed during the year was 572. Indiana was the only State which used natural gas exclusively for fuel in the manufacture of tin and terne plates during the census year, not one of the five establishments reporting the consumption of a single ton of coal. During the census year there were three establishments in Illinois engaged in the tin dipping industry. Terne plates were not made. The average number of wage earners employed during the year was 166. The capital invested in the eight tin and terne plate plants in Indiana and Illinois was $1,117,184. The products included 231,992,162 pounds of tin and terne plates and 800,000 pounds of other sheet iron or sheet steel, tinned or terne plated.

There were 12 completed tin and terne dipping establishments in Ohio at the close of the census year, with a total capital of $1,203,265. The average number of wage earners employed during the year was 697. The products included 132,163,383 pounds of tin plates and 30,146,921 pounds of terne plates.

As Maryland and West Virginia had each only two tin and terne dipping establishments in operation during the census year, it is necessary to combine the data for the two States to avoid disclosing the operations of individual establishments. The four establishments located in these two States reported a total capital of $586,182. The average number of wage earners employed was 274. The product was 67,721,725 pounds of tin and terne plates. The establishments in Maryland made tin plates only.

During the census year there were four tin and terne dipping establishments in operation in the State of New York, with an aggregate capital of $245,579. The average number of wage earners employed during the year was 55. The products included 5,591,050 pounds of tin plates and 3,900,000 pounds of terne plates.

In each of the States of Virginia, Kentucky, Michigan and Missouri only one tin or terne plate plant was in operation during the census year. The total capital reported was $1,050,067. The average number of wage earners employed during the year was 329. The products included 43,479,801 pounds of tin and terne plates—mostly in tin plates. The Michigan establishment consumed their entire product in their own works in the manufacture of various specialties. Virginia and Kentucky made terne plates only and Michigan and Missouri made tin plates only.

Black Plates.

The materials consumed in the black plate industry were valued at $18,276,566 and included iron ore, 1035 tons; pig iron, spiegeleisen and ferromanganese, 16,514 tons; scrap iron, 34,422 tons; iron or steel ingots, blooms. billets, tin plate bars, &c., 648,807 tons; fuel, $869,070; all other materials, $2,643,358.

More than nine-tenths of the black plates manufactured were made from Bessemer steel and less than one-tenth from open hearth steel. The average value of all kinds of black plates for tinning was $53.21 per ton. Changing gross tons to pounds, it appears that the total production of Bessemer and open hearth steel black plates in 1900 was 882,591,360 pounds, of which 795,372,480 pounds were Bessemer steel and 87,218,880 pounds were open hearth steel. These figures do not include the 79,096 tons of plates and sheets other than black produced by black plate mills during the census year.

Pennsylvania ranked first in the production of Bessemer steel black plates during the census year, producing almost one-half of the total quantity. Indiana was second, Ohio third and West Virginia fourth. These four States made over 96 per cent. of the total production of Bessemer steel black plates. Pennsylvania, Ohio and West Virginia also produced almost all of the 79,096 tons of other plates and sheets reported above, Ohio ranking first, Pennsylvania second and West Virginia third. In the production of open hearth steel black plates Missouri ranked first, Pennsylvania second, Illinois third and Ohio fourth. These four States produced over 96 per cent. of the total production of open hearth plates.

The returns show that there were 355 completed and building hot black plate mills located in the 44 active and three building establishments. Of these mills 332 were completed and 23 were building. The total annual capacity of all the hot mills, both completed and building, was 692,725 gross tons of finished black plates. The completed mills had a capacity of 641,450 tons and the building mills a capacity of 51,275 tons. The number of cold mills was 308, of which 294 were completed and 14 were building. The hot and cold mills in course of construction were located in Pennsylvania, Ohio and Michigan.

In point of equipment and capacity Pennsylvania was first with 170 hot mills (160 completed and ten building) and 162 cold mills (157 completed and five building). The hot mills had an annual capacity of 340,575 gross tons of finished black plates (completed mills, 314,325 tons, and building mills. 26.250 tons). Ohio was second with 68 hot mills (59 completed and nine building), having an annual capacity of 131,850 tons of black plates (completed mills, 114,525 tons. and building mills. 17.325 tons). and 63 cold mills (58 completed and five building). Indiana was third with 53 completed hot mills. having an annual capacity of 102.025 tons. and 38 cold mills. Illinois was fourth with 28 completed hot mills, with an annual capacity of 50,700 tons of black plates, and 12 cold mills. None of the other States named in the table had more than 14 hot mills or an annual capacity exceeding 28,000 tons of finished black plate.—*The Iron Age.*

THE TIN PLATE WAGE SCALE.

A conference will be held in New York on Monday, June 30, between officials of the American Tin Plate Company and the Amalgamated Association, for the purpose of arranging the tin plate scale for the year commencing July 1, 1902. The American Tin Plate Company will be represented in the conference by Warner Leeds, third vice-president, and by the district managers, consisting of J. R. Philipps, William Banfield, Cecil A. Robinson and Berthold Goldsmith. The base of the scale has already been fixed, and remains at $4.20 a box, and for each 10 cents advance per box in the price of tin plate there shall be 2 per cent. advance in wages. No agreement has been reached on the foot notes, and these will be considered at the coming conference. In addition to the 23 foot notes now in the tin plate scale, seven new ones have been proposed by the Amalgamated Association, commencing with No. 24, as follows:

24. That the screw boys do not bundle any scrap ends, scrap to be bundled by the company.

25. That all tin mills be paid at least every two weeks.

26. That we ask for Cleveland scale and the conditions governing mills granted at the Cleveland conference.

27. That when in the judgment of the manager and Mill Committee the work is too heavy for the catcher the company to furnish helper.

28. That when dirty bars are supplied for tin mills the company shall furnish a man to sweep them and the crew shall not be held responsible for dirty iron. The crew shall be paid for production per mill for such iron put in by the company.

29. That no more level hand jobs be given in tin mills, and level hand men be singled out as soon as vacancy occurs.

30. That ten (10) per cent. extra shall be paid for 40 gauge when doubled three (3) times.

Sheet Metal Interior Decorations.

The Kinnear & Gager Company, Columbus, Ohio, have issued their Catalogue No. 15, covering their products in the line of stamped steel ceilings, side walls, wainscoting, &c. The publication is 9 x 12 inches in size, of 52 pages, bound in a sage green cover and contains a large number of half-tone illustrations of the company's goods, together with views of interiors in which their ceilings and side walls have been used. The designs are handsome and many of them extremely elaborate and artistic in character, particularly those intended for use in large halls, churches, stores and offices. In addition to the ceilings, side walls and wainscoting, illustrations are given of center pieces, rosettes, borders, friezes, panels, beam covers, coves and cornice molds. The cuts, in many cases, are further supplied with profiles, which give a good idea of the decorative capacity and depth of the stampings. Full directions are also provided for erecting the company's steel ceilings, the panels of which are equipped with the Kinnear patent interlocking slip joint. Suggestions are also offered in regard to the selection of designs especially suited for various kinds of interiors.

The last page of the catalogue is devoted to the Kinnear & Gager paneled steel fire doors and shutters. These are provided with the company's new malleable iron automatic hinge, which is attached to the face of the wall by expansion bolts. These doors and shutters are covered with galvanized steel, which fully protects the wooden interior. The space between the panels is filled with asbestos fibre. The company advise us that their plant is running full in all departments, and that they are experiencing a large and steady demand for their products. A supplement to this catalogue, showing 25 new designs, will be issued shortly.

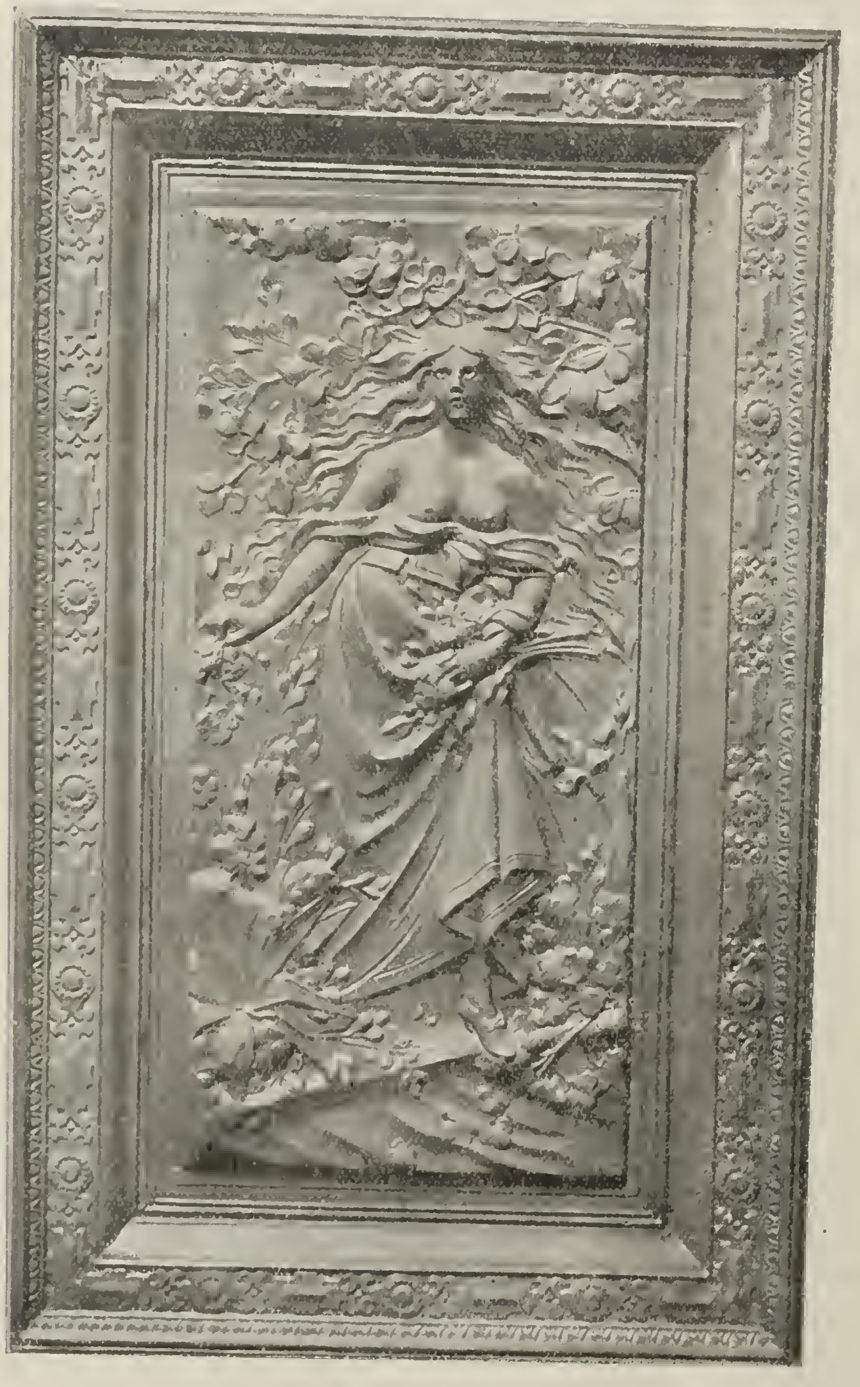
Death of T. New.

Tobias New, founder and head of the T. New Construction Company, manufacturers of roofing material at 537 West Fourteenth street, New York City, died on June 20, at his home, 50 Gates avenue, Brooklyn, after an illness of three weeks from a complication of diseases. Mr. New was of Dutch descent, and was born at Fulton, Schoharie County, N. Y. Early in life he engaged in the stove business at Bridgeport, Conn., and at Keene, N. H. In 1858 he removed to New York City, and became connected with Cyrus M. Warren in the roofing and paving business. Four years later he formed a partnership with H. G. Barnes under the firm name of Barnes & New. Mr. Barnes retired in 1869, and Mr. New continued the business until the time of his death, under the name of the T. New Construction Company. He was a member of the Lafayette Avenue Presbyterian Church of Brooklyn, of the Society of Mechanics and Tradesmen and of the American Institute. Mr. New leaves a widow and one son. The funeral services were held on Monday afternoon, and the interment was made in Greenwood Cemetery.

THE large Sheet mill plant of Zug & Co., Limited, Pittsburgh, Pa., has been working full time, with a large volume of orders. The plant will probably be shut down temporarily at the end of the month for stock taking and for the making of the necessary repairs.

Artistic Sheet Metal Stamped Work.

We have already made reference in these columns to the line of artistic sheet metal products manufactured by the New York Iron Roofing & Corrugating Company, Jersey City, N. J. Herewith we present two examples of the productions of the company in this line. In Fig. 1 is shown a handsome bas relief plate representing Ophelia, which is made in size 24 x 48 inches, without the decorative frame. These plates are made in zinc, copper or aluminum. Fig. 2 gives an example of one of the company's side wall plates in the Italian Renaissance style. These plates are 24 x 48 inches, and form a most attractive appearance when used for the walls of any building in connection with a ceiling of corresponding design.



Artistic Sheet Metal Stamped Work.—Fig. 1.—Panel of Ophelia.

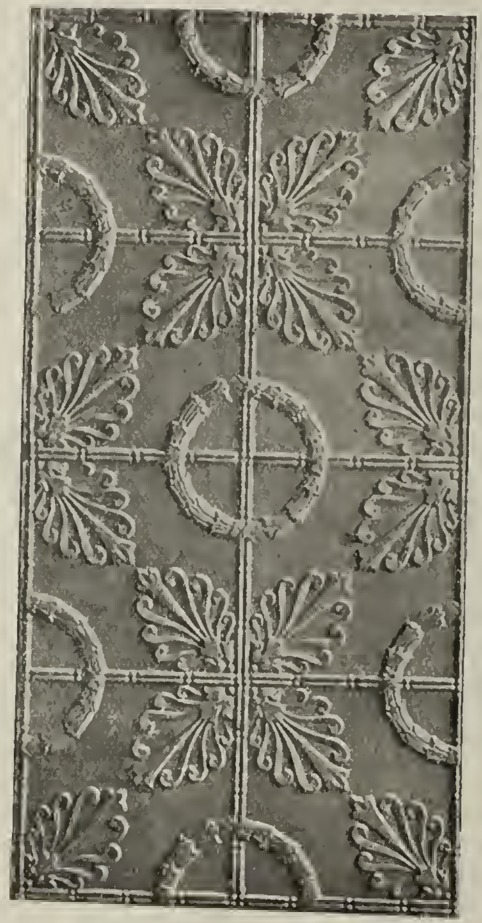


Fig. 2.—Italian Renaissance Side Wall Plate.

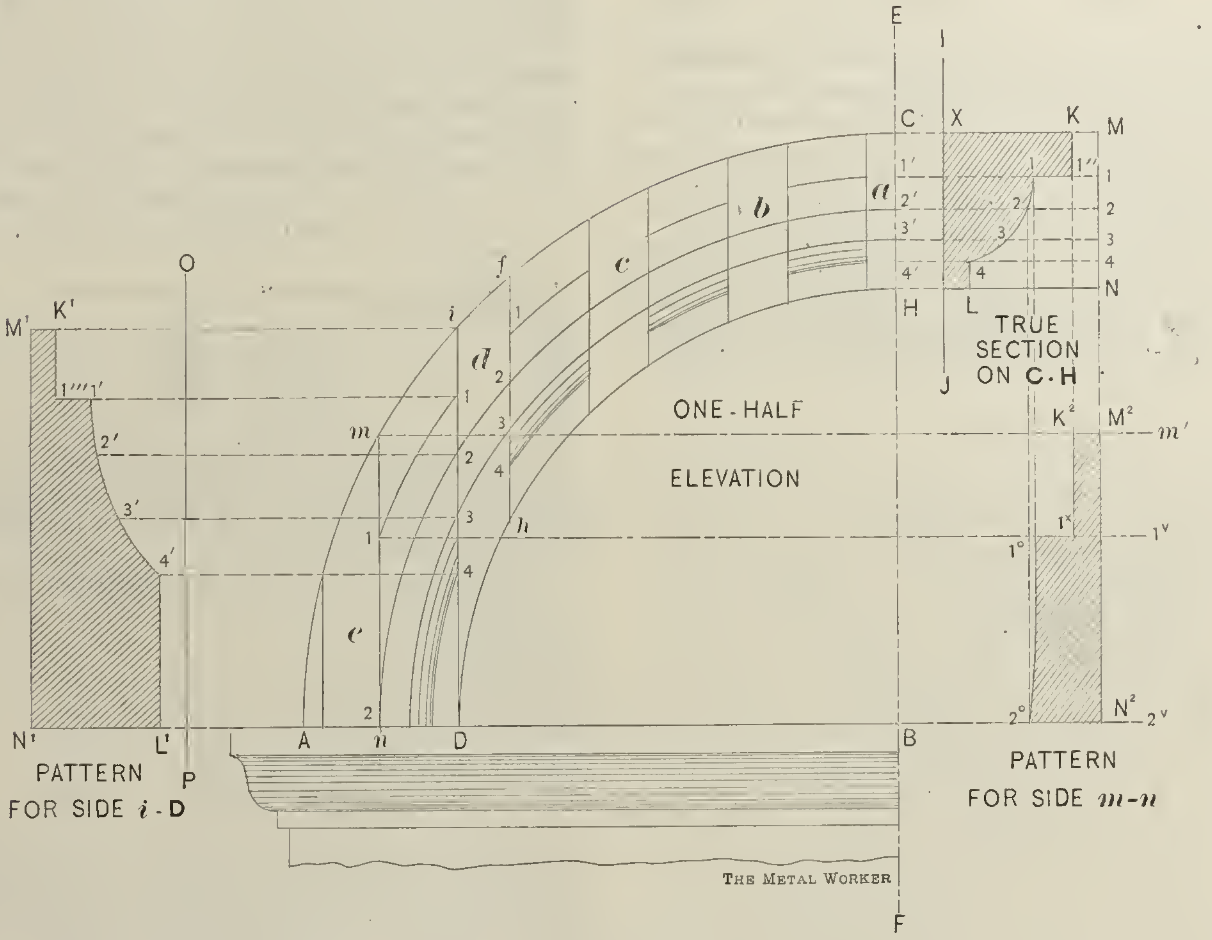
Tin House Workers' Wage Scale.

The tin house workers' wage scale for the year beginning July 16 next was arranged last week at a meeting in New York between the officials of the American Tin Plate Company and of the Tin Plate Workers' International Protective Association. The principal change in the scale was an advance of about 5 per cent. in the wages of workmen employed on the new Jenkins patent tinning machine, the use of which dispenses with the services of the riser. This machine has been successfully used in the American Tin Plate Company's plant at Elwood, Ind., and will probably be introduced in the other plants of the company, as they have purchased the patent rights. Some few minor changes were also made in the direction of equalizing the wage rates for the same class of work in all the mills. The officials of the Tin Plate Workers' Association are now engaged in conferences in regard to the scale with the various independent tin plate manufacturers.

PATTERNS FOR SQUARE DENTILS IN SEGMENTAL PEDIMENT.

PROBLEM: Where the sides of various square dentils intersect the molds of a segmental pediment on vertical planes, to find the patterns for the various dentil sides.

A correspondent desires to be informed through the columns of *The Metal Worker* how to obtain the patterns for the square dentil blocks fitting against the molds of a segmental pediment, as shown in the accompanying illustration, in which A B represents the horizontal molding on which the pediment is to rest. Through B, the center point, draw the line E F at right angles to A B. Then from B as center, using the desired radius, as B H, describe the arc H D. Now place the hight of the mold upon the center line E F, as shown from H to C, and using B as center and B C as radius describe the outer arc C A. Now parallel to E F draw the line I J, upon which, in its relative position to the points C and H on the line E F, draw the true section of the mold on C H, as shown by X K L. Then draw the side of the dentil M N L, which will represent a true section of the dentil also on the line C H. Now space and draw the dentils in their proper positions in the elevation, as shown by *a*, *b*, *c*, *d* and *e*.



Patterns for Square Dentils in Segmental Pediment.

Divide the section of the mold into an equal number of spaces, as shown by the small figures 1″, 1, 2, 3 and 4, through which points, at right angles to E F, draw lines intersecting the face of the dentil M N in section at 1, 2, 3 and 4, and the center line E F at 1′, 2′, 3′ and 4′. Using B as center and with radii equal to B 1′, B 2′, B 3′ and B 4′ draw short arc between each dentil intersecting the sides of the dentils, as shown, for example, in the dentil *d* by 1, 2, 3, 4 on both sides.

It will be noticed that the sides of the dentils intersect the moldings each at a different angle and a separate pattern is required for each side. To explain the principles we shall show how the pattern for the side *i* D of the dentil *d* is developed, which can then be applied to the other sides. Parallel to *i* D draw any line, as O P. At right angles to *i* D and from the various points *i*, 1, 2, 3, 4 and D draw lines through the line O P indefinitely. Now measuring in each instance from the line I J in the true section take the various distances to the various points in the mold, as K, 1″, 1, 2, 3, 4 and L, and place them on the lines drawn from *i*, 1, 2, 3, 4 and D in the elevation, measuring in each instance from the line O P, as shown by the points K^1, 1‴, 1′, 2′, 3′, 4′ and L^1. Then take the distances from K to M and L to N in the true section and place them from K^1 to M^1 and L^1 to N^1 in pattern for side. Trace a line through points thus obtained, then will K^1 M^1 N^1 L^1 K^1 be the pattern for the side of the dentil *i* D in elevation to fit against the circular molding on the vertical plan *i* D. In precisely the same manner obtain the sides for all the dentils *a*, *b*, *c*, *d* and *e*.

In the dentil *e* the side *m n* intersects but part of the molding, and to show this method clearly where only part of the mold is intersected proceed as follows: Parallel to *m n* draw any line, as M^2 N^2, in line with M N of the true section. At right angles to the side of the dentil *m n* and from the intersections *m*, 1 and 2 draw the lines *m m′*, 1 1^v and 2 2^v, which intersect by lines drawn from points having similar letters and figures in the true section parallel to M N, thus obtaining the intersections M^2, N^2, 2°, 1°, 1^x, K^2 and M^2 in the pattern. A line traced through these will give the pattern for the side *m n* in elevation.

The patterns for the face of the dentils should be pricked directly from the elevation; thus *i f h* D is the face pattern for dentil *d*. The pattern for the top of the dentil *d* is a square piece of metal as long as *f i* and as deep as K M in section; while the pattern for the bottom is as long as *h* D in elevation and as deep as N L in true section. In the same manner obtain the patterns for the faces, tops and bottoms of the other dentils.

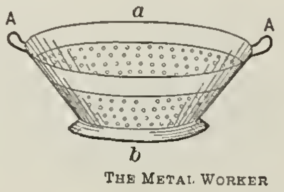
JOSEPH OAT & SON, coppersmiths, Philadelphia, Pa., will erect a new shop at the southwest corner of Bread and Quarry streets, in that city. The estimated cost is $18,000.

PATTERNS FOR COLANDER.

(Without Allowance for Laps.)

A perspective view of a colander, which is usually made from bright IC or IX charcoal tin, is shown in Fig. 1. The handles shown at A and A are tinned malleable iron handles, and are riveted to the body of the colander. They can, if desired, be made from tin plate and soldered on. A wired edge is placed at the top and at the bottom, as shown at *a* and *b*, respectively.

The patterns for the colander are obtained as shown in Fig. 2, in which first draw the center line A B, upon which place the hight of the colander, as shown by A K. Draw the desired dimensions on either side of the center line, as shown by C D, E F and G H. Extend the lines D E or C F, intersecting the center line A B at I. Now with K as center draw the semicircle 0 3 6, which divide into equal spaces, as shown by the small figures 0 to 6. Now using I as center, with radii equal to I E and I D, draw the arcs N O and L M, respectively. Now from any point, as L, draw the radial line L I, intersecting the arc N O at N. On the arc N O, starting from the point N, set off the stretchout of the semicircle 6 3 0, as shown by similar figures on N O. From the center I draw a line through O intersecting the arc L M at M.



Patterns for Colander.—Fig. 1.—Perspective View of Colander.

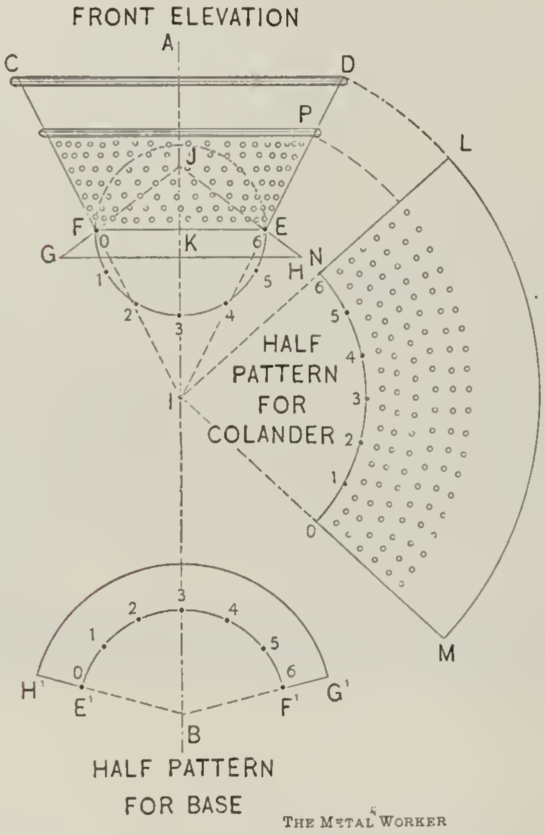


Fig. 2.—Front Elevation and Patterns.

Then will L M O N be the half pattern for the body of the colander, to which laps must be allowed for seaming and wiring.

For the pattern for the base or foot of the colander extend the lines H E or G F in elevation until they intersect the center line at J. Then with radii equal to J F and J G and with B on the center line A B as center describe the arcs E^1 F^1 and H^1 G^1, respectively. From G^1 draw the radial line to B intersecting the inner arc at F^1. Then from the point F^1 lay off on the arc F^1 E^1 the stretchout of the semicircle 6 3 0, as shown by similar figures on F^1 E^1. From the center B draw a line through E^1, extending it until it intersects the arc H^1 G^1 at H^1. Then will H^1 G^1 F^1 E^1 be the pattern for the foot of the colander. Laps must be allowed for edging and wiring. P in the front elevation indicates a small swedge, or bead, turned into the colander, below which perforations are made, which are also shown in the pattern. The bottom of the colander, which should also be perforated, is shown by the circle K.

PRODUCTION OF TIN PLATES AND SHEETS IN 1901.

The annual statistical report of the American Iron and Steel Association for 1901 has just been issued by James M. Swank, general manager of the association. It gives the total production of tin plates and terne plates for the calendar year ending December 31, 1901, as 399,291 gross tons, an increase of 96,626 gross tons, as compared with the year 1900. A table is presented showing the domestic production of tin plates since July 1, 1891, the date on which the McKinley tariff act went into effect. From that date until the close of the fiscal year ending June 30, 1897, the statistics of production of tin plates were regularly collected for the Treasury Department by Col. Ira Ayer, special agent. For the second half of 1897 and the year 1898, they were collected by *The Metal Worker*. For 1899, 1900 and 1901 they have been compiled by the American Iron and Steel Association. From the data thus obtained the following table of the production of tin plates and terne plates in the United States, including the product of tin dipping plants, in the calendar years 1891 to 1901 has been prepared.

Calendar years.	Gross tons.	Calendar years.	Gross tons.
1891 (last six months)	999	1897	256,598
1892	18,803	1898	326,915
1893	55,182	1899	360,875
1894	74,260	1900	302,665
1895	113,666	1901	399,291
1896	160,362		

The production of plate and sheet iron and steel in the United States in 1901 amounted to 2,254,425 gross tons, against 1,794,528 tons in 1890, an increase of 459,-897 tons, or over 25 per cent.

The following table gives the production by States:

States.	Gross tons.
New England	416
New York and New Jersey	6,512
Pennsylvania	1,572,500
Delaware and Maryland	29,484
West Virginia	31,928
Kentucky and Alabama	47,503
Ohio	294,266
Indiana, Illinois, Michigan, Missouri and Colorado	271,816
Total	2,254,425

The production of black plates for tinning alone in 1901, which is included in the above, was 385,026 gross tons. Of this total Pennsylvania made over 50 per cent., New Jersey, Maryland, West Virginia, Ohio, Indiana, Michigan and Missouri, also made black plates for tinning in 1901.

THE ROOFING SLATE TRADE.

Those who have been engaged in the roofing slate trade for a generation declare that never in their experience has there been such a sharp scarcity of slates as exists in the United States at the present time. The cause for this scarcity is twofold. First, the activity in building operations throughout the country has brought about a pronounced increase in the demand for slates for roofing purposes, and, secondly, the fact that the stocks at quarries have been allowed to run down in the past few years making the supply of slates unusually light. It is stated that the available stocks at quarries on January 1 of this year were 150,000 squares below the average. Moreover, there was unusual interruption in the operations at the quarries last winter. Although the quarrymen, in anticipation of a heavy building season, started into full operation rather earlier than usual this spring, they have been steadily behind their contracts and have been getting more so from week to week as the season progressed. Most of the quarries, both in Pennsylvania and in Vermont, have their product for many months to come fully booked, and from present indications it is likely that they will not be able to fill the requirements of the home trade by many hundreds of carloads this summer.

John Galt & Sons, 253 Broadway, New York, who are among the oldest and largest concerns handling roofing slates in the United States, advise us that for the past two or three months they have been absolutely unable to book any orders for spot delivery, notwithstanding that prices have advanced sharply and many of their customers are willing to pay almost anything in reason in order to obtain the necessary material to fill their contracts for slate roofing. The demand this year has covered all grades and qualities of slate. The existing scarcity applies just as much to the Northern varieties as to those of Pennsylvania. In former years there has sometimes been a shortage of some particular kinds of slate, but it has usually been made up by other kinds. But this year the scarcity of material is general.

The market for roofing slates at the present time is strong and rising. A sharp advance was made by the manufacturers a couple of weeks ago, and further advances in some kinds of slates have been announced within the past few days. The market price at the present time is governed almost entirely by the needs of consumers and the ability of the manufacturers to fill orders. Under the circumstances it is not surprising to learn that the export trade in American roofing slates has fallen off to almost the vanishing point.

W. H. Barnard & Co.

The sheet metal workers of Norfolk, Va., went out on strike this week, but the men employed in the shop of W. H. Barnard & Co. of that city, appreciating the kindly feeling that had always been displayed toward them by Mr. Barnard, refused to go out with their fellow workmen. In justifying their action in refusing to strike, the tinsmiths employed in Mr. Barnard's shop issued a statement to the public, in which they say that whenever they have been in trouble or need the firm have never denied them a favor. Several years ago they were notified that they could knock off work at 4 o'clock on Saturdays, a system which was afterward followed by all the other shops in the city. A few years later the firm, without any request being made, volunteered to allow their men to work nine hours a day instead of ten hours. This system also was then followed by the other shops in the city. The men say that they have received the highest rate of wages paid to tinners in the State of Virginia, and a number of them had their wages raised from time to time without request. They add that the prevailing number of hours of labor for a day's work in sheet metal shops for some time past has been eight hours, and in their opinion if W. H. Barnard & Co. return to the nine-hour system they will do so not in a spirit of injustice to the workmen but as a matter of business necessity. The men express their determination not to give up their employment, as to do so would stamp them as ingrates.

FLASHINGS

The United States Charcoal Iron Company, with main office at 211 Market street, Camden, N. J., have been incorporated, with a capital stock of $250,000, by J. Jones Hudson, Percy A. Marvel and John O. Wilson, to manufacture Charcoal Iron Plates.

R. Wilson & Son, Springfield, Mass., have been given the contract for the Metal Work, including Skylights, &c., on the building of the Metropolitan Furniture Company in that city. The firm are also doing the plumbing work in the same building.

The G. Bickelhaupt Skylight Works, 243-245 West Forty-seventh street, New York, are sending out a little folder descriptive of the Bickelhaupt Patent Skylight Lift, a simple device designed to ventilate the home and to obtain pure air from above through the Skylight. These Lifts can be applied to either hipped or flat Skylights. When they are closed the Skylight is securely locked.

The Youngstown Iron, Sheet & Tube Company, Youngstown, Ohio, have taken over the Alice Furnace of Pickands, Mather & Co. of Cleveland, Ohio, which has a capacity of 245 tons of Iron every 24 hours.

Beseman & Bostwick, Hartford, Conn., have been awarded the contract for the Sheet Metal work on the new residence of George B. Thayer, at West Hartford.

Encouraged by the recent increase in the demand for their product, a number of the Welsh Tin Plate manufacturers are making preparations to increase their output by the addition of new mills or remodeling of old ones.

The British Board of Trade returns on the exports of Tin Plates from British ports in the month of May show that 6540 tons were shipped to the United States, as compared with 4886 tons in May, 1901. For the five months ended May 31, 1902, the total shipments of British Tin Plates to this country amounted to 33,105 tons, as against 18,783 tons for the corresponding five months of 1901.

The Foreman Can Company, Irwin, Pa., have been incorporated with a capital stock of $22,000 by Amos L. Foreman and Benjamin M. Charles of Pittsburgh, and Frank W. Taylor and John I. Stewart of Irwin.

Work on the new eight-mill plant which the Pope Tin Plate Company are erecting at Steubenville, Ohio, is being rapidly pushed, and it is expected that it will be in shape for operation before the end of next month.

The ten Sheet mills and the forge department of the Newport Rolling Mill Company, Newport, Ky., are reported as working full time with most satisfactory prospects for the future.

Cullen & Lurie have opened a Sheet Metal working shop at 16 Mulberry street, Hartford, Conn.

The management of the Greer and Shenango works of the American Tin Plate Company, at New Castle, Pa., has given notice that these plants will probably be operated right through the summer months and that there will be no vacation allowed to the employees.

The Cedartown Tin, Sheet Iron & Bicycle Company of Cedartown, Ga., have been incorporated with a capital stock of $10,000 by J. T. McAlpin and I. P. Mee.

The hot and cold mills in the Falcon Works of the American Sheet Steel Company, at Niles, Ohio, are being removed to the Struthers Works of that concern, at Struthers, Ohio. The puddling and skelp mills in the Falcon Works will be allowed to remain there and will probably be operated by the American Steel Hoop Company, but it is possible the skelp department may be operated by the Republic Iron & Steel Company.

At the Laughlin Works of the American Tin Plate Company, at Martins Ferry, Ohio, 15 mills are being operated. This is the second largest individual tin plate plant owned by the American Tin Plate Company.

The new plant of the Griffiths Charcoal Iron Mill, at Washington, Pa., is nearly completed and will probably be in operation by July 15. This plant is equipped with forges, hammers, Bar mills and Tin mills for making Tin Plate and Terne Plate from a charcoal iron base.

The Bostwick Steel Lath Company of Niles, Ohio, have placed a contract for the erection of a new plant, which will increase their facilities considerably. Considerable new machinery will be purchased. The company held their annual meeting a few days ago and declared the usual 5 per cent. semi-annual dividend. Officers were chosen as follows: W. G. Hurlburt, president and treasurer; J. O. Hart, vice-president; E. J. Job, secretary.

The John Schwing Corporation, Bridgeport, Conn., have been incorporated with a capital stock of $5000, to manufacture Cornices, Skylights and all kinds of Architectural Iron and Copper Work. The company are successors of John Schwing, who has carried on a similar business at 234-236 Stratford avenue, Bridgeport, for some years past.

The Buckeye Stamping Company of Columbus, Ohio, have been organized with $20,000 capital stock by E. C. Derby, J. C. Burns, W. T. Smith, P. A. De Long and C. A. Morningstar. They will make Tin Cans, Tin Boxes and Metal Specialties.

The Supply Meetings at Niagara Falls.

For the second time the Eastern and Western manufacturers and dealers in plumbing goods and supplies have held a joint meeting. The first meeting took place about a year ago at Detroit. The Central Supply Association had arranged to hold their quarterly meeting in that city, and the Association of Manufacturers and Jobbers of Plumbing Supplies issued a call for a meeting at the same time and place. This year the Western body accepted the invitation of the Eastern body to meet with them at Niagara Falls, N. Y., on June 24. The result was a new record in the matter of attendance, which far surpassed the number at the meeting in Detroit. A partial list of those who were at Niagara Falls includes the following:

Harry S. Martin, Dunkirk, N. Y.
Fred. W. Smith, Dunkirk, N. Y.
A. D. Sanders, Chicago.
J. M. Young, Pittsburgh.
A. C. Cogswell, Detroit.
W. B. Hubbard, Boston.
E. E. McNair, Buffalo.
C. H. Rose, New York.
Wm. H. Haines, Philadelphia.
W. C. Rumsey, St. Louis.
F. M. Knapp, Pittsburgh.
C. K. Foster, Chicago.
Frank T. Bassett, Boston.
E. R. Stoughton, Buffalo.
W. A. Myler, Pittsburgh.
Arthur M. Parker, Detroit.
W. G. Cook, Trenton, N. J.
F. V. Bartlett, Detroit.
E. V. Skinner, New York.
John E. Fitzgerald, Pittsburgh.
A. F. Blesch, Detroit.
M. W. Sales, Detroit.
A. I. Lewis, Detroit.
James Harvey, Detroit.
John Walker, Detroit.
George F. Hughson, Chicago.
H. L. Andrews, Pittsburgh.
George I. Blowers, New York.
George S. Owens, Detroit.
William B. Blowers, Mansfield, Ohio.
J. E. Mohler, Baltimore.
Wm. F. Morgan, Chicago.
F. J. Knox, Hartford.
F. R. Dengel, Milwaukee.
J. P. Rundle, Milwaukee.
A. Y. MacDonald, Dubuque.
A. F. Gartz, Chicago.
J. E. Holland, Chicago.
George H. Tompkins, Chicago.
W. E. Clow, Chicago.
Paul Blatchford, Chicago.
N. W. Blatchford, Chicago.
J. K. Allen, Chicago.
Henry Stein, New York.
W. E. Sloan, Rochester.
B. O. Tilden, Detroit.
Wm. McShane, Baltimore.
A. E. Douglas, St. Louis.
E. Morris, Detroit.
J. F. Grosswiller, Toledo, Ohio.
W. G. Radcliffe, Cleveland.
A. M. Mueller, Decatur, Ill.
M. W. Mueller, Decatur, Ill.
G. A. Caldwell, Decatur, Ill.
G. H. Merkel, Cincinnati.
A. Fowle, New York.
N. O. Nelson, St. Louis.
I. N. Glauber, Cleveland.
C. J. Hills, Haydenville, Mass.
S. O. Dugger, Chicago.
J. P. Dugger, Chicago.
W. B. Tracy, Chicago.
Wm. M. Webster, Chicago.
John T. Wolff, Chicago.
Herman Hoelscher, Chicago.
J. J. Ryan, Chicago
Wm. T. Doyle, Milwaukee.
J. B. Kalvelaze, Milwaukee.
E. F. Niedecken, Milwaukee.
C. W. Woodward, New York.
Frank S. Hanley, New York.

THE BRASS MANUFACTURERS' ASSOCIATION.

The first meeting at Niagara Falls was that of the Brass Manufacturers' Association, which was opened on Monday, June 23, by President A. D. Saunders. On the roll call by Secretary William T. Doyle a large attendance was noted. This meeting, like all the others, was open to members only; but the subject of the discussions, it was learned, had reference to the conditions prevailing in this branch of trade and efforts for the elimination of bad practices and to secure united effort for the betterment of the trade. Some time was given to a new classification of brass goods, which some of the members stated would effect a slight advance in prices, amounting on the average to about 2½ per cent. After adjournment there was evidence that the deliberations of this body of tradesmen had been satisfactory.

THE ASSOCIATION OF MANUFACTURERS AND JOBBERS.

On Tuesday morning, June 24, President Frank J. Knox called to order a meeting of the Association of Manufacturers and Jobbers of Plumbing Supplies in one of the ballrooms of the Cataract House. The report of Secretary C. W. Woodward showed a good attendance. While various matters of interest to the association received attention the greatest interest centered in the report of the Conference Committee, which had met with a like committee from the National Association of Master Plumbers at Atlantic City on June 13. The report was discussed, and the action of the committee indorsed.

THE CENTRAL SUPPLY ASSOCIATION.

In another of the large ballrooms of the Cataract House on Tuesday morning the Central Supply Association held a meeting with President E. Morris in the chair. Secretary Paul Blachford brought to the attention of the association the different communications that had been received since the last meeting, and after these and some special matters had been disposed of, the report of the Conference Committee was heard with close attention and the action of the committee approved.

THE JOINT MEETING.

On Tuesday afternoon the members of the Association of Manufacturers and Jobbers and of the Central Supply Association held a joint meeting, presided over by E. Morris, for the purpose of hearing and acting upon the report of the Conference Committee. This report was made by Frank J. Knox, who had acted as chairman at the conference at Atlantic City, and was supported by William H. Haines, G. H. Merkel and J. B. Rahm. The report was discussed and indorsed, and the chairman was instructed to communicate the result immediately to President Hornbrook of the National Association of Master Plumbers. As far as can be learned, the conference has not definitely changed the conditions obtaining previous to the sitting of the committee, although it is clear that the disposition of the two bodies to confer has been improved.

THE PRESS.

This is the first meeting of the supply associations to be generally attended by representatives of the trade press. As the meetings have no open sessions, they merely afford opportunities for extending and renewing acquaintance. *The Metal Worker* was represented by Frank K. Chew, *Domestic Engineering* by John K. Allen and E. Crawford, *The Plumbers' Trade Journal* by James M. Heatherton, A. A. Ainsworth and E. H. Southworth and the *Engineering Review* by Chauncey L. Williams, S. D. Bruce and L. D. Collins.

THE GOLF TOURNAMENT.

Owing to the fact that so many members of the association are golf players, and that the different meetings afford opportunity for a little relaxation from the strain of business demands, the Trade Golf Association was formed. Through the efforts of the secretary, Chauncey L. Williams, 910 Kedsie Building, Chicago, the links of the Niagara Falls Golf Club were secured for a tournament. After the preliminary trials for classification, the various pairs started in to compete for the different prizes with the following result:

S. O. Dugger won a very pretty silver cup presented by the *Engineering Review* for the best score for the first 18 holes played. Mr. Dugger also won the Association Challenge Cup, which must be won three times to become his property, beating A. Y. MacDonald, who secured a silver medal presented by the Crane Company.

J. B. Rahm won the silver cup presented by *Domestic Engineering*, beating J. P. Dugger, who secured another of the silver medals presented by the Crane Company.

The very pretty cup, of a design to attract the golf player, presented by the United States Radiator Company, was won by Chauncey L. Williams, while his opponent, F. W. Smith, won one of the Crane Company's bronze medals.

Harry S. Martin won the silver cup on an ebony pedestal presented by *The Plumbers' Trade Journal*, and E. R. Stoughton was pleased to get a Crane Company's bronze medal.

A. I. Lewis successfully contested with Paul Blatchford for a Crane Company bronze medal against the John Davis Company prize of a dozen golf balls.

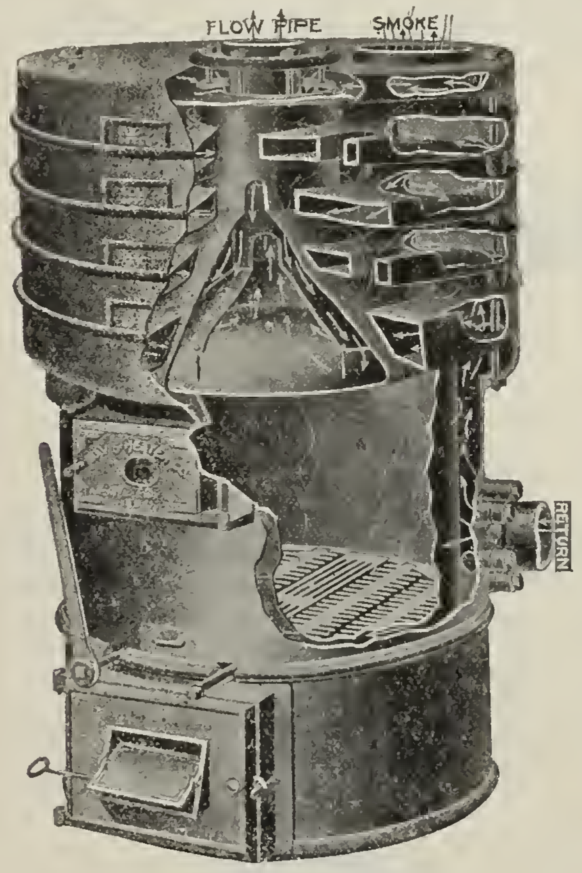
A. A. Ainsworth tells a golf story of how he had Murray Sales beaten in the sixth flight, but got into the furze, and Murray now wears a Crane Company bronze medal. Sam Dugger swatted a ball 195 yards and won the driving contest and a dozen golf balls presented by the John Davis Company.

This outing closed a very enjoyable joint meeting of the supply associations.

The Journeymen Plumbers' Association of Geneva, N. Y., have instituted proceedings against Mayor Daniel E. Moore to compel him to appoint a Board of Examining Plumbers. The City Attorney claims that the law requiring the examination of plumbers has been repealed, but the counsel for the plumbers holds that it is still in full force and that it is the duty of the Mayor to make the appointment asked for by the plumbers. Mayor Moore thinks that the city is not large enough to need such a board and that the expense of its maintenance would be an unnecessary burden.

The Davis Hot Water Heater.

The Davis Heater Company of Racine, Wis., are now manufacturing the Davis Heater, of which a broken view is presented herewith. In explanation of the operation of the heater, which will be readily apprehended by means of the accompanying view, the company state that the water, after entering the apparatus, flows around the fire pot and around the sections up to the top of the heater. From there it drops down through the drop tube and comes in contact with the crown sheet, which is immediately over the fire, where it is exposed to the maximum of heat that is in the fire. Moreover, all the water must come in contact with this heat. In most of the ordinary types of heater—viz., those built up of water sections placed one above another, with holes for the water to pass up from one section to another—only the water in the section immediately over the fire pot can get the intensest heat of the fire. It is in this particular that the Davis Heater differs from others and secures a decided advantage over them, as by the arrangement of the apparatus all the water passes directly over the hottest section of the fire. These heaters are designed for the warming of buildings of every description, and the manufacturers say that a number of them have been installed in different places throughout the country from Providence, R. I., to Denver, Col., and from Marquette, Mich., to Savannah, Ga. Further information regarding these heaters will be cheerfully furnished by the company on application. The Davis Heater Company also manufacture heaters for warming water for domestic purposes, natatoriums, baptisteries, &c.

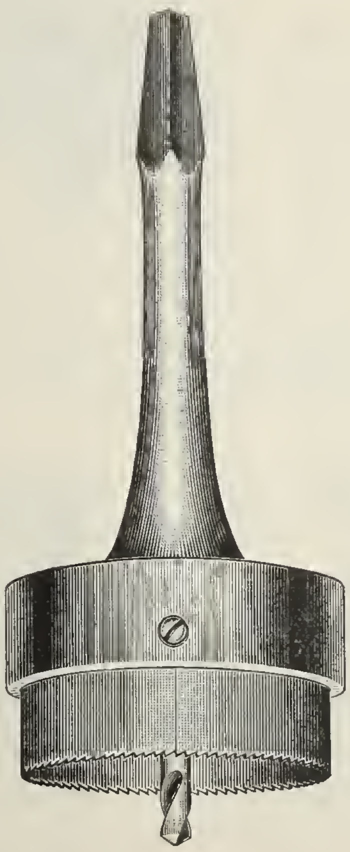


The Davis Hot Water Heater.

The new Board of Plumbing Examiners appointed by Mayor Phillips of Springfield, Ill., is composed of Plumbing Inspector Frank W. Patterson, representing the Board of Health; Leon P. Hopkins, representing the master plumbers, and D. C. Seagraves, representing the journeymen plumbers. The board has been given quarters on the City Hall. Each applicant for a plumber's license will be compelled to secure a percentage of 70 per cent. in an examination in both theoretical and practical work. It is expected that the board can accomplish much good in wiping out incompetent workmen. The fee for a certificate for a master plumber is fixed at $5, and for a journeyman at $1.

The Plumbers' Hollow Mill Saw.

The accompanying cuts relate to plumbers' hollow mill saws offered by the West Haven Mfg. Company, New Haven, Conn. The tool is intended for use in an ordinary bit brace, and is designed to make holes in waste pipes and stacks the exact pipe size for tapping in any material or for any connections where the pipes or appliances are already placed, often saving, it is stated, the cost of tearing out whole lengths of pipe with their expensive connections. It is explained that the tool obviates the use of a saddle hub in a great many cases and reduces the work of applying one to the minimum where it is required; also that in cases of stoppage in waste pipes a hole can be cut out and afterward plugged. The tool, it is pointed out, will often save the cost of taking nearly finished jobs apart and carrying a portion to the workshop. The tool is made in five sizes—1, 1¼, 1½, 2 and 2½ inches—and packed in a wooden case, together with one extra set of saws and two drills with each set.



The Plumbers' Hollow Mill Saw.—Fig. 1.—General View.

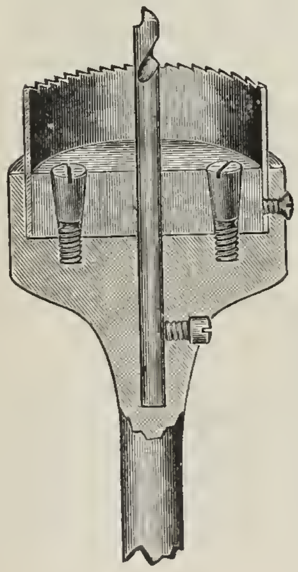


Fig. 2.—Construction of Plumbers' Hollow Mill Saw.

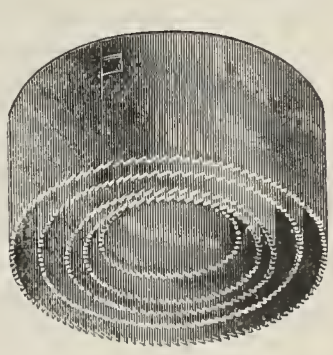

Fig. 3.—Extra Saws.

The contract for the plumbing and heating of the St. James' Roman Catholic School, Grand Rapids, Mich., has been awarded to Weatherly & Pulte, of that city.

New Combination Pipe and Monkey Wrench and Pipe Cutter.

The Bonney Vise & Tool Works, Incorporated, Philadelphia, Pa., are placing on the market a new combination pipe and monkey wrench and pipe cutter, as shown in the accompanying illustrations. It is provided with a toggle jaw to make a sure grip and secure instant release. By withdrawing the pin and reversing the toggle jaw the tool is in shape for use as a pipe cutter, which reversal can be made in a few seconds. By throwing the toggle up at right angles with the wrench, as shown in Fig. 2, the pipe can be lifted out of the V without running the jaw back, which is referred to as a great saving of time. This feature is also applicable to the use on different sizes of pipe, whereby 1 or 2 inch pipe can be handled with little change in the position of the jaws. The tool is furnished in black or bright finish, with long or short nut, and in sizes that will take pipe from ¼ to 3 inches in diameter. The head and bar of the wrench are alluded to as a one-piece forging, made from the best material, and all parts are interchangeable. The company claim that the wrench not only combines the superior qualities of a gas pipe wrench, but also the requisite combinations of a regular nut wrench and pipe cutter.

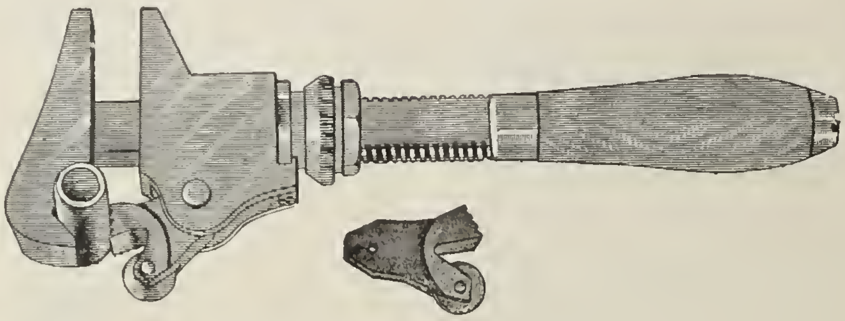

Fig. 1.—New Combination Pipe and Monkey Wrench and Pipe Cutter.

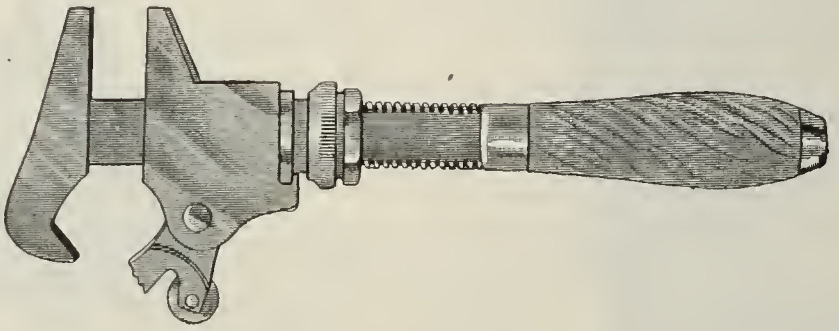

Fig. 2.—The Toggle at Right Angles with the Wrench.

Galvanized Steel Chain Pump Tubing and Steel Curbs.

The accompanying cuts relate to galvanized steel chain pump tubing and steel curbs offered by the St. Joseph Pump & Mfg. Company, St. Joseph, Mo. The tubing shown in Fig. 1 has an inside diameter of 1⅝ inches, and is made in lengths of 6, 8 and 10 feet. It is referred to as being true and accurate, with malleable screw couplings, while the reservoir has malleable iron ears for protection, through which a wrought iron stirrup protrudes to assure the secure fastening of the tubing to the pump. The ears are riveted on to the reservoir, after which the pipe is galvanized. The box of the curb shown in Fig. 2 is made of No. 22 galvanized steel, painted two coats, stenciled and varnished. It is provided with malleable iron rims on the top and bottom. The manufacturers remark that, unlike wood tubing, which becomes slimy, filled with bacteria, smelling badly and often tainting the water, galvanized steel tubing remains clean and wholesome. Rubber buckets are preferred for use in this tubing, and it is pointed out that the buckets will last longer than in wooden tubing, because the hole is perfectly smooth and does not wear larger and let the water run back. The large reservoir at the top prevents the water wasting.

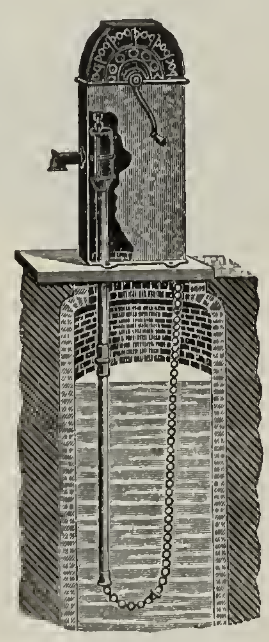

Fig. 2.—Steel Pump Curb.

Fig. 1.—Galvanized Steel Chain Pump Tubing.

New York City Notes.

The delegates to the national convention all arrived home safe and sound on Saturday last. They all express themselves as pleased with Atlantic City as a convention place, and also with the general results of the convention.

* * *

President Hornbrook and staff, together with several Western and Southern delegates, paid a visit to the city, and with Messrs. I. J. Brown, Donohoe, E. J. Brady, Gaynor and some others, made a trip to Manhattan Beach and Coney Island last Sunday. It is needless to say that they had an enjoyable time. Tuesday evening I. J. Brown entertained a number of the visitors at his residence.

* * *

The coal strike has caused some of the large building operations on hand to slow down, owing to the inability to get iron work as needed. This has caused delay with several of the plumbers.

* * *

The Board of Education is behind time this summer in giving out vacation repair jobs. Many plumbers who do this particular kind of work are waitng for plans to figure on.

* * *

Rossman & Bracken have the plumbing contract on the Hospital Building of the Woman's Reformatory, at Bedford Station, and have a force of men at work on the same.

* * *

Bronx Branch are going to give their first annual outing at Lohbauer's Park, Westchester, on Thursday, July 17. The committee in charge are: J. P. Muller, chairman; D. L. Delaney, D. Durie, Jr., J. V. McEvily and J. W. Sweeney. Returns for tickets can be made before July 10 to J. W. Sweeney, 2864 Webster avenue.

* * *

Among the busy plumbers are John Hogan, with the new Hall of Records at Chambers and Centre streets; E. J. Hurley, with an apartment house on Eighty-second street between Broadway and West End avenue; Stroh & Huber, with an apartment at 124-126 West Forty-seventh street; W. M. Beigan, who is plumbing a storehouse at 527-531 West Thirty-sixth street, while Charles Hensle, in addition to his other numerous jobs, is just starting an apartment on 131st street, between Fifth and Lenox avenues.

* * *

Fred. Turkowsky of 28 Second avenue has a good overhauling job in the Post Graduate Hospital, at Second avenue and Twentieth street, where he is putting in some new closets, sinks and needle baths, and J. W. Cooney has quite a job at Tottenville, S. I., fitting up the reception house of the St. John's Guild.

* * *

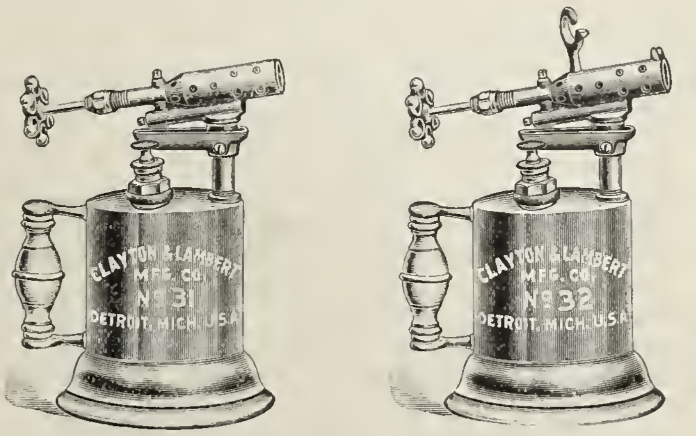
Among the new jobs lately given out, Jos. Bloch has a tenement at Twenty-ninth street and Second avenue and another on Eighty-fifth street, near Third avenue; Elias Myers is plumbing a dancing pavilion and hotel that are being erected at Eighth avenue and 155th street, and Spencer & Polacheck have a large apartment house on Ninety-fourth street, between West End avenue and Riverside Drive.

New Sanitary Ware Pottery.

The Fidelity Pottery Company of Trenton, N. J., have been organized, with Charles H. Baker as president and J. H. Cogill as secretary and treasurer, and have purchased the plant formerly operated by the Egyptian Pottery Company. The plant will continue, under entirely new management, the manufacture of sanitary earthen ware of a superior quality, embracing all the latest designs and made from the most approved models. The company say that only the very best goods will be shipped from this plant, that high grade materials will be used exclusively, and that the utmost care and skill will characterize the manufacture of their goods. They will manufacture a complete general line of sanitary ware on the standard list, and from time to time such specialties will be added as the trade may demand or suggest. The company promise careful attention to the needs of the trade, and assure their patrons that all orders or inquiries shall have personal and prompt attention, thus hoping to secure a goodly portion of the patronage of the jobbing trade, to which they will sell exclusively.

Two New Gasoline Torches.

The Clayton & Lambert Mfg. Company, Detroit, Mich., have added two more gasoline torches to their line, designated as No. 31 and No. 32, which we present in the accompanying illustrations. The No. 31 torch shown in Fig. 1 is designed for the use of mechanics who desire a powerful burner, capable of doing heavy work out of doors in cold or windy weather. The manufacturers claim that the generator has unusually great generating power, and that it will produce a clear, blue, intensely hot flame which is under the perfect control of the operator, and that it is very economical in the use of gasoline. The tank is of quart size, drawn out of heavy brass and free from seams. All the fittings are heavy, reinforcements being used to make a strong tank. A brass air pump of the latest design screws into the tank and is submerged in gasolene, which aids in keeping it cool and also protects it from injury. The torch is supplied in polished brass or nickel plated as desired. The No. 32 torch shown in Fig. 2 is exactly like the No. 31, except that a hook and support are provided, so that soldering coppers may be heated. This makes it peculiarly adapted to the use of repair men and mechanics who are called upon to do work of this kind. These torches are claimed to be of first-class workmanship and good material, and they are sold under the broadest kind of guarantee.



CLAYTON & LAMBERT MFG. CO. No 31 DETROIT, MICH. U.S.A.
CLAYTON & LAMBERT MFG. CO. No 32 DETROIT, MICH. U.S.A.

Fig. 1.—No. 31 Torch. *Fig. 2.—No. 32 Torch.*

Two New Gasoline Torches.

Queens Borough Plumbers' Outing.

Queens Branch of the New York Master Plumbers' Association gave their annual outing on Thursday, June 26, at Donnelly's Grove, College Point, L. I. The committee in charge was comprised of Messrs. Gross, Perry and O'Connor. The association was well represented by members from Long Island City, Newtown, Flushing, the Rockaways, Jamaica and other places in the borough.

The bowling prizes were won by George Gross, with a score of 113; Tom Freeman, with 112; J. H. Cornell, with 109, and Geo. Schultz, with 103. The ladies' bowling tournament was won by Mrs. George Gross, Mrs. Reising and Mrs. Kumpfer. A six-innings ball game was played between the plumbers and the supply trade. Batteries: Plumbers, Cornell and Gaeby; Supply Trade, Brown and Ruhland. The score was 26 to 13, in favor of the plumbers.

Among the guests present were Messrs. I. J. Brown, B. F. Donohoe, F. F. Gaynor and John Renehan of Manhattan, and D. Donegan, Ed. Macdonald and G. W. Smith of Brooklyn. The supply trade was also well represented.

Heating and Plumbing Notes.

The Southern Heating Company, Memphis, Tenn., have been awarded the contract for a low pressure steam heating apparatus in the Kortrecht Building, in that city, at their bid of $1891.

The Plumbers' Laborers' Union of St. Louis, Mo., and vicinity have been granted their demand for an increase in the wage scale to $2.80 per day, the rate to be in effect for two years from June 20.

The strike of the plumbers of Youngstown, Ohio, which was initiated on May 1, has been settled and the men have returned to work. The details of the settlement have not been published, but it is understood that it was made on the basis of mutual concessions by the master plumbers and the journeymen.

The journeymen plumbers of New Haven, Conn., have reorganized and elected John Roches as president, James Tiernan as vice-president, Patrick O'Meara recording secretary, M. A. Turbot financial secretary, and John Shevlin treasurer.

James A. Trane of the James A. Trane Vacuum Heating Company of Chicago and E. P. Allen of the Norwall Mfg. Company of that city, who have been in the East attending the different conventions at Atlantic City, were visitors at *The Metal Worker* office this week. The new devices which they brought to the attention of the delegates received more than passing notice.

The Gurney Heater Mfg. Company, 74 Franklin street, Boston, Mass., are sending to those who did not find it convenient to enjoy attending the different conventions at Atlantic City, a very attractive souvenir circular in the interest of their goods. It is in the form of a folder showing on the front page an hour glass, snuffers and a candle, while on the back page is a picture of a candle in an old-fashioned candlestick with the injunction "Keep it Burning." When the folder is opened it is clear that it is intended to give "a little light" in regard to the economy of operation and the durability of the Gurney Boilers and Radiators, and also the facility with which these Boilers can be set up. "A little light" is also shed upon the company's Narrow, Duet and Tremont Radiators made in different hights and in one, two and three columns. This card is well calculated to attract attention, and those who desire more detailed information can secure it by asking for a catalogue, giving full particulars in reference to the company's goods.

William A. Lowe, one of the leading plumbers of Portland, Maine, died in that city on June 18. He was born in Bristol, Maine, 60 years ago, and when 20 years of age went to Portland, where he entered the employ of S. D. Merrill, then the leading plumber of Portland. In a few years he bought out Mr. Merrill and went into business for himself, conducting it successfully up to the time of his death. Mr. Lowe leaves a widow and one daughter.

The strike of the gas fitters employed by the Hudson County Gas Company, Jersey City, N. J., has been settled by an advance of 25 cents per day in wages.

The strike of the journeymen plumbers at Plainfield, N. J., has been settled and the men have returned to work. By the terms of the agreement the journeymen will receive $3.25 per day, an increase of 25 cents over their former wages, but 25 cents less than the amount demanded.

A 50-year franchise has been granted by the City Council of Clarksville, Tenn., to the Clarksville Street Steam Heating Company. According to the terms of the franchise the plant must be in operation in two years' time, otherwise the franchise will be forfeited. The company are also limited to the use of steam and hot water for heating purposes.

An amendment to the city ordinance has been adopted by the City Council of New Britain, Conn., making master plumbers take out a license before August 1, 1902, and placing the fee for such license at $1. Violations of this ordinance are subject to a fine not to exceed $50.

C. H. Julian of San Diego, Cal., has been awarded the contract for the plumbing work on the new United States Quarantine Station at that place.

H. C. Clark of Delaware City, Del., has been awarded the contract for plumbing the Fort Des Moines Army Post, Des Moines, Iowa, at his bid of $9000. The steam heating contract has been awarded to Harris & Algor of Camden, N. J., at $6000.

An ordinance has been passed by the City Council of Galesburg, Ill., providing that licenses shall be issued to the present licensed plumbers without fee to the city. New plumbers, however, are required to be examined, and if admitted, to pay a fee of $5 to the city. The old city ordinance has been amended by striking out the section requiring a license fee of $20, to be paid by sanitary plumbers and by plumbers working at the city water works.

Riley Brothers, Lawrence, Mass., have been awarded the contract for plumbing the new addition to the Orphan Asylum in that city.

Bids will be received until July 9 for the plumbing of the Post Office Building at Winnipeg, Man. The form of tender, together with plans and specifications, can be obtained from the Public Works Office, Post Office, Winnipeg, and at the Department of Public Works, Ottawa, Canada.

The plumbing and ventilating systems of the United States ships "Raleigh" and "Detroit," now at the Charlestown Navy Yard, Boston, are said to be the best and most elaborate installed on board United States war ships. The work is being done under the supervision of Leading Ship Plumber Charles Drake of the Construction Department at the Navy Yard.

The plumbing and steam fitting establishment of John B. Smith & Co., Lewiston, Maine, was badly damaged by fire on the morning of June 17. The loss is estimated at $5000 on the stock and $5000 on the building, both building and stock belonging to the company. The origin of the fire is believed to be incendiary. The loss is reported to be covered by insurance.

Francis Brothers & Jellett of Philadelphia will install a steam heating system, costing $9800, in the Jewish Hospital in that city. The firm have also been given the contract for a steam heating and electric plant, costing $14,000, including one high pressure boiler and three cast iron hot water heaters, in a house on Greene street, Germantown, Pa., and one for a similar plant, to be installed at the factory of the E. G. Chester Company, Cedar and Huntington streets, at a cost of $14,000.

The new plant of the Gadsden Pipe & Foundry Company, Gadsden, Ala., was placed in operation last week. The company have a large number of orders on their books, and it is likely that they will be forced to increase their facilities in the near future.

The contract for heating the new school house of the Eighth Street Lutheran Church, Oshkosh, Wis., has been awarded to W. S. Patterson of Appleton, Wis., at his bid of $2625.

Francis G. Ward, Commissioner of Public Works, Buffalo, N. Y., has advertised for bids, to be received until July 2, for the plumbing work, including labor and material, for the new Shelter Houses on the Johnson Street, Broadway Market, and Hamburg Canal playgrounds in that city.

The Aermotor Company, Chicago, are sending out a new catalogue and price-list of Aermotors, Aermotor Cylinders, Bell Towers, Pumps, Tanks, Valves, &c.

The differences which existed between the master and journeymen plumbers of Bridgeport, Conn., resulting in a strike of over six weeks' duration have been settled by arbitration, and the men have returned to work. The settlement provides for a minimum wage of $3 for an eight-hour day to men who have worked at the trade for six years or more; to those who have worked for less than six years and more than two, $2.50, and for apprentices just out of their time $2.

For work performed on legal holidays double time is to be paid, and for work after 5 p.m., time and a half. One apprentice is allowed for every two men, and one for every three additional men. The agreement is to be effective for three years.

We have received from the Thomas P. Ford Company, 81 Centre street, New York, a hanger which will be found useful for reference by those to whom it is sent. The main part of the sheet, which is 22 x 23 inches in size, is occupied by a colored map of the world, with the various steamship routes traced in red, and the distances in miles between the various ports. The map is surrounded by pictures of the flags of all nations in their proper colors, and the space at the top and bottom is devoted to views of some of the Ford Steam and Water Specialties for steam heating, power and plumbing systems, manufactured by the concern, including their Standard Pump Regulating Valves, Balanced Tank Valves, Steam Separator and the Ford System for Controlling Elevator and Fire Pumps. A note at the bottom of the hanger invites the trade to send for a catalogue of the products of the concern. The sheet is bound with brass at top and bottom, with a brass eyelet for hanging.

The contract for plumbing and steam heating the new Armory to be erected on McKinley avenue, Norwich, Conn., has been awarded to the Vanderman Plumbing & Heating Company of Willimantic, Conn.

In addition to the three public baths for which the Board of Estimate and Apportionment of New York City has appropriated $325,000, a large public bath is to be constructed on the East Side, as a private gift. Mrs. A. A. Anderson has purchased two old buildings at 325 and 327 East Thirty-eighth street, on a plot, 60 x 100 feet, which will be utilized as a site for a large model bath house for the poor.

The Buckingham-Routh Company, New Haven, Conn., have been awarded the contract for the plumbing in the new building recently erected in that city by the Bigelow Company.

Sealed proposals will be received until July 1 by the Committee on Property at the office of the Board of Education, Room 292, City Hall, Philadelphia, for heating and ventilating the Newton Girls' Grammar School in that city.

The Supervising Architect of the Treasury Department, Washington, D. C., has invited estimates for furnishing and installing a heating plant in the Post Office Building at Brunswick, Ga. Bids must be sent in before August 5.

Otto Eppstein, Hartford, Conn., is doing the plumbing work on four new houses which Nevels Brothers are erecting on Deerfield avenue in that city. P. E. Greene has the heating contract for two of the houses and George M. Couch for the other two.

Plans and specifications for the buildings for the Pittsburgh Valve & Fittings Company's plant at Barberton, Ohio, have been completed, and it is expected that the contracts will be let very shortly, as the promoters of the enterprise are anxious to hurry along the work. It is understood that the plant will consist of six buildings—an iron foundry, 60 x 300 feet; a casting department, 40 x 100 feet; an iron tapping department, 40 x 200 feet; a brass finishing department, 40 x 200 feet, and a buffing and nickel plating building, 40 x 200 feet, as well as three large storage buildings. The siding and spur tracks, from the Erie Railroad lines, through the company's property have been completed.

William T. Disley, Waterbury, Conn., has the contract for plumbing a new block for Mrs. Cornelia A. Buell. Mr. Disley is also doing the metal roofing work and plumbing on the large new factory for the Eagle Lock Company, at Terryville, Conn.

The Moline Heating & Construction Company, Moline, Ill., have secured the contract for the plumbing of the new Manufacturers' Hotel in that city.

The plumbing shop of George A. Wilson, 73 Essex street, Boston, Mass., was slightly damaged by fire on June 23.

E. F. Ziegler, Waterbury, Conn., has the contract for plumbing a block on Canal street for A. Russo. He also has in hand a number of other jobs of residence plumbing in Waterbury.

The McIntosh Hardware Company, Kalispell, Mont., have been awarded the contract for heating and plumbing the new County Court House and jail in that town, at their bid of $5370.

In *The Metal Worker* of June 21 an error was made in stating that W. M. Sardou attended the Steam Fitters' Convention as a representative of the Armstrong Stove Company of Baltimore, Md. Mr. Sardou attended the convention in his own interests.

The Bigelow Self Closing Faucet was exhibited at the plumbers' convention at Atlantic City last week by the Garnett Valve Company of 40 Dearborn street, Chicago, and a little pamphlet, entitled the "Faucet Problem Solved," enabled the plumber to study its features at leisure.

New Firms and Changes.

The William H. Curtin Mfg. Company of Brooklyn, N. Y., have been incorporated with a capital stock of $25,000 to manufacture Plumbing Supplies. The directors of the company are: William H. Curtin, Diedrich Wolf and G. F. Diack, Brooklyn.

The Victoria Acetylene Company of Auburn, Maine, have been incorporated with a capital of $200,000 for the manufacture and sale of machines and appliances for distributing light, heat and power. The president of the company is E. S. Larrabee, and the treasurer H. W. Oakes, both of Auburn, Maine.

Andrew R. McCallum and Fred. C. Cook of Abington, Mass., have formed a partnership for the manufacture of the Lightning Steam Heater, of which Mr. McCallum is the inventor.

The Clarksville Steam Heating Company, Clarksville, Tenn., have been incorporated by M. L. Rudolph, A. R. Gholson, C. C. Gerhart, H. M. Dunlop and E. C. Morrow.

The firm of J. E. Keyes & Co. of Little Rock, Ark., have been incorporated by J. E. Keyes, W. S. McDonald and J. M. Gowdy for the purpose of doing a general plumbing and gas fitting business.

Gould & Nolan, Bath, N. Y., have discontinued the branch plumbing store at Hammondsport, N. Y., which they have conducted there since 1896.

Charles W. Newman has bought the plumbing business of William H. Deisseroth at 257 Broadway, Newburgh, N. Y., and will continue it at the same location.

The T. A. Gillespie Company are erecting at Paterson, N. J., a new Pipe plant, the principal building of which measures 150 x 300 feet. They will manufacture the Ferguson Lock Joint Pipe, which first became prominent in the construction of the West Australia water system for supplying the Coolgardie gold fields. This Pipe is particularly applicable for high pressures and will be made in sizes from 20 inches in diameter up. It is expected that the new works will be in operation early in the fall.

The Steele & Robinson Company, Williamsport, Pa., have been incorporated under the laws of Pennsylvania. The company are erecting a plant for the manufacture of a full line of Steam and Hot Water Boilers and Radiators. Their foundry is 100 x 150 feet, and the machine shop 100 x 160 feet. The works are located alongside the track of the Pennsylvania Railroad, while the Reading Railroad is within a short distance. The officers of the company are: George P. Steele, president, and William J. Robinson, secretary and treasurer. The concern have an office at 631 Arch street, Philadelphia.

The Montross Metal Shingle Company, Camden, N. J., refer to their present output of Metal Shingles and Tiles as the largest since they started in business. Owing to the increased demand new machinery has recently been added to the plant. Among orders lately received have been many from foreign countries, including Africa, South America, New Zealand, Mexico and others.

THE LETTER BOX.

Inquiries in regard to practical questions of general interest are invited, in reply to which we shall be glad to receive suggestions and information from our readers.

Correspondents are requested in all cases to give their names and addresses, which will not, however, be published or disclosed without their consent.

DESIGNING HAMMERED ROSETTES.

From M. W., Brooklyn, N. Y.—I have an order to make about 200 rosettes which I wish to raise out of scrap galvanized iron. Please let me know how to get the pattern for a rosette having eight scallops, to be 4 inches in diameter and raised 1½ inches deep, as shown by the inclosed sketch. What size of raising hammer should be used and how many can be raised at one time? Can you tell me how to make a drawing showing the correct appearance of the rosette as viewed from the side, and how to develop the pattern from this?

Answer.—It is generally understood among workers in this line that accurate patterns for work requiring much hammering cannot be cut, since the stretching of the metal in the process of raising may be more or less, according to circumstances, and the necessary amount of allowance can only be determined by experiment. But while this is true, it is not a difficult matter to construct, from given data, correct front and side elevations of any design which will show how it will look when finished. Such drawings will aid materially in determining whether the design as previously conceived will be satisfactory or whether some alteration must be made before going ahead with the work. Furthermore, with accurate drawings of the completed design at hand, from which definite measurements can be made, the workman can make such allowances for the stretching or drawing in of the metal as will enable him to lay out a fairly accurate blank. And with such an approximation to start with (inasmuch as our correspondent has a large number to make) one or two experiments in raising should enable him to produce a very accurate blank.

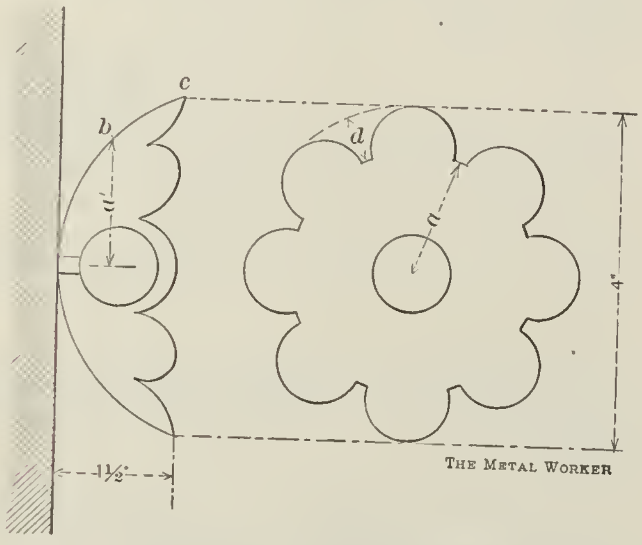


Fig. 1.—Reproduction of Sketch Submitted by "M. W."

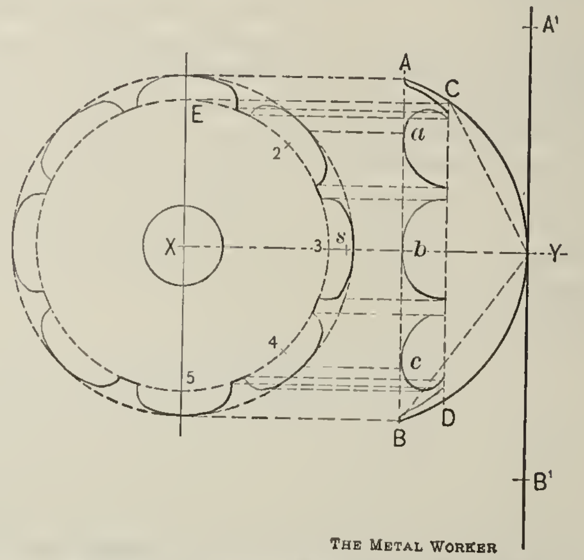

Fig. 2.—Method of Constructing Correct Front and Side Elevations of Hammered Rosette.

DESIGNING HAMMERED ROSETTES.

Fig. 1 of the annexed drawings is an approximate reproduction of our correspondent's sketch, in which we infer that the scallops are drawn about as he expects to see them "in the flat," or before the metal is raised or dished to the curve shown in the sectional view at the left. Inasmuch as corresponding points in the two views must be at the same hight or distance from the center of the design, it will be seen that, if the scallops as drawn were accepted as the correct front elevation, the distance of its deepest part from the center, shown by *a*, would if set off in the profile, show that point to be at *b*, and the depth of the scallop to be *b c*. This distance is much greater than its width, on account of the obliquity of the metal at the edge, and would produce a scallop of oval shape, which we do not think is intended.

In Fig. 2 we show a front and a side elevation of the rosette with a scallop of the approximate size of that shown in Fig. 1, which may be drawn in the following manner: First draw a circle showing the extreme size (4 inches) of the rosette: and, with its centers on the same horizontal line, draw the profile of the side view to correspond with that of Fig. 1, terminating it at A and B by horizontal lines projected from the top and bottom of the elevation. From A set off the depth of the scallop, as measured at *d* of Fig. 1, and shown by C of Fig. 2, and draw the vertical line C D. Next project a line from C to the center line of the front view, as shown by C E, and with the radius X E draw the dotted circle shown. Divide this circle into as many spaces as the number of scallops required (eight), locating the points 2, 3, 4, &c. From each of these points set off half the width of a scallop each way and draw its outline tangent at the middle to the outer circle, as shown. To complete the side view first project lines from the middle point of each scallop or point of tangency just mentioned to intersect with the line A B, as shown at *a*, *b* and *c*, and from the two inner points of each scallop on the circle E 5 project lines cutting the line C D of the side view, as shown by dotted lines. From the points thus obtained the outlines of the scallops may be drawn through the points just obtained on A B, as shown.

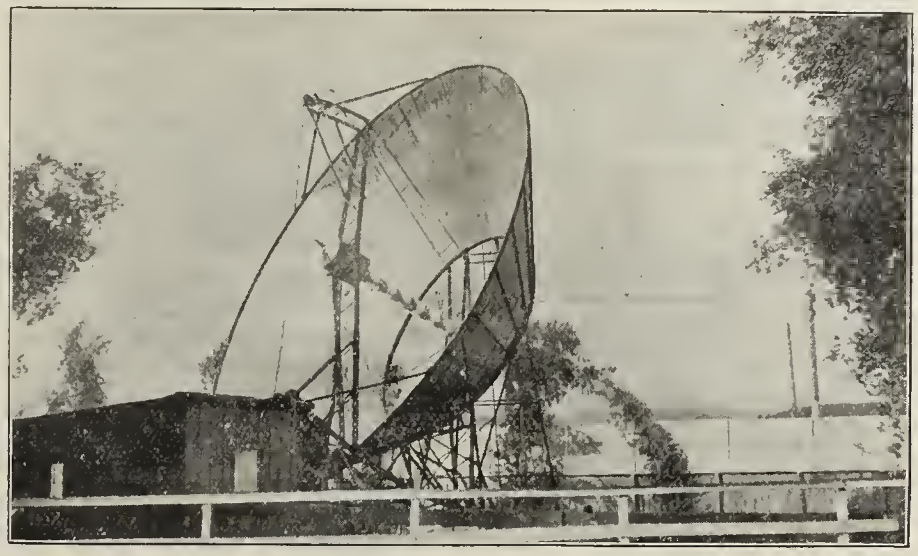
Since the surface at the edges of the rosette is oblique to the plane of the view, the outlines of the scallops, though intended to be circular, must appear elliptical, because the oblique projection of a circle is an ellipse. The ellipses are more flattened in the front view than they are in the side, because the angle of the metal is more oblique to the plane of that view than to that of the side view. The correctly drawn elevation now shows that the circle forming the bases of the scallops is much greater in diameter than the corresponding circle of Fig. 1, whose radius is *a*, and that therefore the scallops must either be larger or be further apart than shown in Fig. 1.

With reference to a pattern for a blank, it will now be seen that a full stretchout of the profile A Y B would, if set off on the vertical line, reach from A¹ to B¹, giving a diameter of nearly 5½ inches. This distance must of course be reduced by the amount which, in the judgment of the workman, the metal will stretch with the hammering necessary to produce the curve of the profile. A radius equal to the chord of A Y or B Y would be a safe estimate for a blank upon which a circle whose radius is somewhat less than the chord C Y may be drawn as the base of the scallops. These dimensions will, of course, have to be verified by experiment, as explained above. Unless it is desirable to cut the scallops before raising, they can most easily be outlined upon the dished blank by a carefully trimmed template or pattern.

Two or three blanks may be raised at one time during the first part of the operation, provided sufficient metal be left on the blank outside the outline at three or four points to permit notching and the turning under of some points or lugs to bind the several pieces together while being hammered. Each piece must, however, be finished separately to insure uniformity of size. A raising hammer weighing from 2 to 2½ pounds will be best adapted to the work.

PAINT FOR ROOFING.

From G. B., Iowa.—In regard to the query of "W. E. J." of June 14, I would say that I think any mineral paint mixed not too thin with linseed oil, and applied in two or three coats, makes about as good a paint for tin roofing and valleys as can be got. I have seen Venetian red adhere so firmly to a tin roof that it could hardly be scraped off; it seemed as if coated with a layer of stone. I would like to hear the opinion of others on this subject, however.



A Solar Motor.

A QUESTION OF WATER PRESSURE.

From S. J. H., Warren, Minn.—Will you please inform me through the columns of *The Metal Worker* what is the difference of pressure, if any, of water thrown by a fire engine at the time of leaving the engine and at the nozzle when using, say, from 200 to 500 feet of hose?

Answer.—The friction in long lines of hose is very considerable and is one of the great drawbacks in fighting fires through many lengths of hose. With the standard size of hose, to maintain a ⅞-inch nozzle jet of 100 feet in hight, which would require 60 pounds pressure if thrown from the engine, would require 65 pounds at the end of 50 feet, 69 pounds at 100 feet, 75 pounds at 200 feet, 89 pounds at 400 feet and 97 pounds at 500 feet of rubber lined hose. With a ¾-inch nozzle the difference will be less, about in proportion to the difference in the area of the nozzles, or, say, 36 per cent. With less engine pressure than 60 pounds the difference in pressure at the ends of the hose will also be proportionately less than above stated.

A Solar Motor.

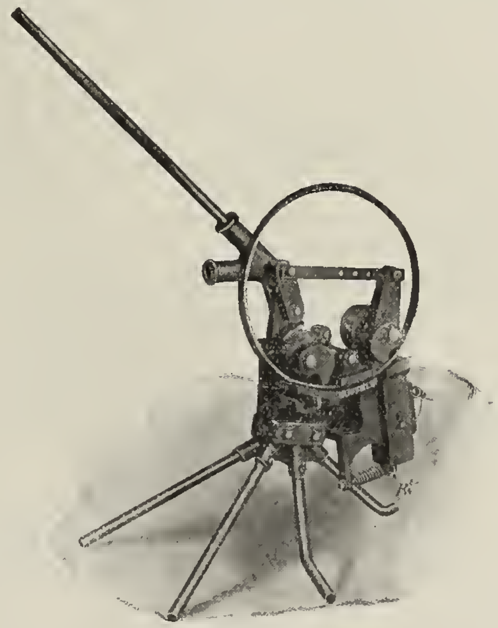
In a recent issue of this paper appeared an article on the solar motor in operation at an ostrich farm in South Pasadena, Cal. Through the courtesy of Hill, Clarke & Co. of Chicago we are enabled to present herewith a picture of this interesting machine which appeared in *Shop Talk* for May, with the following comments:

The resemblance to a huge umbrella is quite striking, with the boiler in the center taking the place of the somewhat sawed off stick. The rings of light reflected from the 1788 mirrors upon the boiler are quite plainly discernible. All day, every day, from an hour after sunrise to half an hour before sunset, this automatic servant turns its face toward the bright California sun and quenches the parched thirst of the dry soil with cooling streams of water.

It is thought probable that solar motors will some time be as common on all arid plains and scorched deserts as wind mills are in Holland to-day. Under the desert sand there are often great water reservoirs which only need tapping to enable the desert to be converted into fertile pasture land. In California and Arizona alone there are millions of acres awaiting such redemption.

Buffalo Tire Upsetter.

The Buffalo Forge Company, Buffalo, N. Y., to whom the progress and advancement in blacksmith machinery is largely due, have recently placed on the market their new Buffalo tire upsetter, an illustration of which is given herewith. This tool, after extensive and thorough experiments, has demonstrated itself to be a very practical and efficient device. The central presser foot holds the tire rigidly in place, and effectually prevents all possibility of kinking of the tire during the process of shrinking. The clamps have corrugated jaws. The corrugations and the bed on which the tire rests are of the best chilled metal, and grip the tire with great power and tenacity. By means of the long handle, as shown in the accompanying illustration, ample leverage may be obtained. By a simple arrangement, three adjustments are provided to accommodate the upsetting of various sized tires. Another valuable feature of this machine is the spring attachment of the outer lower jaw. This spring, as soon as the pressure is removed, immediately draws the lower jaw back into place, releasing the tire. The base is of the spider leg arrangement, which affords a rigid and strong means of support. The prime points of merit of this tool are its adaptability, simplicity of construction and high power, so combined as to readily accomplish any work required of it.



Buffalo Tire Upsetter.

TRADE REPORT.

MARKET SUMMARY.

Pig Tin is weak and about ½c. lower.

Copper is dull and weak.

Pig Lead continues quiet and steady.

Spelter continues very strong for spot and in fair demand.

Antimony is about ¼c. higher.

Nickel is in good demand and without change in price.

Aluminum is firm and in good demand.

Tin Plates are quiet, with prices unchanged.

Black Sheets are firm and in good demand in the heavy gauges.

Galvanized Sheets are rather dull and not so strong as Black.

Scrap Iron is active and firm.

Scrap Brass and Copper are dull and weak.

Foundry Iron gets scarcer daily, with prices high and rising.

Sheet Copper is in good demand at unchanged prices.

Sheet Zinc has been advanced ½c. per lb.

Hardware is not so active, but the volume of business is large and prices are firm.

Plumbers' Brass Work is about 2½ per cent. higher.

Roofing Slates are scarce, and from 50 to 75 cents per square higher in price.

Refrigerators are in heavy demand; prices are expected to be higher next season.

Hot Air Registers are firmer in price.

Wire Nails are firm and in good demand.

Cut Nails are unchanged.

White Lead in Oil is more active, and prices are firm.

Spirits Turpentine is quiet and firm.

METAL MARKET.

New York, June 27, 1902.

Pig Tin.—The market for Pig Tin has been a fluctuating one throughout the entire week, and the tendency of prices has been toward a lower level. At the end of last week prices were forced up to the highest point, but a reaction set in on Monday, since which date, after some feeble rallies, the market each time has settled back a little lower. Buying has been on a very light scale and the market closed dull with an easy tone. Jobbers' prices rule about ½ cent lower than a week ago, Straits Pig in small lots being quoted at 29½c. to 30c. per lb.

Copper.—The market for Copper has been very weak and wholesale prices have declined. The demand for consumptive needs was very quiet. Speculative trading, however, was quite active and some heavy business in that line was transacted. The market closed dull and easy. Jobbers quote Lake Ingot in small lots at about 13c. per lb., and Casting Copper at 12¾c.

Sheet Copper.—The demand for Sheet Copper keeps up in fairly large volume, but the volume of orders is scarcely as heavy as it was in the early part of the month. Prices continue firm on the basis of 18c. per lb. from store.

Pig Lead.—There is no change to be noted in this market, which remains quiet but steady, with prices continuing on the level held for some time past. American Pig, in small lots, is quoted at 4.45c. to 4½c. per lb. St. Louis advices report a dull market for Pig Lead, with the price-list showing little or no variation during the week.

Spelter.—This metal continues very firm, with a fair amount of business doing. The Spelter supply is still quite limited and prices are on the up grade. Jobbers are quoting 5¼c. to 5½c. per lb. for small lots of good Western Spelter. St. Louis advices report the continuance of unsettled conditions in the Spelter market there, with transactions very much restricted and prices strong.

Sheet Zinc.—The manufacturers of Sheet Zinc on June 25 announced an advance of ½c. per lb., making 6¾c. per lb. for 600-lb. lots, and from 7¼c. to 7½c. for smaller quantities. The demand for Sheet Zinc is of average proportions.

Antimony.—This metal is firmer, owing to a sharp advance in London. Cookson's is quoted at 10½c. to 11c. per lb. in small lots, Hallett's at 8⅞c. to 9c., and U. S. at 8½c. to 8⅝c.

Nickel.—There is no change in the market for this metal. Small lots are quoted at about 55c. per lb.

Aluminum.—The demand continues active, and prices are without change. Small lots of No. 1 Ingot, guaranteed 99 per cent. pure, are quoted at 37c. per lb., and 100-lb. lots at 35c.

Tin Plates.—The market for Tin Plates continues dull and uninteresting, without change of any description. Only a small amount of business for present delivery is noted, and but little in the way of contracts for future delivery. Prices remain steady, and the supply is of fairly good proportions. American Bessemer Coke Plates, IC, 14 x 20, in moderate sized lots, delivered at New York or corresponding points, are quoted by jobbers at $4.75 to $4.90 per box.

Sheets.—A slightly better demand for Black Sheets is reported, but Galvanized are rather dull, and it is said that prices on the latter have eased off slightly in some quarters. They continue firm, however, in the New York market. So much new capacity in Sheets is coming into the market and the output is now so large that any let up in the demand would probably be followed by weaker prices. The shortage of fuel and other material, however, is likely to cause some hindrance to a full output, which may counteract any tendency toward a lower level of prices in the general market. Heavy Sheets are relatively much more active than Light Sheets. Jobbers quote No. 27 One Pass Cold Rolled Soft Steel Sheets at about 3.75c. to 3.80c. per lb., and No. 24 Galvanized at 4c. to 4.20c.

Chicago advices are as follows: The market for Heavy Sheets has remained firm, with full prices readily obtained, but Light Sheets have been slow and barely steady, Galvanized Sheets being especially quiet. No. 27 Black Sheets in small lots from store are quoted at 3.45c. to 3.55c. Galvanized Sheets, net prices, in small lots from store rule at 4.70c. to 4.75c. for No. 27.

Old Metals.—The demand for Scrap Iron is active and prices firm, but other Old Metals are dull, and, in some cases, weak and lower, as, for instance, Scrap Brass and Copper. Dealers are paying about the following rates for moderate sized lots, delivered at New York or corresponding points:

Heavy Copper	per lb.	10 c.
Light and Tinned Copper	per lb.	9 c.
Heavy Brass	per lb.	8 c.
Light Brass	per lb.	6½c.
Lead	per lb.	3⅝c.
Tea Lead	per lb.	3 c.
Zinc	per lb.	2⅞c.
Pure Aluminum Sheet	per lb.	22 c.
Cast Aluminum	per lb.	17 c.
No. 1 Pewter	per lb.	18 c.
No. 2 Pewter	per lb.	9 c.
Tin Plate Scrap, per gross ton		.... to $5.00
Wrought Iron Scrap, per gross ton		$13.00 to 13.50
Heavy Cast Scrap, per gross ton		12.00 to 12.50
Stove Plate Scrap, per gross ton		8.50 to 9.00
Burnt Iron, per gross ton		7.00 to 7.25

The H. Haller Mfg. Company of New Orleans, La., manufacturers of Tinware and Stamped Goods, have disposed of their factory and business to the National Enameling & Stamping Company. It is stated that the New Orleans factory will be used mainly for the manufacture of Tinware for the West Indian and Central and South American markets.

THE PIG IRON MARKET.

New York.—The only business which is transpiring in this market is for small lots for prompt delivery, which continue exceedingly scarce and command high prices. Quotations for summer delivery are as follows: Northern Iron, at tidewater, No. 1 X, $23.50 to $25; No. 2 X, $22.50 to $23.50; No. 2 Plain, $21.50 to $22. Tennessee and Alabama brands are quoted as follows: No. 1 Foundry, $22.50 to $23.50; No. 2 Foundry, $21.75 to $22.50; No. 3 Foundry, $21 to $21.25.

Chicago.—Further buying for 1903 delivery has been the prominent feature of the market during the week, about 20,000 tons in the aggregate having been sold for delivery during the first six months of next year. Individual transactions, however, have not been large. Stove founders and general foundrymen have been among the buyers, but as a rule the large buyers are still indisposed to contract largely for next year. A little Southern Iron has been sold on the basis of $17.50 to $18, Birmingham, on No. 2 Foundry. Both Northern and Southern furnaces show some disposition to sell for next year, and if any change is apparent it is a somewhat easier undertone. For the latter half of this year, however, the market is as strong as ever. Local Iron is still tending upward, especially No. 2, which is 50c. per ton higher at the close. Spot Iron is even more difficult to obtain. There is some urgency in the demand from founders in this section. For immediate delivery prices are still irregular, sales being made, as a rule, at 50c. to $1 per ton above quotations, and in some instances even higher prices are obtained. We quote as follows:

Lake Superior Charcoal	$24.00 to $25.00
Local Coke Foundry, No. 1	22.00 to 22.50
Local Coke Foundry, No. 2	21.50 to 22.00
Local Coke Foundry, No. 3	21.00 to 21.50
Local Scotch, No. 1	22.00 to 23.00
Ohio Strong Softeners, No. 1	24.00 to 24.50
Southern Silvery, according to Silicon	22.65 to 24.65
Southern Coke, No. 1	22.15 to 22.65
Southern Coke, No. 2	21.65 to 22.15
Southern Coke, No. 3	21.15 to 21.65
Southern Coke, No. 1 Soft	22.15 to 22.65
Southern Coke, No. 2 Soft	21.65 to 22.15

Philadelphia.—Quotations on Pig Iron are very erratic, circumstances in each case determining what price the seller will name. No large lots can be had at any price for July or August delivery, but for carload lots —50 to 100 tons—$23 for No. 2 X Foundry, and $22 to $22.50 for No. 2 Plain are the figures demanded, and in some cases still higher prices have been obtained. The last quarter of the year is also very closely sold up to; $22 to $22.50 for No. 2 X is as low as sellers are inclined to quote. A very considerable business has been done for deliveries during the first half of next year at $21.50 to $22 for No. 2 X. Fair average prices for city and nearby points or deliveries during the last half of the year are as follows, July, August and September deliveries being from $1 to $2 higher:

No. 1 X Foundry	$23.00 to $23.50
No. 2 X Foundry	22.00 to 22.50
No. 2 Plain	21.50 to 22.00

Pittsburgh.—While the Pig Iron market is somewhat quiet so far as sales are concerned, prices are very strong, and there is more difficulty than ever in getting deliveries. The greater part of the product of the furnaces for the balance of this year is under control, and there is very little Iron to be had. The market on No. 2 Foundry for shipment within the next three months is all of $22.50 to $22.75, Pittsburgh.

Cincinnati.—The general situation in Pig Iron, so far as immediate delivery is concerned, is unchanged. Iron for delivery between now and January is still very scarce. The present supply is limited to odd lots, which come from unexpected sources, and are bringing almost anything sellers are inclined to ask. It is not believed that there is any Iron to be had for any delivery this year on a lower basis than $18.50, Birmingham, for No. 2 Foundry, and the majority of sellers are holding to $19. We quote, f.o.b. Cincinnati, for 1902 delivery as follows:

Southern Coke, No. 1	$21.75 to $22.25
Southern Coke, No. 2	21.25 to 21.75
Southern Coke, No. 3	20.75 to 21.25
Southern Coke, No. 4	20.25 to 20.75
Southern Coke, No. 1 Soft	21.75 to 22.25
Southern Coke, No. 2 Soft	21.25 to 21.75
Ohio Silvery, No. 1	24.10 to 24.35
Ohio Silvery, No. 2	23.60 to 24.10
Lake Superior Coke, No. 1	24.60 to 25.10
Lake Superior Coke, No. 2	24.10 to 24.60
Lake Superior Coke, No. 3	23.60 to 24.10

St. Louis.—No new features are noted in the Pig Iron market at this point. The matter of price is rather a difficult problem to determine. Actual transactions are very light and any lots of Iron for quick delivery that can be offered are snapped up at the sellers' own terms. A distinctly hardening tendency is noticeable and any further developments in the Coke situation affecting the Virginia supply will, it is feared, bring about an acute stage in the market. The following is the range of prices for cash, f.o.b. St. Louis:

Southern, No. 1 Foundry	$20.50 to $23.25
Southern, No. 2 Foundry	19.75 to 22.50
Southern, No. 3 Foundry	19.25 to ....
Southern, No. 4 Foundry	18.75 to 21.50
No. 1 Soft	20.25 to 23.00
No. 2 Soft	19.75 to 22.50

CHICAGO REPORT.

Scrap Iron and Steel.—The market is firmer in tone, with a good demand and moderate offerings. Malleable Scrap is especially scarce and commands higher prices, but other kinds are without essential change. We quote dealers' prices for carload lots, Chicago delivery, as follows:

	Per net ton.
Country Wrought Scrap	$14.00 to $14.50
Machinery Cast	.... to 13.00
Malleable Cast	12.00 to 13.00
Stove Plate (free from burnt)	.... to 9.50
Burnt Iron and Grate Bars	8.00 to 9.00
Sheet Iron and Hoops	8.00 to 9.00
Plow Steel	12.00 to 13.00
Breaking Stock	.... to 11.00
Old Boilers—whole (Iron)	9.50 to 10.00
Old Boilers (Iron) cut in single Sheets and Rings	12.00 to 12.50
Old Gas Pipes and Boiler Tubes	12.00 to 12.50
Cast Borings	8.50 to 9.00
Turnings	12.00 to 12.50
Horseshoes	14.00 to 14.50

Old Metals.—A weaker tone has been developed, and while offerings are not large they are more than ample to meet the decreased demand. Prices of Copper and Light Brass are lower. Other kinds are quiet but steady. The following prices are being paid by dealers in this market:

	Per lb.
Copper Wire and Heavy	10¾c.
Copper Bottoms	9¾c.
Copper Clips	10½c.
Red Brass	11 c.
Yellow Brass	8¼c.
Red Brass Borings	10 c.
Yellow Brass Borings	7½c.
Light Brass	6¾c.
Pipe Lead	3.70c.
Tea Lead	3.35c.
Zinc	3⅛c.
Tin Foil	22 c.
Pewter, No. 1	19 c.
Pewter, No. 2	11 c.
Aluminum	20 c.

Old Rubber.—The offerings to dealers have been less liberal, but the outlet has not improved, and the market has remained steady at previous prices. The following are the prices paid by dealers in this market:

	Per net ton.	Per lb.
Garden Hose	$25.00	.....
Air Brake Hose	42.00	.....
Rubber Shoes	....	7 c.
Rubber Car Springs	....	5 c.
Inside Bicycle Tubing	....	22 c.
Outside Tubing	....	6 c.
Black Rubber	....	4 c.
White Rubber	....	8½c.

Rags.—The market has been well supplied and an easy tone has prevailed, but dealers have continued to buy desirable offerings at 70c. to 75c. per 100 lbs., Chicago delivered.

Anthracite Coal.—There is a scarcity of the smaller sizes, and with a good demand and no improvement in the outlook at the mines, the market has continued strong. There has been a fair movement on contracts and prices have remained strong at the previous schedule, subject to a discount of 30c. per ton for shipments made during the month of June:

	Grate.	Egg and Stove.
Chicago	$5.75	$6.00
Milwaukee, Wis.	5.75	6.00
St. Louis	6.20	6.45
Kansas City, Mo	8.25	8.50

The Detroit Brass Works of Detroit, Mich., have bought ¾ acre of ground adjoining their plant, which they will use for an extension to their factory.

THE HARDWARE TRADE.

The attention of the trade is divided now between matters connected with the closing up of the half year's business, the entrance on the vacation season and plans for the remaining months of the year. Notwithstanding the natural effect of the coming of one of the dullest months of the year we have to report a very satisfactory condition of business, with a liberal placing of orders for future requirements. There has, indeed, been within the past week an increase in the volume of current trade, as the larger houses are at the present time apparently placing a good many orders with the manufacturers and endeavoring to secure a prompt and sufficient supply of goods for fall sales. The tenor of reports from the principal centers is very satisfactory. The general trade feeling is certainly confident, and anticipations are freely expressed of a large and profitable fall business unless something unexpected occurs to interfere with the present excellent outlook. Manufacturers, as a rule, are full of orders, and most of the factories find difficulty in making shipments with even reasonable promptness. The tone of the market in the matter of prices is steady, and in some lines strong. There are only occasional indications that some parties have been ordering goods in excess of their requirements, apparently apprehensive that they might experience difficulty in having them executed, and in some cases they are asking that shipment be deferred. The changes in price are few, and, for the most part, in heavy goods which lie near the raw material. The export of hardware and related products is somewhat affected by high prices ruling, and somewhat diminished quantities are going abroad.

NOTES ON PRICES.

Plumbers' Brass Work.—Under date of June 23 the members of the Association of Manufacturers of Plumbers' Brass Work withdrew all quotations on Plumbers' Brass Work. A meeting of the association was held at the Cataract Hotel, Niagara Falls, on June 25, at which an advance in prices was advocated by the Western members of the association. The condition of the Brass market in the East is such that the Eastern members were not in sympathy with the movement to advance prices, and as a consequence the meeting was continued on the 26th. It is understood that a slight advance in prices was agreed upon, and that Flange and Thimble Competition Work was restored to the list. For some time past this class of work has not been quoted on by the association, as many concerns who have been making a specialty of this line alone were not members of the association. Several of the outside concerns have stopped manufacturing Flange and Thimble Work, owing to the lack of demand, which was brought about through the dulness of trade in the metropolitan district, where the majority of this class of work is used. In consequence of the withdrawal of the outside concerns from the market new prices will be announced, and this line will be again restored to the list of goods quoted on by the association.

Enameled Iron Bathtubs.—It was stated this week that a movement is on foot to interest the independent manufacturers of Cast Iron Enameled Goods. It is said to be the intention of the promoters of the scheme to interest all those who are outside of the leading manufacturing concern, in forming an organization which would be of mutual benefit to all concerned, the purposes of which are to enable the members to obtain better prices for their products, to correct many abuses which now exist in this line of business, and to set a uniform guarantee which shall be used by all the manufacturers of Enameled Iron Goods. Several prominent Western manufacturers of Enameled Iron Goods are said to be agitating the movement, and if a sufficient number of manufacturers think favorably of the project, a meeting is likely to be called at some point which will be within easy access to the greater number of those interested.

Fall Goods.—A considerable increase is reported in the placing of orders for fall delivery of such goods as Stove Boards, Elbows, Coal Hods, Lanterns, &c. Prices on all these lines appear to be very firm and a heavy business is anticipated.

Refrigerators.—The season's demand for Refrigerators is referred to as unusually large and the prices obtained have been generally remunerative. The manufacturers of Refrigerators are said to be considering an advance in the price of these goods for next year.

Hot Air Registers.—A firmer tone has been developed in the market for Hot Air Registers and Ventilators, owing to the active demand and the high cost of iron. Some of the manufacturers who have been making relatively low prices on these goods are now said to be naming stiffer figures. The general market for Registers in the East is firmer and the tendency of prices throughout the trade is decidedly upward.

Wire Doors and Screens.—The demand for Wire Doors and Window Screens is still quite heavy, and the supply of these goods is short in some quarters, manufacturers not being able to get out their full product, owing to difficulty in getting enough supplies of Wire. Prices are very firm in this line.

The Southard-Robertson Company, 257-259 Water street, New York City, announce, under date of June 20, that owing to the increased cost of production in the manufacture of Stoves and Ranges they have been forced to withdraw all previous quotations, and that on and after the date named an advance of 5 per cent. will be charged on their line of Stoves, Ranges and Heaters.

Wire Nails.—The store demand for Wire Nails in New York continues active, owing to the large amount of building in the territory tributary to this point. Prices are unchanged, small lots from store being quoted at $2.30 per keg. Stocks of Nails are beginning to accumulate at the mills and a number of the mills will take advantage of this condition to close in July for the annual repair and clean up, which is required after a year's continuous operation.

Cut Nails.—Requirements for Cut Nails in the local market are about in the usual proportion to Wire Nails. The scarcity of Cut Nails continues in a modified degree, but less trouble is experienced than for some time in getting prompt shipments. Small lots of Cut Nails from store rule at $2.30 per keg.

White Lead.—There has been a better demand again for White Lead in Oil, stimulated by the cooler weather. Manufacturers are now looking forward to their fall trade, which they expect will be large. Prices are firm and without change. Small lots of White Lead in Oil from store being quoted at 6½ to 6¾ cents per pound.

Spirits Turpentine.—The price of Turpentine remains too high at this point to tempt the larger buyers, so that business is restricted to jobbing lots. Prices are firm, Turpentine in small lots being quoted at 50 to 50½ cents per gallon.

Roofing Slates.—In another column we present a review of the Roofing Slate market, showing the condition of strength that now prevails in it. Prices on all grades of Slates have been advanced from 50 to 75 cents per square in the past week or two, and there are indications of further advances in the near future, caused by a sharp scarcity in the present supply, with an indication of becoming still more pronounced as the season progresses, the demand for Roofing Slates being exceptionally heavy and the available stocks unusually light.

John A. Walker, vice-president and general manager of the Joseph Dixon Crucible Company, Jersey City, N. J., and 64 Reade street, New York, sailed for Europe on the "Kaiser Wilhelm der Grosse," June 17, for a six to eight weeks' tour of Europe. While he will get some pleasure from the trip, the principal purpose of it is to visit their London branch and the various Dixon agencies on the Continent.

A block of granite weighing over 2000 tons has been blasted in a Devonshire quarry by a single charge, consisting of 40 pounds of powder.

TRADE NOTES.

The American Galvanizing Works, 1243 Fillmore street, Chicago, have issued a pamphlet, tabulating the various sizes, lengths and quality of Galvanized Angles, equal legs; Angles, unequal legs; Round Back 60-Degree Angles, Galvanized Flat Bars, Galvanized Bands and Scrolls, Galvanized Round Bars and Channels, used especially in the manufacture of Wind Mills and Tank Towers.

The National Enameling & Stamping Company, New York City, have declared a quarterly dividend of 1¾ per cent. on the preferred stock and 1 per cent. on the common, payable July 1.

Work has been started on the large three-story factory building for the Eaton, Cole & Burnham Company on Main street, Bridgeport, Conn. The company are also about to put up a frame addition to their foundry.

The Waterbury Brass Company, Waterbury, Conn., are tearing down a number of old buildings preparatory to the erection of a large addition to their plant. The new building will be 150 x 200 feet, constructed of brick.

The Elkhart Brass Company of Elkhart, Ind., have been incorporated with a capital of $12,500 by Herbert E. Bucklen, William H. Anderson, Albert E. Hansen, Frederick A. Reed and Louis Anderson.

The Kirk-Latty Mfg. Company, Cleveland, Ohio, manufacturers of Bolts, Nuts, &c., advise us that they have purchased the manufacturing assets, tools, machinery, good will, &c., of the Metal Goods Mfg. Company of Cleveland, Ohio, and have taken up the manufacture of that company's line of children's All Steel Express Wagons, Velocipedes, Wheelbarrows, &c. The Kirk-Latty Company have just completed very extensive additions to their manufacturing plant more than doubling its capacity, and they believe that their reputation as one of the largest and most successful Bolt and Nut manufacturing concerns in the United States should assure the trade that their newly acquired line, above indicated, will be absolutely first class in quality, and that they will not only perpetuate the reputation always held by the Metal Goods Mfg. Company's line, but will improve upon the same where improvements are found possible.

The Noera Mfg. Company, Waterbury, Conn., have issued a new catalogue, No. 9, covering their line of Oilers, Torches, Lamps, Lawn Sprinklers, Water Filters, &c.

Rome Mfg. Company, Rome, N. Y., manufacturers of Nickel Plated and Polished Copper Specialties, have established a European agency in charge of William Cruger Cushman, 19 Chapel street, London, E. C.

The Canton Foundry & Machine Company, Canton, Ohio, have completed plans for a three-story 50 x 150 foot addition to their plant. Contracts will be closed at once.

The Wilke Mfg. Company of Anderson, Ind., are building a glass lined Refrigerator for the ocean going yacht of W. L. Mellon, Pittsburgh. This Refrigerator will be of solid mahogany exterior, completely lined with ½-inch plate glass; all hardware and trimmings will be of special design in polished lacquered brass.

More than $50,000 will be expended in enlarging the yards and plant of the National Enameling & Stamping Company at Granite City, Ill. Nearly an additional block will be taken in by the improvements.

The United States Consul-General at Coburg, Germany, reports that there is a good opening for American Refrigerators in that country, especially in the smaller and cheaper kinds. A couple of years ago a large New York house sent a quantity of Ice Boxes and Chests to the Leipzig fair, where they created a great interest. They sold well and the prospects of trade were excellent, but the manufacturers made the mistake of putting their goods into the hands of a firm in another city who understood nothing about the handling or use of Refrigerators. As a result no business was done.

A dispatch from Washington says that the expected increase in American exports to Africa has begun. Our exports to that country in April, the latest month for which details have been received by the Treasury Bureau, were greater than those to all South America and were more than 50 per cent. larger than the exports to Africa in April, 1901. For the ten months ending with April, 1902, they amounted in round numbers to $29,000,000, against $22,000,000 for the corresponding months of the fiscal year 1901, and $15,800,000 for the corresponding months of 1900. The chief increase is to British South Africa, and it is expected that the shipments of American goods to that part of the "Dark Continent" will show steady increases from month to month in the immediate future.

George Harbin of Youngstown, Ohio, has been appointed district vice-president of the Amalgamated Association to fill the vacancy caused by the recent resignation of John F. Ward.

C. B. Smith has succeeded J. H. Markel in the retail Hardware, Stove and Tinware business at Shrewsbury, Pa.

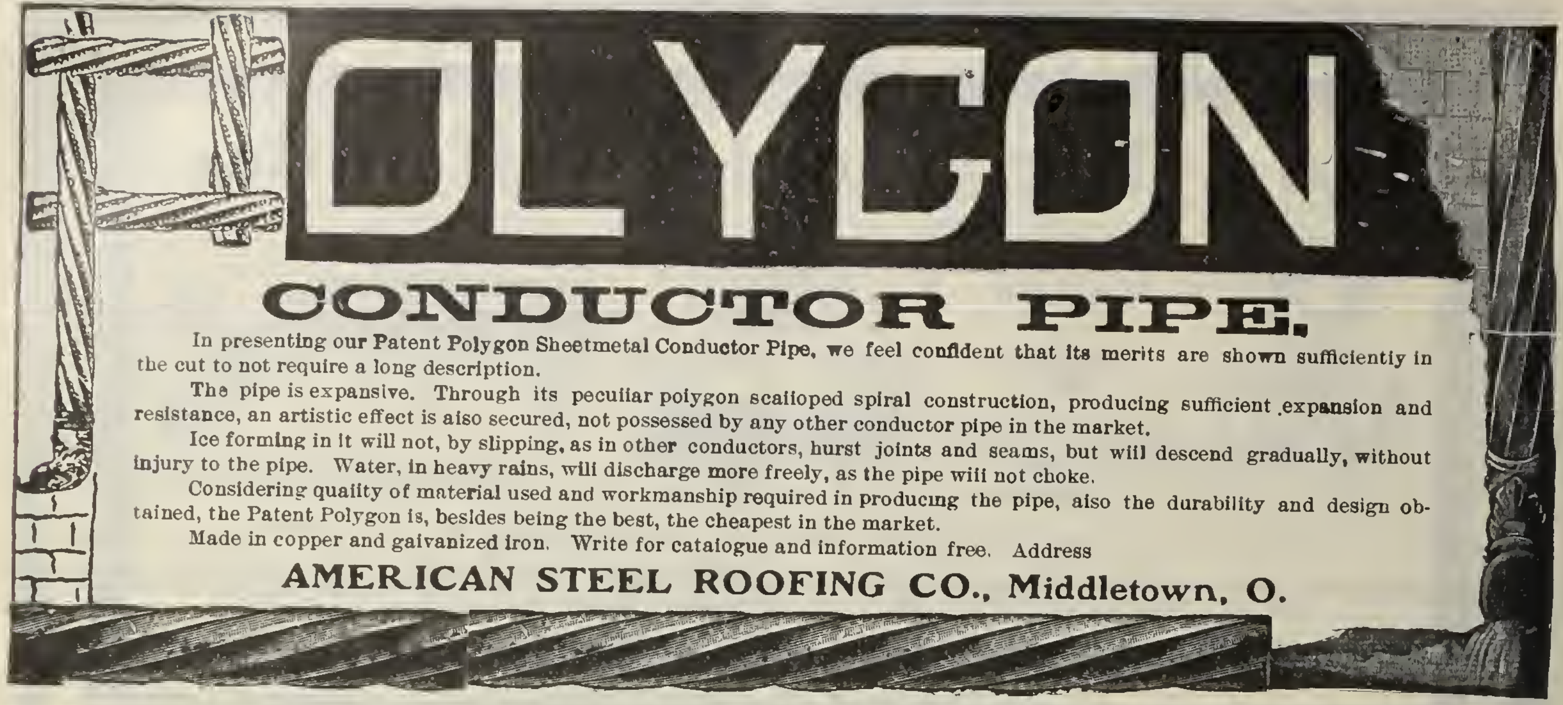
ART MODELING WORKS,
832 Market St., Camden, N. J.



POLYGON

CONDUCTOR PIPE.

In presenting our Patent Polygon Sheetmetal Conductor Pipe, we feel confident that its merits are shown sufficiently in the cut to not require a long description.

The pipe is expansive. Through its peculiar polygon scalloped spiral construction, producing sufficient expansion and resistance, an artistic effect is also secured, not possessed by any other conductor pipe in the market.

Ice forming in it will not, by slipping, as in other conductors, burst joints and seams, but will descend gradually, without injury to the pipe. Water, in heavy rains, will discharge more freely, as the pipe will not choke.

Considering quality of material used and workmanship required in producing the pipe, also the durability and design obtained, the Patent Polygon is, besides being the best, the cheapest in the market.

Made in copper and galvanized iron. Write for catalogue and information free. Address

The Finishing Touch

to a building estimate is to specify M F Roofing Tin. It is the best roofing material—perhaps just a little more costly at first; but it will last more than half a century; will not rust, or leak. It is the world's standard for roofing tin.

M F Roofing Tin

is made by the old-style hand process. It carries the heaviest coating of pure tin and new lead. Every sheet is carefully inspected and only perfect plates sold. This Ⓜ mark stamped on every sheet. Ask your roofer, or

SIT DOWN AND THINK.

Every successful business man thinks—thinks dollars. Does there ever come to your mind a possible error in buying judgment? Is it not possible that some goods possess merits over others? Do not some move faster than others? Is it the fault of the goods? Can't you remedy it? Have you tried?

We believe in progress. Speaking of ceilings, we lead in variety of patterns. We are to-day the only ones prepared to furnish complete Classified Designs in harmony with leading styles of architecture.

If you want estimates on prospective work send sketch and measurements of space to be covered and we will submit designs and prices.

Remember, we make everything in the metal line. Why not give us a chance?

JANNEY, STEINMETZ & CO., Drexel Bldg Philadelphia.

The New Metal Worker Pattern Book.

425 Pages. 744 Illustrations.
Size 10 x 13 Inches.

A new treatise on pattern cutting as applied to all branches of sheet metal work.

Cloth Bound, Price $5.

This work contains a collection of 218 problems and an elaborate explanation of the principles of pattern cutting, including Triangulation.

It embodies the problems of the former Metal Worker Pattern Book, all of which have been revised, and many of which have been entirely rewritten and solved by more approved methods. To these have been added 75 new problems and much other new material and explanatory matter, making this work a model of completeness in every respect.

ARRANGEMENT.

In point of arrangement the new work far surpasses the former one in that the problems are classified under three different heads, and simply indexed, and also that by means of a table of contents any required department of the work can be easily found.

CONTENTS.

While Chapter VI, comprising the greater part of the work, is devoted to the solution of problems, the five preceding chapters thoroughly explain the principles of pattern cutting, and place the student in possession of the preliminary information necessary to a thorough understanding of the subject.

SUMMARY OF CONTENTS.

I. Terms and Definitions—15 pages.
II. Drawing Instruments and Materials—13 pages.
III. Linear Drawing—6 pages.
IV. Geometrical Problems—35 pages.
V. PRINCIPLES OF PATTERN CUTTING—25 pages.
VI. PATTERN PROBLEMS (3 Sections)—325 pages.
  1. MITER CUTTING.
  2. FLARING WORK.
  3. TRIANGULATION.

All Tinners, Cornice Makers and Sheet Metal Workers should be provided with a copy of

HERCULES SHEARS

make the cntting of sheet metal of heavy gauges an easy task for the mechanic and a profitable operation for the employer. With them a man can cnt No. 12 steel with one hand on the lever, leaving the other hand free to guide the stock while cutting elbows, ties and circles, as small as 8 inch radius; this is done without burring or buckling either piece, thus avoiding hammering and straightening, which add to the cost of the product. They split sheets of any width or length up to No. 12 gauge, cut wire or bar-steel ⅛ inch thick, cut off and mitre angle iron ⅛ inch thick, and do it perfectly.
